3.0489, AN INTERFEROMETRIC INVESTIGATION OF TRANSPORT PHENOMENA IN PARTIAL PRESSURE DISTILLATION

M.M. ELWAKIL, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

The study will be both experimental and analytical. A dual wavelength interferometric technique which does not physically interfere with the boundary layers will permit measurements of very low heat and mass transfer rates from measured temperature and concentration gradients at the walls. In addition, the interferograms will show the shape and extent as well as development of boundary layers. The most promising approach to further analytical studies now appears to be through the application of finite difference techniques to solution of the boundary layer regime, and a study of the effects of geometry on boundary layer development. The experimental studies will include the construction of an evaporator-condenser of variable geometry to fit within the bounds of the interferometric set up.

The air-water vapor system of interest in sea water demineralization processes will be studied, and the best method of solutions for temperature and concentration gradients determined. It may be necessary or desirable to consider systems other than water and air in order that reasonable accuracy may be obtained on both temperature and concentration gradients; selection of systems will be based on molecular mass, vapor pressure, indices of refraction and other considerations so that meaningful results can be interpreted in terms of the air-water system. There is also the possibility of modification of the experimental techniques, for example by use of porous evaporator plate rather than a falling water film.

3.0490, SOIL CONSERVATION AND FERTILITY OF RED CLAY AND PRAIRIE SOILS OF WISCONSIN

A.E. PETERSON, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

To determine the most profitable and satisfactory soil management practices for crop production and soil conservation. The eastern red clay area will be concerned with the effect of

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

various rotations and soil tillage practices on soil and water loss. The northern red clay soil studies will determine the feasibility of establishing seeding on farm waterways, gullies, and stream bank slopes using a combination of bituminous mulches, soil stabilizers, seeding mixtures and fertility treatments. The prairie soils studies will include effect of minimum soil tillage on continuous corn cultural studies which include various population, maturity and fertility levels. The effect of various methods of minimum soil tillage on pasture renewing will be included.

DESCRIPTION OF WORK: In the red clay area soil and water loss measuring equipment will be installed on 20 acres of land near Valders, leased by Maintowoc County. Some of the measuring equipment has been provided by the Soil and Water Conservation Sections of the Agricultural Research Service, U.S.D.A. Waterway, and stream bank stabilization will be conducted at the Ashland Experiment Station and in the nearby Whittlesey Watershed in cooperation with the Wisconsin Conservation Department, the Whittlesey Watershed group and the Soil Conservation Service on the prairie soils, cultural studies of corn using 4 populations (13,000, 16,000, 19,000 and 22,000 plants), six corn varieties and three fertility levels, will be studied in conjunction with minimum soil tillage (wheel track planting). Pasture renewal studies using herbicides and minimum tillage methods of planting both small grain (plow press grain drill) and corn.

3.0491, TRAINING, TECHNICAL SUPERVISION, AND ASSISTANCE REGARDING THE OPERATION OF A SKID-MOUNTED MSF UNIT

R.D. GEIGER, Aqua Chem Incorporated, Waukesha, Wisconsin 53186

The project consists of evaluating the performance of a skid mounted self-contained multistage distillate pilot plant which is to operate on different kinds of feed water, such as seawater and highly polluted water such as rivers and bays containing raw sewage and algae. The unit is intended to determine the effect of polluted waters on such conditions as foaming, product water contamination, scale formation, rate of corrosion due to high gas content, and the ability to eliminate high gas content with conventional deaerating equipment.

The pilot plant is designed to stimulate performance under polluted water conditions of large scale MSF distillation plants up to and including 150,000 gallons per day. The plant is skid-mounted and adaptable to barge or rail car mountings to provide maximum transportability to various sites by common carriers. The weight, height, width, and length permit movement over rails to sites throughout the Continental United States. The plant is moved to the railroad siding nearest to the proposed test site and then skidded or hauled by low-bed trailers to the final site location. The unit is incorporated in two modules to enable it to be placed in operation in the shortest time.

3.0492, IRRIGATION REQUIREMENTS FOR WYOMING

R.D. BURMAN, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

1. Estimate growing season evapotranspiration for principal crops for each major weather station in Wyoming. 2. Estimate the number of irrigations required, the total amount of irrigation water required, and the dates of irrigations based upon evapotranspiration estimates, historic rainfall data and soil moisture retention characteristics of major soil types. 3. Determine probabilities of seasonal rainfall, numbers of irrigations required, dates of irrigation, and total water required for each weather station.

1. Evapotranspiration for each station will be estimated by commonly accepted methods, which have been compared with results from the nearest field studies. 2. A soil moisture balance will be maintained for each location, crop and soil. When the soil moisture level reaches a minimum an irrigation will be credited to the season. Any excess rainfall moisture over field capacity will be considered to be waste. 3. Results from Objective 2 will be portrayed as empirical probabilities. The results will be organized

and published as an experiment station bulletin for use by engineers, irrigation equipment dealers and farmers.

SUPPORTED BY Wyoming State Government

3.0493, HIGH ALTITUDE EVAPOTRANSPIRATION FROM NATIVE MEADOWS

R.D. BURMAN, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

1. To design and calibrate a lysimeter to directly measure evapotranspiration from native hay on an hourly basis.

2. To measure evapotranspiration from native hay under oasis conditions.

3. To measure and analyze evapotranspiration from Russian wildrye, intermediate wheatgrass and mixtures of the grasses with alfalfa.

1. Three alternate designs of lysimeters will be evaluated at the Agronomy Farm in Laramie by comparing evapotranspiration measured by the lysimeters with measurements made by microclimate measurements and the Energy Balance theory.

2. A long, narrow site along preferably the Platte River near Elk Mountain will be selected for lysimeter installation before the second summer season. Insight into the small scale oasis effect will be possibly from noting the variation in evapotranspiration across a field and the large-scale effect may be deduced by theoretical analysis or a comparison between results obtained at Laramie in native meadows in larger irrigated areas.

3. Evapotranspiration will be measured by neutron soil moisture probes on a split plot design having alfalfa or no alfalfa as the main plot effect and the superimposition of Russian wildrye and intermediate wheatgrass as the split plot effect.

SUPPORTED BY Wyoming State Government

3.0494, STUDIES IN SOILS AND AGRONOMIC PRACTICES - SHOSHONE PROJECT, WYOMING

L.I. PAINTER, Univ. of Wyoming, School of Agriculture, Laramie, Wyoming 82071

A study of the management factors necessary to improve the productivity of the Christianberg soil series, a saline soil with a poor production record in the Shoshone Irrigation Project area of the Bighorn Basin, Wyoming. Determination of the effects of gypsum and manure on physical properties of the soil at seedbed levels, and on crop yields and quality, is being observed. Adequate levels of nitrogen, phosphorous, and potassium are being maintained. The study plots are located on the experiment station. Crops grown will include sugar beets, corn, small grains, and alfalfa.

3.0495, IMPROVEMENT OF WATER YIELDS AND SOIL STABILIZATION IN RIVER BASINS

R.D. TABLER, Univ. of Wyoming, School of Agriculture, Laramie, Wyoming 82071

Object: To provide information required to manage related forest and range lands of the Big Horn, Powder River, and North Platte drainages for more sustained summer water supplies and minimum erosion and sedimentation.

Plan of Work: The project staff is continuing to investigate the effect of sagebrush removal on water yield. At present, the effect is determined by soil moisture measurements, but treatment will also be applied to a gaged watershed after calibration. They are also studying the effect of sagebrush removal on snow disposition. On lodgepole pine forests, they are determining the effect of stand density on soil moisture and water use.

SUPPORTED BY U.S. Dept. of Agriculture

3.0496, CONTROLLING PHREATOPHYTES

UNDESIRABLE

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: To determine for phreatophyte control (1) the best herbicides and application methods, (2) the effect of various cli-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

matic, soil and plant factors on response to herbicides, (3) the value of new chemicals, and (4) the value of different combinations of chemicals, burning and mowing or other mechanical treatments; and to develop suitable methods for long range control of undesirable phreatophytes.

Plan of work: Herbicides will be applied as foliage sprays by aerial or ground equipment, as basal and cut stump treatments, and as soil treatments to evaluate their effectiveness on individual species of phreatophytes. Treatments will be made at various rates, dates, and locations to correlate plant responses with conditions for growth, stage of growth, soil characteristics, competing vegetation, etc. Various burning, mowing and other control methods alone and combined with chemical treatments will be compared. New chemicals will be evaluated for effectiveness on salt cedar and other phreatophytes in greenhouse and outdoor nursery trials. All herbicides, surfactants and other chemicals that show promise will be further evaluated in field trials.

Control of Water on The Land; Groundwater Management; Effects of Man-Related Activities on Water; Watershed Protection.

4.0001, WRAGG SWAMP CANAL INVESTIGATION, ALABAMA

J.F. MCCAIN, U.S. Dept. of Interior, Water Resources Division, Tuscaloosa, Alabama

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Alabama.

Purpose - To determine relationships between peak rates of runoff and rainfall intensity and duration. To verify channel capacities, gradients, roughness factors, and runoff coefficients. To investigate the effects of increasing urbanization in Mobile County on time of concentration and runoff coefficients.

Methods - Rainfall-streamflow records will be collected at two sites and high water information at eleven sites. A streambed profile will be prepared at least once each year to evaluate siltation and dredging operations. A high water profile will be obtained after each flood of approximately five year recurrence intervals. Aerial photos and maps will be used to evaluate changes in urbanization.

4.0002, PINK SALMON INVESTIGATIONS - FRESH-WATER ECOLOGY

W.J. MCNEIL, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Total freshwater mortality of pink salmon (*Oncorhynchus gorbuscha*) has been measured in Sashin Creek since 1940. For the average brood year, only 6 percent of the total eggs potentially available for deposition produce fry migrating to the estuary, but survival may vary between 0.2 and 23 percent. Other studies have revealed that mortality occurs mostly between the time of egg deposition and fry emergence.

One goal of research conducted at Little Port Walter is to identify the factors causing mortality in spawning beds, determining which are density dependent and which are nondensity dependent. Environmental factors including water flow and temperature, dissolved oxygen supply, and gravel composition and permeability are measured and related to mortality rates. Biological factors including density, temporal and spatial distribution, and size of spawning adults are also measured and related to mortality rate.

Another research goal is to develop a better understanding of the factors responsible for ecological change in spawning beds. In this regard, we are investigating rates of oxygen removal due to decomposing organic matter and the mechanics and kinetics of spawningbed siltation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

4.0003, EFFECTS OF WATERSHED MANIPULATION ON DEER AND ELK USE

D.J. NEFF, State Game & Fish Department, Phoenix, Arizona

Objective: To determine deer and elk use on watershed on which the vegetation is being manipulated to increase water yield.

Procedures: 1. Conduct one annual pellet group count on each of the 18 Beaver Creek pilot watersheds using the existing sampling systems. 2. Calculate deer and elk pellet group densities and test for significant differences among years and watersheds with reference to experimental treatments. 3. Locate consistent pellet group concentration areas within individual watersheds and utilize all available site characteristics data to identify the causes of such concentrations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Arizona State Government

4.0004, DEER FOODS ON WATERSHEDS TREATED FOR INCREASED WATER YIELD

D.J. NEFF, State Game & Fish Department, Phoenix, Arizona

Procedures: 1. Maintain at least two tame trained deer for field feeding trials. 2. Continue field feeding observations with tame deer on a wide variety of sites to test the palatability of as many plant species as possible. Supplement field feeding observations with pen feeding observations as appropriate. 3. Collect and analyze rumen samples from road killed and hunter killed deer in the pine and juniper types for comparison with forage preferences of the tame deer. 4. Record occurrence by species of grasses, forbs and browse plants during spring and summer on all pellet group plots before treatment. 5. Record forage plant species occurrence on pellet group plots after treatment, with timing of observations as indicated by development of post treatment plant communities. 6. Compile and analyze data and prepare completion reports. Prepare and present information at the frequent Beaver Creek show-me trips.

4.0005, METHODS FOR WATER QUALITY IMPROVEMENT AND ITS STORAGE UNDERGROUND

L.E. MYERS, U.S. Dept. of Agriculture, Phoenix, Arizona

Objective: To investigate the effectiveness of vegetation filtration, soil percolation, and underground storage for renovating secondary sewage effluent.

Plan of Work: Laboratory and field studies are conducted to study the flow process in a soil profile under intermittent inundation and to evaluate the quality improvement of the effluent and the optimum management of recharge basins. The possibilities for nitrate control in the final product by induced denitrification will be investigated. The laboratory studies involve soil columns with recording tensiometers, gamma ray densitometry, and computer applications. The field studies are carried out at a three-acre pilot recharge project now under construction west of Phoenix.

4.0006, WATER YIELD IMPROVEMENT FROM RIPARIAN AND UPLAND AREA OF RIVER BASINS

J.S. HORTON, Arizona State University, U.S.D.A. Forest Service, Tempe, Arizona 85281

Object: To determine evapotranspiration losses from phreatophyte vegetation growing on moist and wet watershed areas in the Southwest; to develop management practices designed to reduce uneconomic or wasteful water use by floodplain and riparian vegetation; to determine ways to improve water yield and reduce erosion and sediment movement in chaparral, woodland, forest, and mountain grassland through management of plant cover.

Plan of work: In riparian areas, work will be continued on methods for and measurement of evapotranspiration losses from

4. WATER QUANTITY MANAGEMENT AND CONTROL

phreatophyte species and possible replacement vegetation; determination of effect of submergence of tamarisk; taxonomy and successional studies of phreatophyte species. In chaparral areas work will be continued on water and sediment yield from small watersheds as affected by wildfire, brush regrowth following fire, and suppression of woody growth by chemical sprays. In woodland areas the effect of size of plant, soil moisture, and climatic factors on water use by juniper will be determined. In pine-fir areas water use and sediment yield as affected by timber management will be studied, as will be the yield of upper tributaries of Salt River as influenced by snow accumulation and melt.

4.0007, CLIMATE, SOIL AND VEGETATION INFLUENCES ON HYDROLOGY OF RANGELANDS IN THE SOUTHWEST

R.B. HICKOK, U.S. Dept. of Agriculture, Tucson, Arizona

Objective: Methods of predicting influences of microclimate, soils, vegetative cover, and cultural practices on flood runoff and the net yields of water and sediment from semiarid watersheds.

Plan of Work: Determine influences of soil and vegetation differences and cultural practices on the soil moisture regime, runoff generation and sediment production at the rain-site; on runoff abstractions and their disposition; and on sediment transport, overland and in watershed channel systems.

SUPPORTED BY U.S. Dept. of Agriculture

4.0008, FLOOD WAVE MOVEMENT IN NATURAL EPHEMERAL STREAM CHANNELS

R.B. HICKOK, U.S. Dept. of Agriculture, Tucson, Arizona

Objective: Determine cause and nature of impulse waves generated by runoff resulting from cloudburst type thunderstorms; predict flood wave crest heights and travel velocities.

Plan of Work: Relate measured crest heights and velocities of travel of impulse waves to location and nature of storms causing the runoff, to preceding flow conditions, debris in transport, and hydraulic parameters of the channels.

SUPPORTED BY U.S. Dept. of Agriculture

4.0009, STREAM FLOW REGIMES OF SEMIARID RANGELAND WATERSHEDS IN THE SOUTHWEST

R.B. HICKOK, U.S. Dept. of Agriculture, Tucson, Arizona

Objective: Determine relations of stream flows to storm patterns, runoff source-area characteristics, and hydraulics of the stream channel system, and derive improved equations for predicting the flow regimes of complex watersheds.

Plan of Work: Categorize storm patterns according to runoff producing potentials and relate to frequencies of occurrence for particular localities, determine runoff response characteristics of varying land types and conditions as affected by topography, geology, soils, vegetation, and cultural practices, and determine runoff transmission characteristics on varying stream channel systems. Determine how runoff generation and down-slope runoff abstraction processes are affected by varying rainfall parameters, depending on land conditions, and the manner in which resulting runoff inputs to major channels are modified by hydraulics of the channel system to affect their outflow hydrographs.

4.0010, TRACE AND TRACER ELEMENTS IN GROUND WATER

G.R. DUTT, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

The concentration of Sr, Co, Cd, Pb, Zn, Cu, Ni, Cr, Mn, Fe, Li, SiO₂, B, K, NO₃, F, CO₃, HCO₃, SO₄, Cl, Na, Mg and Ca were measured in groundwater and in effluents from municipal treatment plants, industry and agriculture. The concentration of the above elements varied greatly throughout the state of Arizona. Concentrations higher than recommended by the Public Health Service were found for several of the wells studied. The composition of water from treatment plants varied greatly from

water supplies. When these effluents were recharged the concentrations of metals in the percolating water was not a function of these concentrations in the influent.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Arizona

4.0011, CONTROL OF UNDESIRABLE SHRUBS AND REVEGETATION OF SOUTHERN ARIZONA RANGES

J.H. EHRENREICH, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

The major objective of this study is to determine the effectiveness of various techniques for increasing forage production on desert shrub areas. This is to be done by: (1) Evaluating the effectiveness of brush control methods, both cultural and chemical, on creosotebush, honey mesquite, and tarbush. (2) Evaluating techniques and equipment for seeding and establishing desirable forage species in conjunction with brush control. (3) Determining forage species that can best be seeded and established under prevailing climatic and edaphic conditions. (4) Determine physiological and cultural requirements necessary to establish adapted species.

A number of mechanical and chemical brush control treatments are applied in combinations with different seeding methods on plots of various sizes. Two vegetative communities--mesquite and creosotebush--are used. The treatments will be replicated, and results analyzed statistically. Laboratory and field tests of moisture and temperature factors affecting germination of grass species will be made.

A variety of grass species are to be tested for adaptability on treated areas. Small plots will be used and treatments replicated.

Gravimetric soil moisture determinations will be made at various dates of seeding and during growing season.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0012, SEEDING ARID RANGELANDS OF ARIZONA

J.H. EHRENREICH, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Experimental work will be done at two widely separated areas in northern and southeastern Arizona. The main objectives of the project are: (1) To evaluate seedbed preparation and methods of seeding in order to effectively revegetate range types under study. (2) To evaluate both chemical and mechanical methods of shrub control. (3) To select those forage species which are best adapted to the particular range type. (4) To determine, by the use of appropriate instrumentation, the microenvironmental conditions limiting the germination, growth and establishment of grass seedlings.

Various combinations of seedbed preparations, brush control treatments, and seeding techniques will be used on replicated, randomized, one-half acre plots. Results will be statistically analyzed.

On the plot area, ants will be controlled with Mirex bait, and rabbits and rodents with appropriate poison baits applied in cooperation with the Bureau of Sport Fisheries and Wildlife.

Vegetation data collected will include species composition, frequency, and density. Permanent photo plots will be established to indicate ground cover changes. Soil moisture will be measured by means of gypsum blocks, and precipitation and atmospheric humidity will be obtained from recording rain gauges and hygrothermographs. A variety of grass species will be tested for adaptability on the different sites.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0013, INFILTRATION CAPACITIES UNDER VARIOUS VEGETATION TYPES AS INFLUENCED BY WATERSHED MANAGEMENT PRACTICES

M.J. ZWOLINSKI, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

The objective of this study will be to determine the infiltration capacities of various soils under different vegetation types and conditions and to relate this information to overall watershed performance. Other objectives will be to examine infiltration

4. WATER QUANTITY MANAGEMENT AND CONTROL

curves and determine if non-wettability factors exist to change the shape of these curves.

A sampling scheme is being designed whereby infiltration measurements are taken on areas most representative of a particular vegetation type and watershed condition. Infiltration measurements will be made principally with a modified North Fork sprinkling infiltrometer equipped with a constant head tank. Field data will be analyzed by computer and infiltration curves will be obtained from an incremental digital plotter. The study will obtain infiltration data which can be used to make meaningful comparisons between various vegetation types and watershed practices.

Arizona State Government

4.0014, MORTALITY RATES AND RECRUITMENT

H.E. BRYANT, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

From fish samples taken annually by gill nets and rotenone, growth rate studies will be conducted for selected major species in Bull Shoals and Beaver Reservoirs. Scale samples will be utilized to identify age-groups and all collections will be analyzed to determine year-class composition, recruitment and mortality estimates. In addition, sex ratios, length-weight relationships and condition indices will be computed for all major species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

4.0015, COOPERATIVE AGREEMENT FOR BEAVER RESERVOIR CREEL CENSUS STUDY

T.O. DUNCAN, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

Plan of Work: To study angler's catch, effort, and related factors during impoundment of Beaver Reservoir. A cooperative program.

Objective: To estimate: (1) sport fishing harvest as numbers and pounds of fish by species per acre for each season of the census year; (2) fishing success in numbers and pounds by species per angler-hour; and (3) total harvest and effort.

Procedure: Estimates of fishing pressure to be obtained by the progressive count method using observations from aerial flights and from boats. Fishing success estimated by fisherman interviews. Harvest estimates based on information obtained from fisherman's catch. Traffic data counts will be used in comparison of boat and aerial counts.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

4.0016, DESIGN AND CONSTRUCTION OF GEAR FOR MIDWATER TRAWLING

A. HOUSER, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

The utility of midwater trawls for sampling fish populations in reservoirs has been demonstrated in previous work units. The technique has been shown to be highly efficient for capturing young shad. Exploratory fishing in other lakes and in capturing studies in Bull Shoals and Beaver reservoirs have demonstrated that other species can also be captured in sufficient numbers to provide population estimates. The efficiency of the method can be greatly improved with improved designs for the various gear components, such as nets, otterboards, depressors, hydrofoils, winches, etc. Each component will be evaluated, redesigned, constructed and tested as continued use reveals that a need exists.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

4.0017, ESTIMATES OF COMPOSITION, ABUNDANCE AND FLUCTUATION IN FISH POPULATIONS IN BULL SHOALS AND BEAVER RESERVOIRS

A. HOUSER, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

Knowledge of species composition, estimates of abundance, recruitment, growth and mortality is required in interpreting the population dynamics of fish populations in these two reservoirs.

The necessary data must be obtained from fish samples which will be taken annually. Scale samples, measurements of length, weight and sex will be taken from fish obtained in gill net and rotenone samples. Relative abundance estimates will be derived from these samples. In addition, electrofishing will be used for further sampling to derive estimates of abundance. Through samples taken by these methods, changes in populations of adult fish will be defined.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

4.0018, SEDIMENTATION AND IN-PLACE FILTRATION DURING FLOW THROUGH EARTH FRACTURES

R.E. BABCOCK, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

This work consists of a combined theoretical-experimental study of sedimentation during the flow of fluid particle slurries through earth fractures. The experimental program is designed to measure steady-state sedimentation variables. The analogy between other rate processes is stressed. In-place filtration through the walls of the fracture is being studied using a 'dynamic' filter press. An AD-80 analog computer is being used to solve the mathematical model describing the process. The results will apply primarily to the disposal of granular waste. This project was initiated FY67 and its anticipated completion date is FY69.

4.0021, CHEMICAL AND MINERALOGICAL RELATIONSHIPS BETWEEN SUBMERGED SOILS AND RICE CULTURE

G.A. PLACE, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

4. WATER QUANTITY MANAGEMENT AND CONTROL

Objectives: 1. To investigate the physical, physico-chemical, and chemical characteristics of submerged soils. 2. To determine the effect of changes in soil chemical, biological, physical, and mineralogical properties on uptake of nutrient elements. (To be carried out in cooperation with Project 650, University of Arkansas.) 3. To learn what happens to the applied and soil phosphorus, potassium, and minor elements under submerged conditions when the weed population is controlled. 4. To study the effect of placement and time of application of the above elements upon rice yields. 5. To determine the accumulation effects of salts contained in the irrigation water upon the physical and chemical properties of the rice soils. (To be carried out in cooperation with Projects 397, and 443, University of Arkansas.) Work Proposed: Laboratory and greenhouse experiments will be conducted with appropriate field plot design being used to support the fundamental hypotheses. An attempt will be made to identify the major soil types used for growing rice and then characterize them physically, chemically, and mineralogically. Laboratory and greenhouse experiments will be conducted on these soils to determine the physical, physico-chemical, and chemical changes that occur under submerged conditions. With studies of this type investigators should be able to more accurately predict the response of fertilizer applications.

4.0022, COOPERATIVE WATERSHED MANAGEMENT IN SNOWLANDS AND LOWER CONIFER ZONES OF CALIFORNIA

W.E. STEINER, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Berkeley, California

The Forest and Range Experiment Station is performing research for the Department of Water Resources on a matching fund basis in the snowlands and commercial conifer zones of California for the ultimate purpose of discovering best watershed management practices on such lands.

This year, the physics of snow hydrology and snowmelt will be studied, and temperatures and moisture of soils before, under, and after the snowpack. Measurements of soil moisture and climate will continue on lower conifer zone plots with varying degrees of vegetation removal, and intensive measurement will be made around single trees isolated last year by tree and brush removal.

SUPPORTED BY California State Government

4.0023, FEEDBACK CONTROL OF CANAL CHECK GATES

J.A. HARDER, Univ. of California, School of Engineering, Berkeley, California 94720

Increased multipurpose use and variable demands on canals has resulted in making water conveyance to meet delivery requirements increasingly difficult by manual operation. A satisfactory method of automatically adjusting check gates in response to water demands would improve control and might produce savings in operational costs. For a particular canal reach, a lowering of the water level would be compensated for by opening the gate at the upstream end. Conversely, a rise would result in a closure of the upstream gate and, if the downstream reach is not full, to a opening of the downstream gate. This control underscores the need for considering the effects of hydraulic transients on the function and stability of automatic features.

This project will develop a numerical solution with the aid of a digital computer that will give response to any combination of boundary conditions for a canal reach between checks and include adjustable parameters to describe the characteristics of feedback control of canal checks. The computer program will be used to search for the optimum value of the parameters to be built into the prototype controller that will control water levels and flow automatically with minimum supervision by ditchriders. An examination will be made of the reaction of an entire canal system with automatic downstream control equipment through the use of the digital computer program. Also a comparative study shall be made to determine the effectiveness of various proportional and two position ('on-off') controllers and combinations thereof on the response of the canal system. The project was started in FY 1966 and should be completed in FY 1968.

4.0024, ECONOMIC EVALUATION OF PRIMARY BENEFITS FROM FISHING AND HUNTING BASED ON THE NATIONAL SURVEYS OF FISHING AND HUNTING

S.V. WANTRUP, Univ. of California, Water Resources Center, Berkeley, California 94720

The primary objective is to appraise and analyze the data collected in the National Survey of Fishing and Hunting with a view to improving the projections of demand for five fishing and hunting activities. The principal determinants of participation in these sports will be elicited from the information available to improve regional demand formulations.

SUPPORTED BY University of California

4.0025, EVALUATION OF GROUNDWATER RESOURCES, LIVERMORE VALLEY, CALIFORNIA

P.A. WITHERSPOON, Univ. of California, School of Engineering, Berkeley, California 94720

A predicted rapid increase in the population of Livermore Valley, California over the next few decades points to the need for a master plan of water management. The main objective of this investigation is to provide quantitative data on the hydrologic characteristics of the groundwater basin of this valley that can be used in formulating this plan. An improved mathematical model has recently been developed at the University of California and will be the principal analytical tool.

A three year program of investigation is proposed. The first year will be spent in collecting basic hydrologic data. The geology has recently been worked out by the California Department of Water Resources. The second year will be spent in setting up two-dimensional and three-dimensional models of the basin. With this approach, it will be possible to investigate: (1) subsurface rates and directions of flow, (2) effectiveness of existing hydrologic barriers (vertical and horizontal), and (3) effect on subsurface flow patterns of current and future rates of recharge and discharge. The third year will be devoted to an analysis of the probable impact on subsurface hydrologic conditions over the basin of anticipated rates of water withdrawal and waste water disposal.

4.0026, DRAINAGE SYSTEMS FOR THE IMPERIAL VALLEY

L. WILLARDSON, U.S. Dept. of Agriculture, Brawley, California

Objective: Develop and evaluate surface and subsurface drainage systems and provide criteria and specifications for their design, efficiency, durability, installation, maintenance, and rehabilitation.

Plan of Work: With models, analogs, and digital computers develop theoretical and rational equations that describe movement of water in the soil toward drains. Develop, test, and evaluate tools and techniques to acquire data on physical and chemical phenomenon associated with drainage. Design and test prototype drainage systems under field conditions, including drain tube materials, filters, vertical and horizontal alignment, and installation and maintenance techniques.

Cooperation: Agricultural Experiment Stations, SCS, U. S. Bureau of Reclamation, State Engineers, State Water Resources Agencies, and other irrigation, water management, or soil conservation district agencies.

4.0027, THE PROCESSES AND CONDITIONS CONTRIBUTING TO THE ACCUMULATION OF NUTRIENTS IN DRAINAGE WATER FROM IRRIGATED AREA AND SOIL RECLAMATION

L.D. DONEEN, Univ. of California, School of Agriculture, Davis, California 95616

The process and conditions contributing to the accumulation of nutrients and other salts from irrigated lands, and the reclamation of salty and high boron soils, as a water pollution study. The

4. WATER QUANTITY MANAGEMENT AND CONTROL

relations between the quantity of water required to leach high nitrate and boron soil profiles and the effect of these constituents on the subsurface drains and deeply percolating waters.

Laboratory investigations include sorption, desorption and movement of boron in laboratory studies in conjunction with field work. These results are being applied to computer programming to estimate the quantity of leaching water required. The removal of high nitrates from these soils is also being studied.

Field investigations include the reclamation of soils high in boron, nitrate and salinity by progressively leaching the soil in eight prepared basins and a study of the conditions of the natural subsoil profile in relation to the production of crops and the efficient or drainage water from the leached soils.

SUPPORTED BY University of California

4.0028, SOIL SOLUTION DISTRIBUTIONS AND CROP RESPONSES RELATED TO IRRIGATION PRACTICES

R.J. MILLER, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: (1) Study the distribution and movement of nutrient elements and other salts in the crop root zone in relation to different irrigation practices; (2) Determine the optimum distribution of nutrient salts with relation to plants at different stages of growth and development; (3) Study crop yield responses on salt affected soils in relation to controlled fertilization and water management; (4) Study the mechanisms involved in transfer of salts and water through soil and subsequent uptake by crop plants.

Description: (1) Improve techniques to study the transfer of salts in the soil profile under different water management practices; (2) Through plant analyses, root, soil moisture, and salt distribution studies, determine optimum nutrient distribution in soil at particular stages of plant growth; (3) Based on new sampling techniques and current knowledge of salt and water movement in soils, determine fertilization requirements of crops grown on salt affects soils; (4) Correlate changes in salt concentration and soil-water content with nutrient uptake by crop plants during growth and development. Root distribution, and chemical analyses of plant material and soil solution will be utilized in these studies.

4.0029, PREDICTIONS OF WATER REQUIREMENTS OF CROPS FROM MICROCLIMATIC PARAMETERS

W.O. PRUITT, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives and work proposed: 1. Determine evapotranspiration (ET) for a number of crops at various stages of growth and maturity including a crop of tall fescue as an indication of potential ET. 2. Compare above with predicted potential ET based on various empirical, semi empirical and theoretical methods for hourly or longer periods. 3. Determine the energy balance on a diurnal and seasonal basis. 4. In cooperation with Dept. of Agricultural Engineering personnel, study eddy transfer mechanisms for heat, moisture and momentum under both advection and non-advection conditions. 5. Study the influence on ET of several plant-soil-atmosphere conditions. ET for alfalfa tomatoes and sugar beets will be measured using the neutron moisture meter. A new 6' x 8' hydraulic lysimeter will also be used in the sugar beets in 1964 and in other crops later. ET for grass will be determined hourly using the two 40' lysimeters.

To accomplish objectives 2-5, a near-continuous measure of net radiation, soil heat flux, and evaporative heat flux will be obtained. In addition profiles of air temperature, humidity and wind speed as well as the flux of convective heat and momentum, will be determined for 1/2-hour periods under various climatic conditions during a number of days of the year.

SUPPORTED BY California State Government

4.0030, MOISTURE REQUIREMENTS OF DECIDUOUS ORCHARDS

K. URIU, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: This project was started to study the relation of soil moisture to the growth and production of fruit trees. (1) Study of the effect of irrigation on the end and side cracking of the prune. (2) Study of the effect of different soil moisture tensions in the upper ranges of available moisture on the vegetative and fruit growth of cling peaches.

4.0031, WATER RESERVOIR SYSTEMS

J.J. KALVINSKAS, North Amer. Rockwell Corp., El Segundo, California

POUNDERS

A program is proposed to investigate a reservoir system network in an urban area to alleviate problems of storm water runoff, eliminate costly and cumbersome sewer networks for storm drainage, and simultaneously provide for rainfall conservation. The study would be accomplished by conducting a systematic analysis of water runoff in an urban area, evaluating the location of a multiplicity of reservoirs throughout the area, and investigating both surface and subterranean reservoirs for rainfall storage.

4.0032, NUTRIENT REMOVAL FROM AGRICULTURAL WASTE WATERS

L.A. BECK, State Dept. of Water Resources, Fresno, California 93723

Drainage facilities are being constructed in the San Joaquin Valley to remove perched brackish ground waters from the Valley. These drainage facilities are planned to discharge into San Francisco Bay. Nutrients in the drainage waters may cause algal growths in the Bay.

Studies are being conducted near Firebaugh, California, to develop a practical biological treatment method for nutrient removal and by use of pilot plant facilities determine the efficiency and design criteria and costs of construction, operation, and maintenance.

The methods under investigation are anaerobic bacteriological denitrification in deep ponds and packed columns, algae growth and harvesting in shallow ponds, and desalination.

4.0033, GROUND WATER RECHARGE AND MANAGEMENT IN CALIFORNIA

P. NIXON, U.S. Dept. of Agriculture, Fresno, California 93726

Objective: To develop and evaluate improved facilities, methods, principles, and design criteria required for efficiently recharging underground water reservoirs.

Plan of Work: Continue study of water movement through soil down to the water table as it relates to storage rates, buildup and dissipation of ground water mounds, impeding layers within the profile, clogging by turbid water at the soil surface and permeability changes due to the interaction of salts in the percolating water and the exchange complex of soil layers. Quality of ground water resulting from recharge by both natural and artificial means will be studied. Work will be carried on in field plots and infiltrometers as well as in the laboratory.

SUPPORTED BY U.S. Dept. of Agriculture

4.0034, FLOOD AND SEDIMENT REDUCTION IN STEEP UNSTABLE BRUSHLANDS OF THE SOUTHWEST

R.M. RICE, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Glendora, California

Object: To evaluate flood peaks and debris production in relation to meteorologic, geologic, edaphic and vegetative conditions, and to develop and evaluate land treatments for controlling erosion and floods, particularly following fire in steep, unstable brushlands.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Plan of Work: The project staff is investing two overall problems: flood hydrology and erosion control measures. In flood hydrology, the studies include (1) inventories of hydrologic conditions in southern California; (2) investigation of variables pertinent to floods and erosion; and (3) hydrologic analyses of data from stable chaparral watersheds. The erosion control measures being evaluated are (1) wetting agents for reduction of post-fire erosion; (2) durable land treatments installed prior to and after a large fire; and (3) side slope erosion rates.

SUPPORTED BY U.S. Dept. of Agriculture

4.0035, ANALYSIS OF WATER CHEMISTRY

A.W. FAST, State Dept. of Fish & Game, *Los Angeles, California*

Objectives: To determine the effects of artificial destratification on the basic chemical and physical limnology of the lake by comparing observed changes in the lake with records of chemical and physical data collected during our investigations.

Procedure: Water samples will be collected from three depth intervals at one station monthly for complete chemical analysis. Water samples will be collected at 1- and 2-meter intervals, 2 to 4 times monthly, to determine dissolved oxygen, total alkalinity, turbidity, pH, and conductivity. Water samples will be collected at 2-meter intervals, 3 or 4 times yearly, to determine concentrations of phosphorus, manganese, and iron. Water samples will be collected at 2-meter intervals monthly to determine chlorine demand. Mud samples will be collected at 2-meter intervals monthly to determine chlorine demand. Mud samples will be collected from five depths, 3 or 4 times yearly, to determine complete oxygen demand and total nitrogen. Three mud samples will be collected from each 2-meter depth interval at three locations yearly to determine particle size and organic vs. inorganic fractions. Temperatures will be measured with a resistance thermometer from each 0.5-meter depth from these locations weekly. All water samples will be collected using standard techniques and equipment. Mud samples will be collected with an Ekman dredge or a small coring device. Chemical records compiled by the City of San Diego and Helix Irrigation District will be used to draw a base line for comparing observed changes due to destratification. Records will also serve as criteria for evaluating change caused by water volume fluctuations. Comparisons will be made between the pre-aeration and aeration period.

Electronic data processing programs are being written to analyze the data.

4.0036, COOPERATIVE WATERSHED MANAGEMENT ON BRUSSLANDS OF CALIFORNIA

W.E. STEINER, Univ. of California, Water Resources Center, *Los Angeles - U.C.L.A., California 90024*

The University, from its Davis campus, on a matching fund basis, does research for the Department of Water Resources for the ultimate purpose of discovering best watershed management practices on typical brushlands of the State.

This year, evaluation of past experimental conversion of brushland to grassland, and of the effect of conversion on water yield, time distribution, and quality, will continue. Continued data collection is expected to confirm and further refine relationships discovered in the past between rainfall, rainfall patterns, and runoff, and between storm rainfall and surface and subsurface components of flow during and after storm periods. Prediction equations and graphs, and their necessary parameters will be further developed. Economic analyses of costs and benefits will continue, and possibly preliminary figures published. Studies will continue of the rates and sources of sediment, particularly where increased sediment production appears to be a corollary of increased water yield, and alleviation measures will be tried.

SUPPORTED BY California State Government
University of California

4.0037, SAN GORGONIO PASS GROUND-WATER STUDIES, CALIFORNIA

R.M. BLOYD, U.S. Dept. of Interior, Water Resources Division, *Menlo Park, California*

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with State and local agencies in California.

Purpose: To determine the geologic and ground-water hydrologic features, feasibility of artificial recharge, and storage of water in the ground-water basins or storage units within the San Gorgonio Pass Water Agency area.

Methods: Available ground-water levels, well logs, well depths and yields, specific capacities, pumpage figures, chemical analysis, streamflow measurements, data on streamflow, and evaporation data will be collected. The pattern of ground-water movement will be shown by water-level contour maps. Gravity and magnetometer surveys will be made to assist in determining the location of ground-water barriers. These surveys may be supplemented by seismic surveys to define ground-water barriers, the extent of the ground-water basins, the thickness of the aquifers and the basin profile at the San Gorgonio River narrows.

California State Government

4.0038, FLOOD FLOWS AND SEDIMENT YIELD OF COLMA CREEK BASIN, CALIFORNIA

G. PORTERFIELD, U.S. Dept. of Interior, Water Resources Division, *Menlo Park, California*

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with State and local agencies in California.

Purpose: To determine the water and sediment yield of Colma Creek basin and evaluate the effect of current urbanization on the future yield of the basin.

Methods: Data will be obtained at two locations in the basin on a continuous basis and periodic observations of sediment and water discharge will be made at various other locations in the basin. These locations were selected on the basis of drainage area, and of the current and potential development in each area. The first location, that of the present gage on Colma Creek, is located downstream of the major urbanization and construction projects. The second location, that of Spruce Branch, is located downstream of an area where urbanization and basis erosion controls are nearly complete. Data thus obtained by standard procedures will be correlated with the various geologic, hydrologic, and physical factors influencing runoff and erosion.

4.0039, FLOODS FROM SMALL DRAINAGE AREAS

W.E. STEINER, U.S. Dept. of Interior, Water Resources Division, *Menlo Park, California*

The U. S. Geological Survey conducts this cooperative program, also contributed to by the U. S. Forest Service and the California Division of Highways, to determine flood magnitude and frequency data from representative small (10 square miles or less) drainage basins in California. About 270 crest stage gages have been installed on statistically representative small drainage basins. Thirty continuous recorders are moved from basin to basin, as correlations are established, so that eventually there will be sufficient data to define the magnitude and frequency of these floods on a regional basis for the entire State.

4.0040, TOLERANCE AND PHYSIOLOGICAL REACTIONS OF PLANTS TO SALINITY AND RELATED FACTORS

C.A. BOWER, U.S. Dept. of Agriculture, *Riverside, California*

4. WATER QUANTITY MANAGEMENT AND CONTROL

Objective: Determine the salt, specific ion, and exchangeable sodium tolerances of economic plants and the underlying physiological and biochemical mechanisms of growth inhibition by these factors.

Plan of Work: Use greenhouse cultures, outdoor sand tanks, and field plots to grow crops and ornamental plants under controlled salinity conditions, to determine tolerance to total salinity, specific ions, and exchangeable sodium as related to mineral nutrition, climatic factors, and foliar absorption of salt. Analyze experimental plants for salt accumulation and investigate mechanisms of salt absorption and translocation. Determine water status and water use by salt affected plants in relation to salt tolerance. Determine change in metabolic rates and pathways in salt-affected plants, and salt effects on content and properties of enzymes. Investigate methods for improving salt tolerance of crops by correcting chemical lesions, applying protective chemicals, modifying growing conditions, and selecting more tolerant varieties.

SUPPORTED BY U.S. Dept. of Agriculture

4.0041, LEACHING REQUIREMENT AND SALINITY STUDIES WITH BEARING ORANGE TREES

F.T. BINGHAM, Univ. of California, School of Agriculture, Riverside, California 92502

Bearing orange trees are being irrigated with salinized waters to observe the effects of soil salinity on fruit production. The objective is to develop appropriate irrigation management procedures for waters differing in salinity and alkali hazards.

The experiment consists of 4-tree plots, replicated 5-fold for each of the four irrigation waters. Irrigation is by basin flooding, applications being timed according to soil suction with treatments being initiated July 1965. Soil salinity levels are followed continuously. Plant tissue analysis, soil, analysis, and various soil physical properties will be related to tree performance, including fruit production characteristics.

SUPPORTED BY University of California

4.0042, CURRENT FISH AND WILDLIFE PESTICIDE PROBLEMS

E.G. HUNT, State Dept. of Fish & Game, Sacramento, California

Objectives: To evaluate those fish and wildlife pesticide problems and relationships that are currently of greatest concern to the Department. Concern is based on potential hazard to wild animals of certain experimental programs. The investigations are aimed primarily at (1) developing information regarding the hazard of these chemicals under field conditions, and (2) developing a guide for establishing adequate safeguards for fish and wildlife. Special attention will be given to the hazards to game and nongame species created by the use of mercurial seed dressings, aerial application of 1080 treated rodent baits and Endrin treated conifer and brush seeds, organic phosphates in cotton culture, and polychlorinated biphenyls (PCB) in eggs of raptors and water-associated birds.

Procedures: (a) Evaluate the hazard of mercurial seed dressings to birds. A survey will be made to determine the amounts of the different mercurials being used in California. Caged pheasants will be fed grain treated with alkyl mercury and another type of mercury fungicide to determine the effect on the test animals and the amount and type of mercury accumulated in tissues. Pheasants will be collected in areas where alkyl mercury and other mercury seed dressings have been used extensively over a period of years. The birds will be examined for gross pathology and tissues analyzed for mercury content. (b) Evaluate the effects on nontarget wildlife of the aerial application of 1080 grain baits, Diphacin, and Endrin treated conifer and brush seeds in both field and forest rodent control programs. (c) Field evaluations will be made regarding the effects on game and nongame wildlife resulting from the application of insecticides in cotton fields. (e) Eggs of raptors and water-associated birds will be collected and analyzed for polychlorinated biphenyls.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
California State Government

4.0043, HYDROLOGIC ANALYSIS OF GROUNDWATER BASINS BY DIGITAL COMPUTER SIMULATION

C.F. MEYER, General Electric Company, Santa Barbara, California

This project has a dual purpose: (1) to improve certain of the techniques used in devising a mathematical model of a groundwater basin, and (2) to provide technical assistance and consultation to other investigators, who are conducting separate but related research.

Mathematical techniques will be developed to permit water-elevation and other historical records to be used to deduce the effective values of storage factor, S, and transmissibility, T, in an aquifer. These techniques will be incorporated into a sample computer program, provided by the California Department of Water Resources, by means of which groundwater flow in an aquifer can be simulated and water levels computed. An evaluation will be made of the sensitivity of the techniques for deducing S and T to possible inaccuracies in estimating water production and recharge.

Technical support and consultation from the TEMPO staff and its consultant, David K. Todd, will make available the results of this work and other experience to the High Plains Underground Water Conservation District and to Texas Technological College, of Lubbock, Texas, who will investigate the application of mathematical modeling and computer simulation to the Ogallala aquifer and its management.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

4.0044, ROCK CREEK PARK CLARIFICATION PROJECT

H.F. SCHAEFER, Dow Chemical Company, Walnut Creek, California 94598

The objective of this project is to demonstrate the feasibility of and determine operating costs for in-stream treatment with polyelectrolytes for the removal of suspended solids and other contaminants.

A site will be selected on upper Rock Creek within the District of Columbia. Polyelectrolyte solutions will be sprayed into the stream at a rate proportional to the streamflow rate. The coagulated solids will settle a certain distance downstream in a temporary settling basin created by an inflatable dam. Water leaving the basin will be chlorinated for further disinfection.

Various parametric studies will be conducted, including investigation of different polyelectrolyte types, different dosing rates, and sludge recycle.

4.0045, LITERATURE REVIEW ON FLOODED GREEN TIMBER AREAS

R.E. CHANDLER, Canadian Wildlife Service, Ottawa - Ontario, Canada

To review the existing literature on flooded green timber areas to assess their possible value to waterfowl in Ontario and to suggest possible methods for the management of such areas for maximum waterfowl utilization. These methods will be implemented in management plans for any such areas acquired in Ontario.

SUPPORTED BY Canadian Government

4.0046, MARSH EVALUATION AND ACQUISITION - ONTARIO

D.G. DENNIS, Canadian Wildlife Service, Ottawa - Ontario, Canada

To provide a three stage report on the quality waterfowl areas throughout Southern Ontario, directed towards the maintenance and development of suitable waterfowl habitat. The primary phase will be a preliminary list of wetland units showing location, acreages, descriptions, cost estimates and on acquisition

4. WATER QUANTITY MANAGEMENT AND CONTROL

priority rating. The second phase will be submitting acquisition proposals for each area. Following acquisition, an ecological study and management plan will be prepared for each unit. This project was begun in 1967 and will continue for an undetermined period.

SUPPORTED BY Canadian Government

4.0047, STUDY OF THE DISTRIBUTION OF FOUR ASSOCIATIONS OF AQUATIC PLANTS IN THE VICINITY OF MONTREAL

J. LAMOUREUX, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To study the relationship of four associations of aquatic plants, namely Scirpetum, Sagittarietum, Typhaetum and Pontederietum, with depth of water. To assess their general relative position on a transect line running from pasture to water. To compare data obtained in different kinds of marshes, i.e., islands (6), bays (2), bog lakes (1). To describe the distribution of these associations in the vicinity of Montreal.

SUPPORTED BY Canadian Government

4.0048, AN ECOLOGICAL STUDY OF ILES-DE-LA-PAIX, LAKE ST. LOUIS, QUEBEC

M. LAPERLE, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To study the ecological relationships between the habitat and waterfowl using a group of alluvial islands in Lake St. Louis, Quebec. This study will be conducted over a period of two years and has begun in April 1968.

SUPPORTED BY Canadian Government

4.0049, MARSH EVALUATION AND ACQUISITION, QUEBEC

M. LAPERLE, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To provide a three-phase report on quality wetland areas in the province of Quebec, directed toward maintenance and development of adequate waterfowl habitat. The initial phase consisted of a preliminary list of wetlands showing their location, acreage, description, cost estimates and an acquisition priority rating. A separate acquisition proposal is then made for each area. Following acquisition, an ecological study and management plan will be prepared for each unit. This project was begun in 1966 and will continue on an undetermined period.

SUPPORTED BY Canadian Government

4.0050, AN ECOLOGICAL STUDY OF LAKE ST. PETER, QUEBEC

W.T. MUNRO, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To study the relationships between water level aquatic plants and insects, and duck production on Lake St. Peter, Quebec. This study, with the emphasis to be placed on the black duck, was begun in April, 1968.

SUPPORTED BY Canadian Government

4.0051, WATERFOWL HABITAT INVESTIGATIONS - OTTAWA RIVER

W.T. MUNRO, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To study the effects of flooding on waterfowl habitat on the Ottawa River. The water level of the Ottawa River at the study area near Thurso, Quebec, was raised after a hydro-electric dam was erected at Carillon, in 1963. Vegetation and waterfowl breeding surveys were to be carried out before, during, and after the flooding of the river to determine the relationship between the pre-flood and post-flood vegetation complex and waterfowl use.

SUPPORTED BY Canadian Government

4.0052, MARSH EVALUATION AND ACQUISITION - MARITIMES

A.D. SMITH, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To provide a three phase report on quality wetland areas throughout the Maritimes, directed toward maintenance and development of adequate waterfowl habitat. The initial phase will be a preliminary list of marsh units showing location, acreages, descriptions, cost estimates and an acquisition priority rating. According to priorities acquisition proposals will then be submitted for each area. Following acquisition, an ecological study and management plan will be prepared for each unit.

SUPPORTED BY Canadian Government

4.0053, REHABILITATION, SCOTSBURN MARSH, NOVA SCOTIA, CANADA

G.H. WATSON, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To design a waterholding structure for this marsh. To experiment with waterlevels in order to obtain optimum habitat conditions for waterfowl and furbearers. To encourage growth of desirable aquatic plants through waterlevel fluctuation; plowing, discing, and fertilizing. To increase the quality of habitat through construction of nesting islands, and excavating of areas which cannot be adequately flooded.

This project involves land acquisition, and therefore the starting date is uncertain. It is hoped that it will commence in 1968, and that certain investigations will continue for an indefinite period.

SUPPORTED BY Canadian Government

4.0054, MUSQUODOBOIT - METERING BASINS NOVA SCOTIA, CANADA

G.H. WATSON, Canadian Wildlife Service, *Ottawa - Ontario, Canada*

To evaluate the ecological effect of change in the water levels and related causes in small lakes, bogs, and marshes in the Musquodoboit watershed. The first stage, observation of vegetation before water-retaining structures are built, is to take place in September 1967. Each following year a vegetation survey is to be made. In addition, use by wildlife will be observed. It is hoped to carry out experiments with fluctuating water levels to reach an optimum stage of aquatic vegetation for waterfowl and furbearers.

SUPPORTED BY Canadian Government

4.0055, IMPROVEMENT OF HIGH ALTITUDE (7600) VEGETABLE CROPS

F.D. MOORE, Colorado State University, Agricultural Experiment Sta., *Center, Colorado*

1. Determine nutritional requirements of San Luis Valley vegetable crops as related to irrigation practices with regard to an increase in crop yield and quality. 2. Relate environmental phenomena peculiar to high altitude growing area to production of vegetable crops. 3. To test vegetable crop varieties, strains, and breeding lines for their commercial production value in the San Luis Valley. 4. To test chemical herbicides and determine correct rates for their use on vegetable crops grown in the San Luis Valley. 5. To determine irrigation practices which will best conserve water with no limitation to vegetable crop production. 6. To retard senescence of highly perishable vegetables.

A major portion of the study will involve the determination of the optimum fertilization of head lettuce with regard to irrigation practices. Soil and tissue analyses will be made as well as measurements on yield and quality after vacuum pre-cooling and the transit and marketing period. Effect of solar UV radiation and high intensity solar radiation (in the visible range) on vegetable crops will be studied. Varieties will be evaluated with regard to market preference, San Luis Valley growing conditions, and quality during the transit and marketing period. Rates and

4. WATER QUANTITY MANAGEMENT AND CONTROL

methods of application of standard herbicides as well as experimental chemicals will be tested. An attempt will be made to prolong the marketable condition of head lettuce and cauliflower through the use of anti-senescence compounds. Enzyme and respiration studies will be used to supplement information gained from the senescence and radiation studies.

SUPPORTED BY Colorado State Government

4.0056, WATER APPLICATION AND USE ON A RANGE WATERSPREADER

F.A. BRANSON, U.S. Dept. of Interior, Water Resources Division, *Denver, Colorado*

The objective of this project is to determine quantities and frequency of flows onto the spreader and the quantities of water stored and lost from the soil during the growing season. To determine changes in vegetation and soils due to waterspreading.

The spreader site was precalibrated in terms of kinds and quantities of plants present for three years before the waterspreader was constructed. One year of soil moisture records on the spreader and control areas were obtained before water was applied to the spreader.

Water applied to the spreader is measured by means of a water stage recorder which determines the duration of flow through a pipe onto the spreader and by means of a rain gate. Use of water on the spreader is determined by means of periodic soil moisture samplings.

Plant measurements are being made by the Montana Agricultural Experiment station. The measurements include line transects and yield determinations. Twelve species were seeded on the spreader to test adaptability.

Soil samples for physical and chemical measurements were taken before water spreading and will be obtained again during the final year of study.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

4.0057, RADIOISOTOPE WATER FLOW MEASUREMENT IN HIGH-HEAD TURBINES AND PUMPS

R.L. HANSEN, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225 (AT(49-11)2758)*

Radioisotope methods and instrumented systems developed by the Denver Office, Bureau of Reclamation, Department of the Interior, for open channel water flow measurements are adaptable in part to the problem of accurately determining the rate of water flow through high-head turbines and pumps - a measurement which cannot be as accurately made by conventional methods. Research is being conducted to determine the minimum mixing length required to obtain adequate mixing. Techniques and equipment for injection of radioisotopes are being developed. A program of field testing is being

SUPPORTED BY U.S. Atomic Energy Commission

4.0058, RESEARCH AND BASIC DATA ON THERMAL POLLUTION

G.E. HARBECK, U.S. Dept. of Interior, Geological Survey, *Denver, Colorado*

This work, initiated in FY'69, involves research into some of the theoretical aspects of heat transfer and dissipation when heated water is discharged to rivers. Of primary interest will be the relationships among the eddy-transfer coefficients, or diffusivities, of heat, momentum, and water vapor when the atmospheric lapse rate is non adiabatic.

In addition to the research, certain basic data will be collected and published that will be immediately helpful to both plant designers and researchers. The data would include flow, measurements of temperature profiles, and velocity distribution under controlled conditions on 10 to 12 streams representing a wide range of flow conditions and a variety of climatic and weather conditions. In addition, various pertinent meteorological parameters would be measured; air temperature, humidity, and wind speed.

SUPPORTED BY U.S. Atomic Energy Commission

4.0059, GROUNDWATER ANALYSIS BY DIGITAL COMPUTER APPLICATION DEVELOPMENT

H.R. MCDONALD, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

This study will develop procedures for the analysis of groundwater aquifer systems covering areas up to 25,000 square miles by use of digital computer applications. Present methods, using electric analogs are satisfactory for areas up to 2,500 square miles but become unmanageable for areas of larger magnitude. Extensive areal study of declining water tables, forecasting aquifer depletions, and relating this source of water supply to potential Reclamation project demands are primary objectives of this new research activity.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

4.0060, SURFACE WATER MANAGEMENT

R.E. DANIELSON, Colorado State University, Natural Resources Center, *Fort Collins, Colorado 80521*

The objectives of this research are: 1. to study the relative importance of various range conditions in Alpine areas to soil movement and water contamination; 2. to examine the dichotomy between flood hydrographs from 'forested' and 'agricultural' watersheds; 3. to develop soil treatments and systems of land preparation that will promote maximum use by the crop of rain where it falls, in marginal regions; and 4. to study the role of seepage and the mechanics of bank development in alluvial channels and its significance in the design of conveyance systems and control of rivers.

4.0064, DRAINAGE FACILITIES, METHODS, AND DESIGN CRITERIA FOR PROTECTION AND IMPROVEMENT OF AGRICULTURAL CROPS AND SOILS IN THE NORTHERN PLAINS

H.R. HAISE, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To develop theoretical and rational equations describing flow of water to surface and subsurface drains utilizing laboratory and field approaches for the development and evaluation of new methods and facilities for improvement and protection of agricultural crops and soils and the disposal or reuse of drainage water.

Plan of Work: Cooperative investigations will be conducted in the laboratory and field. Field evaluations of newly developed systems and practices will be made at specific sites under exacting engineering controls. The evaluation of new facilities for drainage will be made in various regions involving different soil and climatic conditions. New methods of drainage will be developed for special problem areas. Basic drainage formulas for computing drain spacing and depth of drains developed in the laboratory will be evaluated in the field for accuracy and suitability for use by drainage engineers. Data obtained from this project will provide additional design criteria based on recent developments in drainage techniques that have been evaluated in field studies.

4.0067, GROUND WATER RESOURCES

D.K. SUNADA, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Objectives: A) Analyze and develop techniques for efficient development and management of ground water aquifers. B) Evaluate the feasibility and usefulness of such techniques in maximizing the use of Colorado's water resources. C) Investigate the applicability of management and development techniques deemed feasible to the various ground water situations in Colorado and other areas. D) Train young engineers and scientists in the latest advancements for analysis and management of ground water resources through the graduate research program. E) Serve as advisors to the Colorado Ground Water Commission, Colorado Water Conservation Board, State Engineers Office, and other State and local water agencies on ground water problems.

Work Proposed: Refinement of modeling techniques which have been developed recently will be pursued and will include considerations for water quality. The measurement of water levels in the observation well network will provide the necessary data

for construction and verification of particular models as well as provide information now needed prior to management decisions.

4.0068, INFLUENCE OF ACCUMULATED SEDIMENTS UPON WATER VELOCITY OF MICROHABITATS OCCUPIED BY TROUTS

R.E. VINCENT, Colorado State University, State Coop. Fishery Unit, Fort Collins, Colorado 80521

Water velocities will be recorded near the bottom and sides of a stream. After severe turbidity and settling of bottom sediments, water velocities will be taken in the same cross section. The difference between the before and after water velocities can be paired with the velocity requirements of salmonids to give an indication of the influence of sediments upon microhabitats of trout.

The work will be conducted upon the upper Dolores and Rio Grande Rivers in southern Colorado.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Colorado State University

4.0069, INFLUENCE OF SEDIMENTATION UPON THE PRODUCTION OF GAME FISHES

R.E. VINCENT, Colorado State University, State Coop. Fishery Unit, Fort Collins, Colorado 80521

A pre-treatment population inventory was made of all species of fishes in Blue Water Creek in 1963. Sections of the watershed were then treated to reduce the amount of sediment in the watershed. Post treatment inventory will then be made of all fish species with emphasis upon species composition, numbers and age class, standing crop and productivity. Fish population information can be correlated with the changes in sediment discharge and attendant changes in water temperatures, food organisms, etc.

The project is being conducted in Blue Water Creek in south-central Montana.

Colorado State University

4.0070, COVER AS A LIMITING FACTOR IN TROUT PRODUCTION

R.E. VINCENT, Colorado State University, State Coop. Fishery Unit, Fort Collins, Colorado 80521

A one mile section of study stream was surveyed and divided into 100 ft sections of a general, uniform type. Measurements that determined the uniformity were mean current velocity, velocity distribution, total cover, amount of cover, and water depth. Fish population is being censused in each section by electrofishing so that number and weight of fish present can be related to the physical features of the stream. Fish cover will be manipulated to demonstrate further the effects of cover and population density.

Project is being conducted on Dale Creek, northern Colorado.

4.0071, STORM RUNOFF AND FLOODS AS RELATED TO INTEGRATED CLIMATIC AND WATERSHED CHARACTERISTICS

D.A. WOOLHISER, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To identify and integrate climatic and watershed factors influencing storm flows and floods from watersheds; develop procedures to estimate such flows from ungaged watersheds; to develop working tools to synthesize flood hydrographs, and methods to estimate the effects of changed use and conservation treatment of land on such flows; to study precipitation characteristics; methods to estimate the effects of pervious stream chan-

4. WATER QUANTITY MANAGEMENT AND CONTROL

nels and valley alluviums and combining or joining hydrographs of storm runoff and flow from small to increasingly large watersheds as flood waves travel downstream.

Plan of Work: The work is currently in progress on agricultural watersheds in the vicinity of Hastings, Nebraska; Newell and Cottonwood, South Dakota; and Ft. Collins Colorado. Some of the factors required for the analysis and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of the watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

4.0072, FACTORS INFLUENCING THE STABILITY AND REGIME OF CHANNELS IN AGRICULTURAL WATERSHEDS

D.A. WOOLHISER, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Object: To establish fundamental principles and develop planning and design criteria on (1) stability of natural and artificial channels; (2) influence of altered flow and sediment regime on channel deformation; (3) deposition patterns above sediment detention and water storage structures; and (4) geomorphic influences in waterway physiography.

Plan of Work: Laboratory and field studies will be made of (a) numerous channels with measurement or identification of all factors contributing to the existing conditions; (b) effect of imposing water and sediment control on the natural regime; (c) topographic maps, aerial photographs, and historic records of channel shapes, geometries, and waterway systems, and (d) coordination of laboratory and field investigations. Factors to be measured or identified include channel shapes and meander, hydraulic characteristics, water and sediment conveyance, vegetation aspects, physical and chemical characteristics of channel periphery materials, rates of aggradation and degradation, geomorphic parameters, climatic events and land use influences. New and improved instrumentation and techniques to measure and identify channel stability features will be developed. Findings will be analyzed and interpreted to provide information necessary to establish guides and criteria for planning, design, and maintenance of agricultural watershed programs.

SUPPORTED BY U.S. Dept. of Agriculture

4.0073, MATHEMATICAL MODELING OF SMALL WATERSHED FLOODS

V. YAVJEVICH, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The objective is the characterization of the response of small watersheds to rainfall in terms of mathematical relations among the physical parameters of the watershed. These relations will then be used to predict the runoff hydrographs for floods from small watershed.

Work will include: (1) Statistical correlation of watershed parameters with runoff; (2) Investigation of models developed from concepts of physical processes at work in runoff; (3) Coordination with a related project involving a one-acre experimental facility for rainfall-runoff experiments. Data from natural flood events will be added to the existing Small Watershed Data File.

SUPPORTED BY Colorado State Government

4.0074, MANAGEMENT OF FOREST GAME RANGES IN THE CENTRAL ROCKY MOUNTAINS, AND IMPROVEMENT OF FISH HABITAT BY MANIPULATION OF STREAMSIDE VEGETATION

D.R. SMITH, U.S. Dept. of Agriculture, Rocky Mtn. For. & Rg. Ex. Sta., Fort Collins, Colorado

Object: To determine (1) what constitutes high-quality habitat for important game species and desirable streamside vegetation for trout waters; (2) how habitat and streamside vegetation is modified by other land uses and range and

watershed improvement practices, and (3) methods of habitat improvement for the particular vegetation types and physiography of the region.

Plan of Work: Studies will be made of (1) environmental characteristics in terms of soil, elevation, aspect, vegetation type, etc.; effects of fire, logging, and livestock grazing; quantity, quality, and use of plants present; and of the current status of streamside vegetation and effects of land use; (2) the effect, on wildlife habitat values of chemical and mechanical plant control used for range improvement; and effects of phytocides and mechanical treatments in terms of physical and chemical changes of plants affecting habitat quality for particular game species; (3) the possible use of soil and plant amendments to improve nutritional quality and palatability of abundant low-quality species, to improve composition of the vegetation, and to attract game animals from deteriorated ranges; and (4) ecology of browse species with first attention on true mountain mahogany. Range, site, reproduction, longevity, and production and palatability of the forage will be determined.

4.0075, POTENTIAL FISHERY FOR RIVER HERRINGS IN CONNECTICUT RIVER

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

During 1966, basic information will be gathered on the time and duration of the run of each species of *Alosa* (with the exception of *Alosa sapidissima*) which enters the Connecticut River. Physical data will be gathered and temperature will be constantly monitored near the mouth of the river. The entering adults will be sampled with gill nets and lengths, weights and sex will be recorded. Scale samples will be taken for age determination. This sampling will continue periodically during the entire run. The techniques worked out and the basic data gathered at this time will be used to plan a more intensive study to be conducted in 1967 and 1968.

A survey will be made to ascertain the major spawning areas of each species. This area will be sampled with gill nets, seines and plankton nets to determine the species present and if spawning has occurred. Physical and chemical data will also be collected at this time.

This preliminary survey augmented by information gathered on the other sub-projects shown enable us to design an intensive survey which will be carried out in 1967 and 1969.

The laboratory facilities of the University of Connecticut, Marine Research Laboratory will be utilized for this sub-project.

4.0076, RESEARCH AND TRAINING PROGRAM DEALING WITH THE PROBLEMS AND POTENTIALITIES OF THE FOUR MAJOR RESERVOIR PROJECTS CURRENTLY UNDER WAY IN AFRICA

G.F. WHITE, Natl. Academy of Sciences, Washington, District of Columbia

The great artificial lakes being created by dams--Nasser in the United Arab Republic, Kariba on the borders of Zambia and Rhodesia, Kainji in Nigeria, and Volta in Ghana -- will eventually cover a combined surface of more than 7,000 square miles, bringing changes which will radically affect the economy and culture of the regions. At the outset, more than 250,000 people will have to be resettled to permit flooding of the areas; subsequently the introduction of hydroelectric power, the elaboration of irrigation and fisheries projects, and the development of transportation can be expected to transform the physical environment and alter the mode of life of whole populations.

SUPPORTED BY Rockefeller Foundation

4.0077, ECONOMIC ANALYSIS OF WATER USE IN IRRIGATION IN THE NORTHERN PLAINS

G.A. PAVELIS, U.S. Dept. of Agriculture, Washington, District of Columbia

Objectives: To analyze crop response to irrigation water under alternative managerial practices and soil conditions.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Approach: The analysis will be confined to small grains, legumes, sugar beets and potatoes, the crops best suited for irrigation in North Dakota. The managerial practices will be selected to include different levels of fertilization and alternative systems of farming and other managerial inputs consistent with irrigation farming. Primary data will be collected from irrigation farmers and the North Dakota State University Branch Irrigation Station. Additional data relevant to this study will be obtained from research planned by the Soils Department, North Dakota State University to measure response to irrigation water as affected by timing and amount of water per application.

SUPPORTED BY U.S. Dept. of Agriculture

4.0078, EFFECTS OF HEATED WATER IN A TIDAL ESTUARY

R.L. CORY, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

The Patuxent River is one of the few rivers entering Chesapeake Bay that presently is more or less free from cultural influences. In the near future rapid change is expected to result from urbanization in the upper basin and operation of a large generating plant at Chalk Point, which will significantly alter the temperature of the water in that vicinity. At times the heated water released into the estuary will be equal to or greater than the fresh water inflow.

The objective of this project is to understand the effects of such release in the physical, chemical, and biological character of a tidal river by studying the yearly and seasonal attachment, rates of growth and mortality of attached organisms, and associated physical factors, including salinity. Interrelations between the environment and aquatic biota will be determined for the normal hydrologic condition and the heated condition over a period of about two years for each.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

4.0079, WATER TABLE CONTROL IN ORGANIC SOILS

F.H. THOMAS, Univ. of Florida, Agricultural Experiment Sta., Belle Glade, Florida

Objective: (1) To determine the effectiveness of lined and unlined mole drains as part of a water table control system for shallow organic soils and (2) To make preliminary evaluations of crop response to different water table depths in shallow organic soils.

Description: Three water tables will be maintained on 9 plots on Everglades peaty muck soil in a 3 x 3 Latin Square design. Sub plot treatments will consist of unmole (check), conventional moling and plastic-lined mole drains. Water stage recorders established in the center of each sub-plot and in the 3 ditches surrounding the main plots will give the relation of water levels in the ditches to water tables in the plots. Piezometer tubes installed at strategic locations will furnish data to characterize the slope of the water table. Effectiveness of mole treatments will be determined by their ability to maintain the desired water table. Crops will be planted with rows crossing all moling treatments.

4.0080, EVALUATION OF CONSUMPTIVE WATER USE, SOIL-WATER STORAGE, AND THE INTERRELATION OF THREE COMPONENTS OF THE WATER BUDGET

W.H. SPEIR, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Data is collected from evaporation pans, evapotranspirometers, and land tanks located at Plantation Field Laboratory and the Everglades Experiment Station. Rainfall, runoff, groundwater levels, standard pan evaporation, and artesian pressure data are collected from four experimental watersheds in south and central Florida Flatwoods ranging in size from 4,000 to 63,000 acres.

These data are analyzed and correlated in order to: determine the effect of plant density, water table level, and climatic factors on evapotranspiration and apply these findings to agricultural watersheds; evaluate open water evaporation and the effect of climatic conditions on these water losses; derive methods for computing changes in soil moisture and ground water storage on a

watershed basis; derive and test methods for estimating evapotranspiration from small agricultural watersheds; and, evaluate contribution of artesian and pumped irrigation to basin storage

SUPPORTED BY Florida State Government

4.0081, DESIGN, INSTALLATION, AND MAINTENANCE OF SURFACE AND SUBSURFACE DRAINAGE SYSTEMS WITH OR WITHOUT LANDFORMING AND CONDITIONING

J.R. CARREKER, U.S. Dept. of Agriculture, Athens, Georgia

Object: To improve surface drainage systems on farms which will permit high level crop production and more efficient use of modern farm machinery; to determine the factors which control design of surface water conveyance systems and develop ways to stabilize such facilities; and to study design features and the feasibility of using lower cost materials for subsurface drains; and develop methods of maintaining subsurface drainage systems in good condition.

Plan of Work: Drainage and water control system design will be related to soil properties and drainage needs. Drainage systems and related tillage management will be developed to provide necessary surface add profile and water control and permit effective use of modern farm machinery. Data will be obtained on the rate of water movement over, into, and through the soil, and on the other soil properties that affect the management of water. Study will be made of the effect of length and gradient of the row, and the rates and amount of runoff, together with data on row erosion, in order to reorganize drainage patterns in the sugar cane production areas, to improve drainage and workability of the land, and to increase the percentage of land in useful crops. The overall use of lower cost materials for drains will be tested. The need for and required design features for subsurface systems will be studied in the laboratory and field.

4.0082, THE ARTESIAN SYSTEM IN GEORGIA STRATIGRAPHY AND HYDROLOGY OF THE OCALA

R.E. CARVER, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The Ocala limestone is a principal source of water for the south Georgia region whose continued development depends upon the intelligent use of water supplies from this aquifer. The hydrologic and recharge characteristics of the Ocala are not well understood; hence the long range productivity of the reservoir cannot be predicted.

The major objectives of the research are to determine: (1) the lithology and distribution of the Ocala and correlative units, (2) the hydrologic and recharge characteristics of the Ocala and correlative units, and (3) the effects of long term use (last 50 years) on the piezometric surface.

Procedure: All known data regarding the geology, water and well records of the Ocala limestone aquifer will be compiled. In addition, palynological, petrological, lithostratigraphical and biostratigraphical studies of the Ocala limestone from well samples and also from the entire outcrop area within the state of Georgia will yield new data on the three dimensional stratigraphy of this aquifer in both the surface and the subsurface. This knowledge will lay the groundwork for further studies on ascertaining where and how the Ocala derives its recharge and where and how the water moves through the Ocala. These additional data will ultimately enable the pinpointing of sources of pollutants.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Georgia

4.0083, FACTORS AFFECTING WATER YIELDS FROM SMALL WATERSHEDS IN GEORGIA

C. COBB, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

Objective: To correlate rates and yields of runoff to watershed characteristics and climatic conditions.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Description: Watersheds representative of physiographic and climatic conditions will be selected and studied. Initially, two watersheds of approximately 100 and 1000 acres with representative Piedmont conditions near Watkinsville, Ga., will be studied. Each watershed will be characterized as to soils, geology, topography, land use, conservation practices, and management. Base flows, peak rates, and total yields of runoff will be measured. Precipitation will be measured. Precipitation and runoff characteristics will be interpreted in terms of causative factors including soil moisture properties, watershed characteristics, climatic conditions, and management. Punch card arrangement of data, computer programs, and statistical treatment will be coordinated with other contributing projects to Regional Project S-53.

4.0084, A SURVEY OF THE SEASONALLY-INUNDATED MARGINS OF LAKE VOLTA (GHANA)

P.M. AHN, Univ. of Ghana, Accra, Ghana

General - Assessment of the extent and quality of agricultural land seasonally flooded, location of promising agricultural areas, detailed soil survey and related investigations leading to their practical development; duration approximately two years commencing mid-1968.

Pre-field work: collection of background information; study of topography from maps and aerial photographs.

Reconnaissance: rapid reconnaissance of the area, by plane, boat and on foot, to allow preliminary classification of the lakeside areas as to priority for further, more detailed, investigation.

Detailed study: investigation of soils, topography, irrigation and drainage structures, social and economic factors (including transport and markets) affecting practical development.

The scheme involves close cooperation between the departments of Agronomy, Botany, Economics and Geography of the University, and also between the university personnel and the UNDP/FAO Volta Lake project. It is also hoped to involve up to 12 undergraduates of the University of Ghana in the field work in each of the two years of survey.

SUPPORTED BY Rockefeller Foundation

4.0085, FLOODS IN THE WAIHAOLE-WAIKANE AREA, OAHU, HAWAII

R. LEE, U.S. Dept. of Interior, Water Resources Division, Honolulu, Hawaii

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Hawaii.

Purpose: To provide flood data for use by State and county officials in planning zoning measures to protect Oahu residents from flood hazards.

Methods: Records of peak discharges from a regular gaging station on Waiahole Stream and from gaging stations of longer duration on nearby streams will be used to determine the magnitude-frequency relation of floods in Waiahole Valley. Field surveys of inundated areas from past floods will be made and transferred to an enlarged topographic map (scale 1:12,000) to delineate the inundated areas. The field survey will be guided by historical data and information obtained from long-time residents of the area.

4.0087, EROSION AND RUNOFF CONTROL PRACTICES AND SYSTEMS TO CONSERVE SOIL AND WATER RESOURCES IN THE PACIFIC NORTHWEST

M.E. JENSEN, U.S. Dept. of Agriculture, Kimberly, Idaho

Object: To develop improved erosion and runoff control practices and systems applicable to the climatic, soil, topographic, and cropping conditions of the Pacific Northwest.

Plan of Work: Studies are made of various crop sequences and management practices, as related to magnitude and severity of runoff and soil loss. Tillage systems, including stubble mulching, subsoiling, vertical mulching, minimum tillage, and deep profile modification methods are evaluated as to runoff and erosion control benefits. Other studies are concerned with adaptation and adjustment of farm equipment to better serve the needs of erosion control, and with practices to supplement natural resistance to wind and water erosion such as contour farming, row design, terracing, benching, and other methods with the view of developing adapted, effective and economical control measures. Studies are also made of engineering aspects of various types of terracing and benching systems, to collect excess runoff and deliver it from the field or to impound it for infiltration on leveled areas. Various types of terrace outlets and waterway designs are evaluated, including lining materials and permanent structures for managing the runoff water.

SUPPORTED BY U.S. Dept. of Agriculture

4.0088, FACTORS INFLUENCING THE FLOW OF SUB-SOIL WATER IN THE IMMEDIATE PROXIMITY OF AND INTO DRAINAGE FACILITIES

G.L. COREY, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

Object: To analyze and describe the sub-soil surface flow of water and those factors which effect it in the immediate vicinity of the drain facility for the preparation of improved criteria and procedures for design, installation and operation of drains.

Procedure: A drainage nomograph will be developed using the criteria of similtude developed under this project by the Colorado Station. Model soil columns will be allowed to drain under the influence of gravity. Scaled outflow will be plotted against scaled time for a wide range of homogeneous soil textures. Various column lengths will be used so that one can arrive at the drainage outflow-time relationship for any homogeneous soil material of any practical thickness.

4.0090, THE RELOCATION OF INDUSTRY AND THE LOCATION OF NEW INDUSTRY AS AFFECTED BY THE AVAILABILITY OF WATER SITES

A.E. PRELL, Southern Illinois University, Graduate School, Carbondale, Illinois 62903

The purpose is to investigate the reasons for the location of industry on the Mississippi River since 1945. The principal emphasis is to be on whether or not the availability of water played a role in the choice of the industrial site. Further, the study will investigate what types of industries find water sites essential and/or important enough to affect the location decision. Finally, the study will attempt to determine what barriers exist to the use of waterways and water sites for new industry on the Mississippi River.

SUPPORTED BY Southern Illinois University

4.0091, LAWRENCE AVENUE UNDERFLOW SYSTEM

M. PIKARSKY, Chicago Dept. of Public Works, Chicago, Illinois

The project is to construct a machine bored tunnel of 16,600 lineal feet of 12-foot tunnel and 9,300 lineal feet of 17-foot at a depth of 200-250 feet in the Niagaran limestone stratum for storage of excess combined sewage from a 3,620 acre urban area. Included are necessary inlet shafts, outlet shafts, vents, pumpage and new conventional trunk sewers.

The facility will eliminate approximately 48 - 52 yearly overflow events. The stored excess sewage will be pumped to an interceptor for treatment at the Northside Treatment Plant during low flow periods.

The proposed project will demonstrate the use and economics of utilizing large scale underground facilities for temporary storage of excess volumes of combined sewage produced during periods of rainfall. No City in the Nation is currently using such a system, which would have application in highly developed urban areas where space for surface storage is uneconomical.

4.0092, DOMESTIC WATER USE IN EAST AFRICA

G.F. WHITE, Univ. of Chicago, Graduate School, Chicago, Illinois 60637

An appraisal of volume of domestic water use, its monetary and other direct costs, its other social costs, and the factors affecting use and the choice among alternate sources. Use, social cost, and the decision-making process were examined in 31 sites in Kenya, Tanzania, and Uganda selected for diversity in environment. Both piped and unpiped sources were studied.

SUPPORTED BY Rockefeller Foundation

4.0093, FLOOD INUNDATION MAPPING, NORTHEASTERN ILLINOIS

A.W. NOEHRE, U.S. Dept. of Interior, Water Resources Division, Oak Park, Illinois

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Illinois and the Northeastern Illinois Planning Commission.

Purpose - To prepare inundation maps for the Northeastern Illinois Metropolitan area, covering 62 7 1/2-minute quadrangles.

Methods - Records will be obtained from an extensive crest-stage gage network, of which 69 sites will be rated for discharge in the 19 quadrangles remaining to be mapped. These records and previously established data collection points will be used to define flood profiles, inundation boundaries, and flood-frequency relationships. Inundation maps will be superimposed on topographic quadrangles and published as Hydrologic Atlases.

4.0094, ECOLOGY OF THE FISHES OF THE KASKASKIA RIVER

R.W. LARIMORE, State Dept. of Conserv., Springfield, Illinois

Objectives: Biologists of the Illinois Natural History Survey have studied the fishes of the Kaskaskia River during the past half century. Intensive investigations were carried out in 1928, again in 1960 and each year to the present. This long background of field work gives us information on the distribution of the fishes and an opportunity to evaluate changes that have occurred. Our field studies were intensified in 1965, at which time water was impounded in the new reservoir at Carlyle. A second impoundment is to be completed in 1969 at Shelbyville. The objectives now are (1) to continue getting the information on the habitat requirements and life history of river fishes, (2) to investigate the biology of reservoir fish populations, and (3) to determine the relationships between river and reservoir populations.

Procedures: Diurnal and seasonal changes in food habits of the more common fishes will be carried out and related to the benthic and drifting organisms. Reproduction of most of the species will be investigated both by examining individual fish and determining year class strength. From this we will understand what factors influence success of reproduction of sport fishes. Population changes and growth rates of various species will be followed by taking frequent collections, either seining or electrofishing, and by taking large late summer collections in the main river as well as in coves of the new reservoirs.

4.0095, TEMPERATURE PROSPECTING FOR SHALLOW GLACIAL AND ALLUVIAL AQUIFERS

K. CARTWRIGHT, State Geol. Survey, Urbana, Illinois

A thermistor probe for measuring shallow soil temperatures has been developed and is being tested as a means of prospecting for shallow sand and gravel aquifers. The theory is that shallow sand and gravel aquifers act as heat sources or sinks that produce temperature anomalies near the surface. Thermal surveys have been conducted over eight shallow sand and gravel aquifers known from test drilling and electrical earth resistivity surveying. A paper outlining the basic theory and citing a field example was published in Water Resources Research in April 1968.

SUPPORTED BY Illinois State Government

4.0096, GROUND-WATER GEOLOGY OF DEKALB AND BOONE COUNTIES, ILLINOIS

J.P. KEMPTON, State Geol. Survey, Urbana, Illinois

Collection of subsurface records, studies of physical characteristics, surficial mapping, air photo interpretation and geophysical surveys have provided a basis for interpreting the stratigraphy of the glacial deposits. Important sand and gravel aquifers with high ground-water potential have been delineated in the course of this work. Aquifers in the bedrock are sources of large ground-water supplies but their characteristics are less variable and have been better known than those of the glacial drift.

SUPPORTED BY Illinois State Government

4.0097, CLIMATOLOGY OF HAIL

S.A. CHANGNON, State Water Survey, Urbana, Illinois

Continuing investigations are being made of factors influencing hailstorms in Illinois. Recent studies include: correlation between areal distribution of hail in summer and distribution patterns of related climatological factors; climatological relations of hail days and thunderstorm days; detailed analyses and descriptions of hail cells in hailstorms from field surveys of severe storms; investigations of extensive, severe hailstorms in Illinois including antecedent weather conditions and extent of such storms to the west in Iowa and Missouri.

4. WATER QUANTITY MANAGEMENT AND CONTROL

New studies involve techniques to assess hail suppression programs. Included are radar-hail detection studies, hailage development, types of data for use in measuring suppression effects, and statistical design of projects.

4.0098, DEVELOPMENT OF COST CRITERIA FOR WATER SUPPLY

J.H. DAWES, State Water Survey, Urbana, Illinois

An effort is being made to develop cost data criteria to be applied in comparisons of alternative water resources developments. These criteria will be extracted from actual cost data collected from federal, state, municipal, and private agencies. The study encompasses impoundments, well supplies, and transmission facilities. Although the study is being made for Illinois, the purpose and format of its results should be of general interest.

Completed as of July 1968 were the following technical letters: No. 7, Water Transmission Costs; No. 8, Cost of Reservoirs in Illinois; No. 9, Cost of Pumping Water; No. 10, Costs of Wells and Pumps; and No. 11, Costs of Water Treatment in Illinois.

Cost studies are continuing for the development of working tools in our water resources development model that involves the capture, storage, treatment, distribution, reconditioning and recovery of water supplies.

4.0099, PIT METHOD OF ARTIFICIAL GROUND-WATER RECHARGE

R.L. EVANS, State Water Survey, Urbana, Illinois

A successful pit method of artificial recharge using Illinois River water was developed for heavily-used ground-water sources at Peoria; infiltration rates reached as high as 175 feet per day and water temperatures were maintained at desirable levels. Pits currently operated by city as needed and contribute substantially to maintaining the water table in that area. Research to evaluate effects of artificial recharge is continuing; includes observation for introduction of possible contaminants, and the effect of artificial recharge on clogging tendencies in the aquifer soils.

4.0100, EVAPORATION RETARDATION, PONDS OR SMALL LAKES

W.J. ROBERTS, State Water Survey, Urbana, Illinois

After earlier field studies on small lakes and farm ponds in Illinois which showed usefulness of monomolecular chemical film in retarding evaporation, research was aimed at efficient and economical method of application of film. Although the usefulness of monomolecular chemical films for retarding evaporation from water bodies has been proven in many world-wide tests, the cost of such a film cannot be justified except in special cases.

Tests carried on cooperatively with Southern Illinois University and the Procter and Gamble Company during 1967 and 1968 indicate that solid barriers in various forms can be used over large surfaces where wind is a big factor in impairing the efficiency of the chemical monolayer. While water savings using barriers becomes quite high, it is necessary to balance such savings with the oxygen demand of aquatic life under the barrier.

Solutions are being tested to determine the ratio of water area covered by solid barriers to peripheral areas covered by chemical films. The project involves economic studies to determine the life of plastic and other barriers, and their ability to withstand exposure to storms.

4.0101, TRACER STUDIES - URBAN RUNOFF

M.L. TERSTRIEP, State Water Survey, Urbana, Illinois

In conjunction with other urban runoff studies, a program has been initiated to use tracers in determining travel times during relatively high flows within a small urban watershed (Boneyard Creek in Champaign-Urbana, Illinois). To determine the travel time from a given point in the basin to the stream gage, a

fluorescent dye (Rhodamine B) is released at the point of interest, and the concentration measured downstream at the gage. The time lapse between the release and the peak concentration downstream is considered to be the travel time. Measurements are made during winter as well as warm-season rains.

4.0102, DEVELOPMENT OF A MATHEMATICAL MODEL FOR THE SIMULATION OF FLAT-LAND WATERSHED HYDRAULICS

H.P. JOHNSON, Iowa State University, School of Agriculture, Ames, Iowa 50010

The primary objectives of the proposed research project are: (1) to develop a mathematical model to simulate the flow of water from an area which is characterized by shallow surface depressions and artificial (man-made) drainage facilities, (2) to use the model to investigate the effect of the degree of drainage on watershed outlet flows and (3) to use the model to investigate the economics of agricultural drainage.

There are regions in our country where the flow of water from large areas is greatly facilitated by artificial drainage and where the drainage facilities are constantly being improved. The movement of water through and from these areas is not fully understood. A method or procedure should be developed which will provide a more complete knowledge of flat-land hydrology. A mathematical model will achieve this objective. Such a model will be of value to water resources planners and engineers. The mathematical model will be developed on a digital computer.

4.0103, FIELD INVESTIGATIONS OF SUBSURFACE AND SURFACE DRAINAGE

H.P. JOHNSON, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Objectives: 1. Determine effects of tile spacing and crop management on corn and soybean yields 2. Obtain drawdown and tile discharge data from present installations 3. Obtain hydraulic conductivity and pore space characteristics of soils which are drained 4. Determine design criteria for tile joints 5. Determine probability of drainage need based on climate, plant and soil characteristics

Description: 1. Yields of corn and beans will be obtained on Davis County and Clarion-Webster Experimental Farm where tile spacing and surface drainage experiments are installed 2. Drawdown, tile discharge and water table level data will be taken at Ankeny Station, private farm near Bloomfield, Davis Co. Farm, Ag. E.-Agron. Farm, Kanawha Farm, Howard Co. Farm and Carington-Clyde Farm 3. Field and lab. measurements of hydraulic conductivity and pore space characteristics of several soils in Ia. where drainage is a problem are planned 4. laboratory study of the hydraulics of flow at tile joints is planned to determine whether tile can be installed on steep grades 5. The determination of frequency of given water levels for given tile depth and spacing, soil properties and rainfall is planned.

4.0104, HYDROLOGIC CHARACTERIZATION OF SMALL WATERSHEDS

H.P. JOHNSON, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Objective: The objective of the project is to investigate the use of mathematical, electrical and hydraulic models to study hydrologic phenomena of watersheds.

Description of Work Proposed: The work will be conducted in two steps, namely, (1) develop parameters for quantitatively describing watersheds, and (2) quantitatively describe watersheds which have been gaged and relate parameters describing the watershed to surface runoff and, if possible water yield. For step 1 physiographic information such as contour maps, stream cross section, profiles and aerial photos of small watersheds in several

4. WATER QUANTITY MANAGEMENT AND CONTROL

physiographic areas will be collected. From these watersheds parameters as area and drainage density will be defined. The interdependence of variables will be determined. In step 2 gaged watersheds will be studied. All known flow characterizing variables as mean annual discharge, unit graph, rainfall, peak flows and low flows will be defined. The relationship of watershed parameters and flow characterizing parameters will be studied.

4.0105, IRRIGATION INVESTIGATION IN IOWA

H.P. JOHNSON, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

The research carried on under this project has covered the problems of the determination of the optimum levels of water application and soil and plant management needed for maximum returns from field crops. Associated with this work has been the study of moisture use by corn.

The results to date have identified the ranges of optimum conditions necessary for maximum production of corn under irrigated conditions in Iowa.

The experiments have been conducted in the field on both sandy and heavy soils. The data collected represent crop responses during years of varied climatological conditions.

SUPPORTED BY Iowa State Government

4.0106, TECHNOLOGY AND ECONOMICS OF CONSERVATION

P. ROSENBERRY, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Objectives: To determine and evaluate the economic aspects of current and developing technology of water management. This will include evaluating the effectiveness of alternative terrace systems and other land treatment measures in managing the flow of surface water to: 1. More effectively utilize precipitation to crop production through control of runoff; 2. reduce soil fertility losses from sheet erosion; 3. control gully growth; and 4. reduce downstream sediment and flood damages. Associated effects to be analyzed include the maintenance or improvement of soil productivity, pollution abatement, efficiency of machinery use and the land area removed from production as a result of the water management measures adopted.

Approach: The first step is a comparative cost study of alternative types of terraces applied in the North Central Region. The analyses considers slope, soils and methods of construction. The large, parallel, grassed-backslope terraces will receive particular attention. Following studies will evaluate the effectiveness of representative terrace systems and other measures in producing various on-site benefits.

SUPPORTED BY U.S. Dept. of Agriculture

4.0107, AN EVALUATION OF SOME MARSH MANAGEMENT TECHNIQUES

M.W. WELLER, Iowa State University, School of Agriculture, Ames, Iowa 50010

To evaluate the success of some common marsh management techniques, long-term studies of nesting waterfowl populations and vegetation are being conducted on three areas. On the Ruthven Game Management Area, an evaluation is being made of the waterfowl use of potholes made by blasting over 20 years ago. The longevity of the potholes and their influence on vegetation is being appraised. Their permanent vegetation and bird-use is being measured, and bird-use is being compared with that on natural water areas. On the Spring Run Game Management Area, a preliminary study was made of the nesting duck population, nest-site selection, and the relationship of nests to water areas and to cultivated fields. A portion of the study area is being grazed lightly to compare grazed versus ungrazed areas. Vegetative data also are being recorded to evaluate the impact of grazing on the density and species composition of upland herbs and grasses.

At the Elk Creek Marsh near Lake Mills, Iowa, a series of impoundments is being built to create three deep, permanent

marshes along a stream fringed with sedge meadows and seasonally inundated marshes. The development of vegetation and waterfowl populations is being recorded and water levels are being manipulated to produce maximal vegetation suitable for duck nesting and feeding as well as for hunter-use. Muskrat activities and populations also are being measured.

SUPPORTED BY Iowa State University
Iowa State Government

4.0108, EVALUATION OF HABITAT AND REPRODUCTIVE FACTORS WHICH INFLUENCE POPULATIONS OF NESTING WATERFOWL

M.W. WELLER, State Conservation Commission, Des Moines, Iowa

Objectives: To measure vegetation changes; develop techniques for reestablishment where plants have been eliminated by water levels and muskrats; evaluate waterfowl use of habitat and measure environmental relationships and reproductive behavior which influences waterfowl use; evaluate role of artificially created marshes; and to appraise grazing effects on waterfowl nesting.

Procedures: Elk Creek Marsh: Changes in vegetation will be recorded by transects data on units, will be re-run only during periods of dramatic changes. Cover maps, photographs and water depths will be recorded. Use of nesting cover will be studied. Dramatic increase will be made in water levels providing a means of measuring the value of flooded emergent vegetation in attracting potential nesting ducks in the spring. Growth of muskrat populations will be appraised by spring territory and mid-winter house counts.

Ruthven Area: Vegetation of key marsh areas will be cover mapped in spring and in winter. Waterfowl populations will be appraised. Populations of blue-winged teal will be nest trapped and marked for study. General observations on success and design of marsh draw-down experiments, artificial pot-holes and other habitat techniques.

Spring Run: Waterfowl populations will be appraised by spring- pair counts intensive nest-searching, and brood-counts. Vegetation in nine selected 5-acre quadrants will be measured by sampling marsh and upland portions of each. Species composition and density will be appraised. Newly fenced portion will be surveyed to appraise plant use and damage by cattle. One-half of marsh area will be grazed lightly and pair-use and nesting success will be related to grazing.

4.0109, REMOVAL OF SUSPENDED MATTER AND TURBIDITY FROM WATER BY FLOCCULATION WITH POLYELECTROLYTE COAGULANTS AND COAGULATION ACIDS

M. REBHUN, Technion, Haifa, Israel

Object: To determine the electrokinetic properties of suspended particles, principally clays of the montmorillonite, illite and kaolinite groups; the reactions occurring when suspended in saline waters and the flocculation effects of additive coagulant materials such as electrolytes, polymers and metallic compounds. The study will seek to develop knowledge needed to design field methods to remove suspended material from flood waters to be used for ground water recharge.

Plan of Work: Laboratory study will be made to determine settling characteristics of suspended matter in natural flood water and changes brought about by adding polyelectrolytes and other flocculants or flocculant aids. Electrochemical and other properties of the suspended material will be determined and changes noted as flocculants of known characteristics are added. This will include determination of changes in the zeta potential of the suspended materials. The retention of the suspended materials in waters of various salt concentrations and sodium-absorption ratios will be studied. The microscope electrophoresis will be used to measure the electrophoretic mobility of the particles. With information from these basic studies of characteristics and related mechanisms of reaction, field application studies will be developed and carried out.

4.0111, DRYLAND SOIL MANAGEMENT

W.W. HARRIS, Kansas State University, Agricultural Experiment Sta., *Colby, Kansas*

Objectives: Objectives of this project are broad. They are: (1) Maximum moisture conservation and utilization, (2) soil protection from wind and water erosion, and (3) optimum crop production.

Description of work proposed: A series of short and intermediate length experiments will be used so that changes in machinery and equipment can be included in overall testing. Evaluation of currently available equipment and its effect on the above-named objectives will be made. Moisture utilization and optimum crop production will be investigated in a series of date of planting, rate of planting, row width studies, and fertility tests. Weather records will be used in evaluating results.

SUPPORTED BY Kansas State Government

4.0112, MANAGEMENT OF SOILS IN DRYLAND REGIONS

C. THOMPSON, Kansas State University, Agricultural Experiment Sta., *Fort Hays, Kansas*

Concentration of runoff water from contributing area onto leveled or bench terrace areas to determine the feasibility of such a system of water conservation. A series of 9 runoff areas located on an approximate 2% slope and contributing runoff water to 6 leveled plots through 3 flumes for measurement purposes have been established. Rotation of fallow, wheat, sorghum is used on contributing area plots and a continuous cropping of grain sorghum is used on the leveled areas.

4.0113, SOIL MANAGEMENT UNDER DRYLAND CONDITIONS

D.L. ROBINSON, Kansas State University, Agricultural Experiment Sta., *Garden City, Kansas*

To determine the effect of tillage methods and other soil management techniques on yield and quality of crops, wind and water erosion, conservation of soil and water resources, and efficiency of water storage and utilization. Work includes (1) comparisons of various types of farming equipment for seedbed preparation, planting, and cultivation, (2) crop rotations, (3) use of fertilizers, (4) dates and rates of planting, and (5) tests with soil surfactants and other transpiration and evaporation reducing agents.

SUPPORTED BY Kansas State Government

4.0114, SOIL MANAGEMENT INVESTIGATIONS ON IRRIGATED LAND

R.J. SWENSON, Kansas State University, Agricultural Experiment Sta., *Garden City, Kansas*

The objectives are to study the problems of crop rotations, fertilizer requirements, methods of irrigation, water requirements, consumptive use of water, soil management methods, comparison of tillage implements, efficiency of water use, time and frequency of irrigation, rates of seeding, effects of fertilizer on quality, and the correlation of laboratory analyses of the soil with actual field response to fertilizer and other management practices.

A wide range of tests are conducted to gain the above objectives.

SUPPORTED BY Kansas State Government

4.0115, STORAGE OF FRESH WATER IN UNDERGROUND RESERVOIRS CONTAINING SALINE WATER

D.W. GREEN, Univ. of Kansas, School of Engineering, *Lawrence, Kansas* 66045

It is proposed to study the utilization of underground reservoirs, which contain salt water, as storage zones for fresh water. Fresh water would be directly injected into a formation through wells, the injected water displacing brine away from the wells and forming a zone of potable water.

In the initial work, the storage process will be mathematically modeled. The model will consist of differential equations which describe water flow in a porous medium. It is to be an analogue of the storage reservoir, including injection-production wells, reservoir boundaries, and salt-water and fresh-water zones. The movement of the fresh-water bank will be 'tracked' as it displaces the saline water and the degree of mixing of the two phases at the interface will be calculated. Guided by the results of the modeling, an economic analysis will be made.

Based on the calculations an experimental program will be designed in which such variables as water injectivity characteristics and displacement efficiencies are examined. Field tests will be conducted in which water is first injected into a formation and then produced, the water being analyzed at set production intervals. Analysis of the field tests will be a final factor in determining the feasibility of undertaking a full-scale storage program.

4.0116, RECHARGE OF GROUND WATER IN RIVER VALLEYS OF EASTERN AND CENTRAL KANSAS, AND THE HIGH PLAINS

H.V. BECK, Kansas State University, Agricultural Experiment Sta., *Manhattan, Kansas* 66504

Objectives: 1) To determine the amount of recharge that is taking place in river valleys and the High Plains. 2) To determine the magnitude of withdrawal from water in reservoirs above that amount that is recharged. 3) to determine the methods of increasing natural recharge. 4) To determine the feasibility of artificial recharge.

Procedure: River valleys in Central and Eastern Kansas where ground water surveys have been made would be inventoried to determine decline of water table. Information on precipitation, pumping, and other uses would be used to calculate the magnitude of natural recharge. Materials surveys would be made to determine the relation between magnitude of recharge and rate.

SUPPORTED BY Kansas State Government

4.0117, EFFECTS OF TUTTLE CREEK RESERVOIR ON GROUND WATER LEVELS BELOW THE DAM

H.V. BECK, Kansas State University, Agricultural Experiment Sta., *Manhattan, Kansas* 66504

Objectives: To determine 1) the change in water levels in wells below the dam since water was impounded, 2) the fluctuations of water levels in comparison to those in wells above the mouth of Blue River in Kansas River Valley, and 3) from the above, if the water in the reservoir does contribute to more stable water table conditions.

Procedure: A system of observation wells would be established in the Kansas and Blue River Valleys and periodically

4. WATER QUANTITY MANAGEMENT AND CONTROL

measured. The present levels would be compared with the water table map presented in a M.S. thesis in 1959. This comparison would indicate the magnitude of lowering of the water table in the past five years. Records of pumping this spring and summer, along with records of lake level should indicate the effect of the reservoir on the water table.

SUPPORTED BY Kansas State Government

4.0118, POLLUTION FROM ANIMAL FEEDLOTS

G.H. LARSON, Kansas State University, School of Engineering, Manhattan, Kansas 66504

State Health Department personnel have concluded that runoff from concentrated animal feeding areas is the source of a new and serious kind of stream pollution. High nitrate and nitrite content in ground waters also have been reported unofficially near concentrated animal feeding areas.

Two experimental feedlots have been constructed. Each is intended for beef animals. Management is typical of that followed by commercial beef cattle feedlots. One feedlot is paved. The other is paved only at the feedbunks and the waterer. Lots are equipped to simulate rainfall and to measure and sample runoff.

Rainfall intensities of 0.30 to 2.6 inches per hour have been simulated for durations up to three hours for the lower intensities. Runoff from both simulated and natural rainfall are collected. Runoff versus precipitation rates and time are recorded. Analyses of five general groups are made on runoff samples. They are: bacteriological, organic matter, nitrogen forms, suspended solids, and miscellaneous chemicals. Solid samples from the feedlot surface are collected in an effort to relate runoff quality to surface condition.

Studies under different conditions of management and of precipitation will continue. Hydrologic factors relating to detention, treatment, and release of polluted runoff will be investigated. Chemical, physical, and biological changes of the runoff during detention will be studied. Consideration will be given to means of control such as the possibility of filtering runoff through the soil profile and spreading detained runoff on agricultural land.

4.0121, SUBIRRIGATION

H.J. BRAUD, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

The study involves the development of subirrigation systems using small diameter polyethylene plastic pipe.

Objectives: 1. To develop prediction equations for rate of discharge from orifices in an elastic wall pipe. This will be studied from laboratory calibrations. 2. To study the effect of orifice type on root encroachment and sediment accumulation in subirrigation lines. Field studies are in progress. 3. To determine the effect of hydrostatic pressure on the water distribution pattern in several soil types. Subirrigation systems will be installed in several Louisiana soils. 4. To develop subirrigation methods for vegetable production. The performance of subirrigation systems for field and greenhouse use is being investigated.

SUPPORTED BY Louisiana State Government

4.0122, EFFECT OF FORMATION DIP ON THE MOVEMENT OF FRESH WATER STORED IN SALINE AQUIFERS

O.K. KIMBLER, Louisiana State University, School of Engineering, Baton Rouge, Louisiana 70803

A previous research project, 'Fresh Water Storage in Saline Aquifers', has indicated that under reasonably favorable conditions it would be technically feasible to employ saline aquifers as fresh water storage reservoirs. These results were limited, however, to horizontal aquifers. The proposed work would investigate the influence of aquifer dip on the configuration and migration of fresh water bubbles during injection, storage, and production. Large physical flow models (8 ft diameter) and mathematical models will be employed. These results will be incorporated into a computational technique which will be used for preliminary economic studies of possible field application of such storage techniques.

4.0126, BOTTOM FAUNA STUDIES

K.E. LANTZ, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. To identify, count, weigh and measure the volume of bottom organisms in the four lakes prior to and following water fluctuations. 2. To correlate changes in counts, weights, and volumes of bottom organisms with physical, chemical and biological changes which occur during water level fluctuations in the four lakes.

Procedure: A series of bottom samples will be taken monthly from the littoral and open water areas with a Petersen dredge during the three months prior to fluctuation and monthly for three months following fluctuation. The samples will be washed and screened and contents preserved in formalin for later identification, counting, weighing and measurement of volumes of various benthic groups.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Louisiana State Government

4.0127, AQUATIC VEGETATION STUDIES

K.E. LANTZ, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. To map and identify the submerged plants in the four lakes. 2. To measure the dry weight of submerged vegetation in the lakes prior to and following periods of water level fluctuation. 3. To measure the nutrient levels of the submerged vegetation prior to and following water level fluctuation.

Procedure: Aerial and field observation will be used to identify and map the submerged vegetation in each lake. A series of vegetation samples will be taken prior to and following water fluctuation to measure dry weight of vegetation produced. This data will assist in detecting increases or decreases in vegetation as a result of fluctuation.

A series of vegetation samples will also be collected prior to and following fluctuation to measure nutrient levels of the submerged plants. Measurements of phosphorous, nitrogen, potassium, magnesium, sodium, manganese, iron, copper, and ash will be analyzed. These analyses will be conducted by the Auburn University Fishing Laboratory utilizing a Beckman atomic absorption spectrophotometer, Coleman flame photometer, and Bausch and Lomb Spectronic 20 colorimeter.

4.0129, STREAM RESTORATION AND CONTROLLED FLOWS

R.P. AUCLAIR, State Inland Fish & Game Dept., Augusta, Maine 04330

Objectives: To evaluate the effects of stream restoration and controlled water flows in the drainage.

Procedure: Some of the tributaries to Mooshead Lake have been used for log and pulpwood driving. This practice often results in a widened stream bed with a scarcity of pools and shelter. In some cases the banks are cleared to mineral soil for hundreds of yards to pile pulp prior to the drive. Recent policy changes to improve relations with the public have resulted in the use of company equipment to restore damaged streams. Restoration work was completed on one tributary stream recently and evaluation work will be included under this project. A water control dam with ample storage is included in the headwaters of this stream making it ideally suited for salmon and brook trout production. Restoration work is contemplated for other tributaries.

4.0130, SEDIMENTATION AND HYDROLOGY-ROCK CREEK AND ANACOSTIA RIVER BASINS, MARYLAND

W.J. DAVIS, U.S. Dept. of Interior, Water Resources Division, Baltimore - Towson, Maryland

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in the State of Maryland.

Purpose: To systematically appraise various erosion-reducing measures applied to land undergoing urbanization. To determine the effects of urban development on the hydrologic regime in the Northwest Branch Anacostia River basin.

Methods: A report will be prepared which shows the amounts of sediment released before, during, and after active urban land development in relation to upstream land use (quantity of land stripped of vegetation, etc.), erosion control measures instituted, and types of zoning. The report will include analysis of the sediment loads in relation to associated precipitation distribution and evaluation of any changes in streamflow characteristics (flood peak lag times etc.) and changes in channel geometry detected during and after urban development. The water level of an observation well with records which began in 1932 will be measured to evaluate changes in ground-water recharge resulting from urbanization.

4.0131, ANALYTICAL HYDROGRAPHY IN WATERSHED ENGINEERING

H.N. HOLTAN, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: The purposes of this project are to evolve and test new concepts, theories and principles for understanding the hydrologic processes on agricultural watersheds; to test and adapt information from various sources for application to water control and related problems encountered in watershed engineering; to conduct special analyses involving ARS data from more than one SEC Branch that can be more adequately carried out at a central location; and to provide case assistance to field personnel detailed to the Laboratory for specific analyses as requested by the SWC Branches.

Plan of Work: Hydrologic, geologic, soils, agronomic, and other information pertaining to the hydrologic performance of agricultural watersheds are compiled, analyzed, and interpreted by specialists in various disciplines for the evolution of new concepts and procedures for predicting flood flows and dependable yields of water from upstream watersheds.

4. WATER QUANTITY MANAGEMENT AND CONTROL

SUPPORTED BY U.S. Dept. of Agriculture

4.0132, DEVELOPMENT AND EVALUATION OF SURFACE AND SUBSURFACE DRAINAGE PRACTICES

J. LUNIN, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To develop for different land resource areas of the Northeast (a) methods and design criteria for interception drainage systems on wet, seepy, sloping lands, and (b) surface and subsurface design criteria for poorly drained flat areas of the Coastal Plains and Piedmont Valleys.

Plan of Work: In Vermont and New York attention is given to the problem of intercepting water on wet, seepy hillsides. Piezometers are being used to determine subsurface water movement and to evaluate criteria for the use of tile and interception drains as a means of drainage improvement in these areas. Hydraulic characteristics of soils and other physical factors affecting the drainability are also being investigated in order to develop the most effective methods of removing excess surface and subsurface water from these areas. In other areas the effect of soil management systems on soil-water relations is being investigated in conjunction with diversion and tile drainage systems. Field studies are being supplemented by laboratory investigations of basic principles including the drainage requirements of crops of importance to the area.

SUPPORTED BY U.S. Dept. of Agriculture

4.0133, WATERFOWL MANAGEMENT THROUGH WATER-LEVEL CONTROL

F.M. UHLER, U.S. Dept. of Interior, Patuxent Wildlife Res. Ctr., Laurel, Maryland

With the rapid loss of high quality wetlands, more intensive management of our poor quality wetlands becomes necessary if we are to maintain our waterfowl populations. Through water-level control such low quality wetlands as swamps, bogs, semi-dry marshes, gravel pits, and sewage lagoons can be of significantly increased importance to waterfowl. A series of impoundments have been constructed at the Patuxent Wildlife Research Center near Laurel, Maryland, to experiment with various water-level management techniques. Studies are being conducted on: 1. Impoundments held at full pool level the entire year; impoundments subject to an annual summer drawdown; impoundments subject to a biennial summer drawdown. 2. Impoundments cleared of timber before flooding; impoundments not cleared before flooding. 3. Green-tree reservoirs consisting of impoundments that are dewatered during the growing season and flooded during late fall, winter, and early spring. 4. Impoundments that receive effluent from a domestic sewage treatment field. 5. An abandoned gravel pit.

The effects of these experiments are measured by: 1. Weekly readings of water-level gauges. 2. Weekly waterfowl censuses. 3. Monthly samples of water quality. 4. Measurements of changes in plant composition.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

4.0134, OPTIMUM UTILIZATION AND MANAGEMENT OF WATER IN FORMATIONS HYDROLOGICALLY-CONNECTED TO A STRETCH OF THE CONNECTICUT RIVER

W.S. MOTTS, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

This study will recommend methods and procedures for the maximum development and beneficial use of aquifers that are hydrologically connected to the Connecticut River in southern Massachusetts with focus on the Springfield-Holyoke urban area. These underground reservoirs hitherto essentially ignored in regional water-resource development of southern Massachusetts may in the future be vital to the optimum growth of this part of the state. The study will include: (1) The location, characterization, and evaluation of aquifers containing potable water. The water-producing capacity and the safe yield of these aquifers will be determined. (2) Methods of artificial recharge will be proposed to recharge the developed aquifers so that the base flow

of the Connecticut River can be sustained. (3) Studies will be made of the feasibility of diverting Connecticut River water into the aquifers by induced pumping. (4) Methods will be investigated of increasing Connecticut River base flow by artificial recharge. It may be feasible to effect artificial recharge of floodwaters of the Connecticut River and its tributaries during periods of flood flows.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Massachusetts

4.0135, INTERACTIONS OF URBAN ACTIVITY AND THE HYDROLOGICAL CYCLE

E. MILLER, Abt Associates, Cambridge, Massachusetts

The proposed research is to: 1. investigate the question of the costs and the benefits of investment in pollution abatement aimed at expanding water recreation facilities, 2. to examine the potentialities of new directions in urban design that are made possible by the availability of waterfront land for other than transportation-oriented activity, 3. to conduct a reconnaissance into the technology of water supply and its alternatives to predict developing patterns of feasibility and highlight important trade-off margins among competing techniques and 5. to examine the industrial, aesthetic, residential, commercial and recreational interaction of an urban festival environment.

4.0136, THE IMPACT OF THE NORTHEASTERN DROUGHT ON THE PLANNING AND PROVISION OF MUNICIPAL WATER SUPPLIES

R.W. KATES, Clark University, Graduate School, Worcester, Massachusetts 01610

Significance: The Northeastern United States has experienced a long and severe drought over the past four years; the dry weather may continue. The drought has been costly to both the agricultural and urban sectors of the region's economy, but at present little is known about the size and incidence of these losses. At the same time, the drought has brought the subject of water supply to the public's attention as never before, creating a crisis atmosphere in which such diverse suggested remedies as higher prices for water and largescale sea water desalting programs compete for the public's attention and support.

Specific Aims: Professor Kates has already identified 50 communities in Massachusetts as the sample for his study. These communities represent a broad spectrum of experience in terms of the severity of drought conditions, adequacy of the underlying physical supply system, measures instituted to cope with the drought, and sophistication of planning procedures used. The cooperation of the Corps of Engineers, the Public Health Service, Geological Survey and relevant state agencies has been promised. The first objective of the study is to identify the characteristics of planning procedures used in communities where the drought impact was particularly severe and to contrast them with procedures used in communities experiencing little or no restriction of service. This will involve extensive interviews with system managers and acquisition of data on the dollar costs involved in either obtaining emergency supplies or in restricting water use. A second step will be to determine whether the range of alternatives considered in planning additional supplies was widened or narrowed by the pressure of drought crisis. Not only alternative physical systems, but institutional arrangements which would provide for system inter-ties and collaboration among separate political units will be considered. A third step involves measuring the effectiveness of various taken to reduce water use, including increased prices to water users. Relating to this, the financial condition of the utilities will be investigated and any financial difficulties induced by the drought will be noted.

4.0137, APPLICATION OF SEISMIC SHEAR WAVE STUDIES TO THE INVESTIGATION OF AQUIFERS

H.F. BENNETT, Michigan State University, Graduate School, East Lansing, Michigan 48824

4. WATER QUANTITY MANAGEMENT AND CONTROL

The general objective of this program is to evaluate the potential value of seismic shear waves in surface groundwater geophysical studies. Specifically, the generation and detection of seismic shear waves, by reflection methods, will be investigated under field conditions using asymmetrical charge distributions with respect to the receiver orientations. Laboratory velocity measurements of ultrasonic compressional and shear waves through simulated aquifers will permit the calculation of all the elastic moduli and Poisson's Ratio. These moduli will be correlated with the pertinent parameters of the material such as lithology, porosity, and water saturation. The empirical relationships determined in the laboratory will be compared with field data obtained in areas with good geologic control. It is suggested that the lithology and porosity of an aquifer can be determined from the measured compressional and shear wave velocities in the aquifer both above and below the water table.

4.0138, SMALL AGRICULTURAL WATERSHED HYDROLOGY

E.H. KIDDER, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Determine: rainfall distribution and intensity plus the frequency of recurrence of various intensities over the watersheds; relationship between rainfall and runoff; and quantity of sediment transported in runoff during major flow periods.

Description of Work: Recording raingages were placed at an approximate density of one per square mile on three small watersheds. Precipitation data are collected and analyzed from these gages. Continuous recording is made of the runoff from these watersheds. These flow data are reported as peak rates of flood flow and in inches of depth of runoff per month. Sediment content of the flood flow is obtained by sampling with a suspended load sampler.

4.0139, AN ATTEMPT TO DETECT HIGHLY DILUTED VIRUSES IN WATERS BY FLOCCULATION

W.N. MACK, Michigan State University, School of Veterinary Medicine, East Lansing, Michigan 48824

The proposed research work seeks a simple method by which a small amount of virus can be recovered from a large volume of water. Concentration of viruses from fluids can be accomplished by ultracentrifugation but this method is limited to special programs. The experimental program is to determine the amount of virus recovered by using a flocculant as compared to concentrating in the ultracentrifuge. Samples of sewage from different steps in the activated sludge system will be tested and compared. To determine the presence of virus, monkey kidney cell cultures will be seeded with the concentrated samples. No attempt will be made to identify the type of virus recovered. Special attention will be given to any relationship or trend between the reduction of biochemical oxygen demand and the amounts of virus recovered from the samples.

4.0140, REVIEW AND ANALYSIS OF PRECIPITATION AND RUNOFF DATA FOR SELECTED WATERSHEDS IN MINNESOTA

C.E. BOWERS, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

The proposed research will involve analysis of precipitation and runoff data for selected watersheds in Minnesota, with the objective of evaluating some hydrologic characteristics such as basin wide infiltration rates, hydrograph characteristics, significant storms and floods, and evapo-transpiration, relative to the physical characteristics of the basins. Data will be obtained from U.S.G.S., U.S.W.B., and State publications. Data will be analyzed on a highspeed digital computer using an 'optimization program.'

It is hoped that the study will contribute to a better understanding of the hydrology of the state particularly with reference to design criteria and flood routing procedures.

4.0141, VERTICAL MIGRATION OF MOISTURE IN THE SOIL INDUCED BY WINTER THERMAL GRADIENTS AND ITS INFLUENCE UPON SPRING WATER RESOURCES

D.G. BAKER, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

There is frequently an appreciable thermally induced migration of moisture within the soil over-winter from the lower warmer soil upward to the colder surface layers. As a result of the migration the upper portion of the soil increases in moisture content at the expense of the lower levels from which the moisture originated. A saturated zone at the surface may result. Thus spring meltwater and precipitation enter the soil slowly at best until the surface horizon moisture has returned to lower horizons from which it originated. The hydrologic importance of this is the fact that flood and surface soil erosion hazards are increased with early spring rains until the internal downward drainage has taken place.

The objective of this project is to determine the quantity of water involved in the migration, and if various soil management practices, which will alter the heat reservoir and surface insulation characteristics of the soil, will appreciably decrease the moisture movement. The measurements will be made in two plots which contain temperature sensors buried at various depths in the soil under different surface covers and treatments. Moisture measurements will be made regularly each week or as results dictate.

4.014, WATERSHED VALUES AS AFFECTED BY FOREST MANAGEMENT

D.P. DUNCAN, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

Objectives: (1) To study forest cover as related to frost penetration, snow distribution and melt, soil moisture, water infiltration and runoff. (2) To study soil erosion by water as related to forest cover condition and treatment. (3) To study bog hydrology as affected by vegetative cover.

Proposed work: Runoff collection equipment will be established on campus for the purpose of observing complications which may result in alternate freezing and thawing, particularly during the critical spring runoff period. The Whitewater installations will be modified and improved, field installations at Cloquet will be expanded, moisture and density measurements will be continued at all Cloquet stations, snow removal will be performed on the frost study plots, and laboratory studies will be performed in connection with the soil freezing studies.

SUPPORTED BY Minnesota State Government

4.0143, HYDROLOGIC CHARACTERIZATION OF SMALL WATERSHEDS

C.L. LARSON, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

Objective: The objective of the project is to investigate the use of mathematical, electrical, and physical models to study hydrologic phenomena of watersheds.

Description of work proposed: 1. To develop a comprehensive mathematical watershed model suitable for use in areas having freezing climates, such as the Upper Midwest. This would require translation and modification of the Stanford Watershed Model. 2. To use this model as a research tool to study the basic factors involved in surface runoff, and their relationships. This would be done by using the revised model on gaged streams, printing of intermediate data, and making studies with these data. 3. To develop a suitable technique for synthesizing peak runoff from rainfall data for ungaged small watersheds. This would be a major application of the relationships developed under Objective 02.

4.0144, THE EFFECT OF POTHOLE DRAINAGE UPON GROUNDWATER RESOURCES

P.W. MANSON, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

The agricultural benefits of drainage are well established and the practice of agricultural drainage is considered to be one of the first and most important steps in a well-planned conservation program for wet soils. As a result of extensive surface and subsurface drainage operations, many low-depression or pothole areas are drained so that these potholes will no longer hold water for long periods of time. There is a great deal of controversy about the effects of this drainage on water resources. Opposing views are held as to the beneficial, detrimental or neutral effects of drainage on the hydrologic cycle. This research is aimed at determining if the drainage effects floods or runoff and the groundwater supply of deep wells.

Thirty-seven potholes, located in the 6 major geological environments of Minnesota, will be under general observation, and 4 potholes will be operated under very precise instrumentation. All research will be directed to determine the exact hydrology behavior of the water in the potholes and in the surrounding ground. The use of chemicals, radioisotopes, and other means of 'tagging' water will be used. A tensiometer procedure will be established to measure the flow in unsaturated media. Small channels will be constructed under a few typical potholes so as to be able to better observe the water movement around these potholes.

4.0145, MECHANISMS OF BIOLOGICAL PRODUCTION IN STREAMS

T.F. WATERS, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

Identify plant community which serves as the primary producer of organic matter in streams. Determine relation between organic production and such environmental factors as nutrient content, light, and temperature. Clarify nature of trophic chain whereby basic elements are converted to plant organic matter, to grazing animal organisms, and finally to the carnivorous trophic level (fish). Contribute to ecology of stream organisms acting as secondary producers and as fish food.

Description of Work: Evaluation of tentative methods of estimating the production rate of stream bottom organisms is continuing. Drift rates are being measured between pools and riffles over a 24-hour period of time once each month; such drift rates, along with standing crop samples, permit the computation of production rate on the riffles, and consumption in the pools, in all seasons of the year. In the second method, an enclosure is being used to measure production rate on two types of stream bottom during all seasons. Several procedural and equipment problems are under study to add precision and greater efficiency, and allow further statistical treatment.

4.0146, IRRIGATION OF ROW CROPS

B.L. ARNOLD, Mississippi St. University, Agricultural Experiment Sta., Holly Springs, Mississippi

Objectives: To find the response of cotton irrigation at different nitrogen levels; to find the response of corn to irrigation at different nitrogen levels and plant populations, and the influence of irrigation on ear size and ears per plant.

Description of work: The cotton test is a split-plot design of six replications, irrigation being the whole plot, and nitrogen rates the sub-plots. Rates of nitrogen are 60, 90, and 120 lbs. per acre; a base application of 0-80-80 is applied annually. Sub-plots are four rows wide, 60 feet long. The two center rows are harvested. The corn test is a 2 x 3 x 2 factorial. Irrigation is the whole plot, nitrogen rates the sub-plot, and stand the sub-sub-plot. Nitrogen rates are 120, 180, and 240 lbs. per acre; stands are 8,000 and

12,000 plants per acre. Sub-plots are four rows wide, 60 feet long; sub-sub-plots are 27.5 feet long. Irrigation of both crops is done by judgment of when the crops need water.

4.0147, WATER RESOURCES OF COPIAH COUNTY

T.N. SHOWS, State Geol. Survey, Jackson, Mississippi

The water resources investigation of Copiah County was started in the summer of 1967. Emphasis was placed on obtaining information on the aquifers within the County as all domestic and industrial supplies are from ground-reservoirs. Surface water data is needed to provide information to industries which might be users of surface reservoirs to supplement ground-water supplies. The Pearl River which forms the eastern boundary is large enough to provide water to industry, except that upstream pollution has limited the usefulness of this water.

The Survey will be able to provide answers to questions of quantity, quality and availability of ground and surface water in Copiah County. Some of the methods used in collecting ground-water information in Copiah County are: running aquifer performance tests, monitoring water level changes, collecting water samples for chemical analyses, drilling test holes to determine the presence and extent of aquifers, inventorying existing wells with emphasis on the large industrial and municipal wells, and running electrical logs.

Records of stream flow, including maximum and minimum flow, and chemical analyses of surface water are being compiled from available published and unpublished sources. Low flow data and partial chemical analyses are being collected on various streams in the County.

4.0148, CITY OF JACKSON, WATER RESOURCES STUDY, MISSISSIPPI

C.P. HUMPHREYS, U.S. Dept. of Interior, Water Resources Division, Jackson, Mississippi

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Mississippi.

Purpose: To provide hydrologic data which will enable planners to design flood control measures, supplemental ground-water supplies for emergencies, and industrial water supplies.

Methods: Flood profiles and flood inundation maps for principal streams in the Jackson vicinity will be developed. Wells in the Jackson area will be monitored and significant changes in ground-water resources will be reported. Data on the color of water in the Sparta Sand and data for determining the potential of the Wilcox Group for industrial supplies will be collected. Site studies will be made where shallow ground seepage is a problem in city construction.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

4.0149, SMALL WATERSHED YIELDS

H.O. VAIGNEUR, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

To correlate the rate and quantity of runoff with the hydrological characteristics of the watershed. To determine the relationship of water yields from shallow wells to the hydrological characteristics of the area.

DESCRIPTION OF WORK - Typical agricultural watershed of 8,000 acres will be used. Maps showing soil types, slopes, and land use will be developed. Instrumentation includes rainfall amount and intensity, stream gaging for runoff measurements. Interpretation of precipitation-runoff relationship will include correlation of runoff yields to watershed characteristics.

Shallow well studies are similar to surface water yields. Wells will be pumped and records of yields analyzed in relationship to rainfall characteristics and character of the aquifers. Recharge rates will be determined.

Mississippi State Government

4.0150, SOIL AND WATER CONSERVATION MANAGEMENT

R.P. BEASLEY, Univ. of Missouri, Agricultural Experiment Sta.,
Columbia, Missouri 65202

Improve design of terraces and terrace systems. Determine the effect of terraces on power, labor and machine costs in crop production and on crop yields. Investigate new designs of erosion control structures and terrace outlets with a view to improving them and reducing their cost. Develop a method by which the erodability of different soils can be evaluated. Investigate use of land grading as it may improve the farmability of terraced land, as it may effect the spacing between terraces and as it may improve the efficiency of operation of farm machinery.

DESCRIPTION OF WORK - Terraces to be constructed on varying soil and topographic conditions to determine the extent that farmability can be improved. Cost of construction by different methods to be determined. The critical tractive force for different soils to be determined by hydraulic tests. The electronic computer to be used to solve the hydraulic flow equation for terrace grades and cross section. Experimental seedings to be used to select grasses adapted to erosion control in terrace outlets. Models to be used to investigate new designs of erosion control structures.

4.0152, GEOCHEMISTRY AND ORIGIN OF SULFO-SALINE GROUND WATER, SALINE COUNTY, MISSOURI

A.B. CARPENTER, Univ. of Missouri, Water Resources Research Ctr.,
Columbia, Missouri 65202

The purpose of this investigation is to contribute to a better understanding of: 1. the extent of chemical equilibrium between high-sulfide saline ground water and its environment. 2. the factors which control the accumulation and chemical evolution of high-sulfide saline ground water. The area to be studied during the project is Saline County, Missouri.

The project will consist of: 1. preparation of a geologic reconnaissance map of Saline Co., Missouri. 2. determination of Na, K, Ca, Mg, Cl⁻, SO₄²⁻, HCO₃⁻, pH, Eh, sulfide, and a preliminary investigation of Li, heavy metals, dissolved gases, and microorganisms in the sulfo-saline springs and wells in this area. 3. determination of the mineralogy, porosity and permeability of saline water producing strata. 4. preparation of hydrochemical facies maps. 5. calculation of selected ion activity products to determine the extent of chemical equilibrium between the water and its environment. 6. interpretation of the

data to determine as quantitatively as possible the origin of this sulfo-saline water.

4.0153, DRAINAGE OF AGRICULTURAL LANDS

C.F. CROMWELL, Univ. of Missouri, Agricultural Experiment Sta.,
Columbia, Missouri 65202

To study ground water conditions as they affect drainage needs. To determine drainage requirements of different crops. Determine effect of drainage on the physical condition of soils, the farmability of the drained area, and the growth and yield of crops. To study the different methods, develop engineering design data, and improve the techniques of drainage.

DESCRIPTION OF WORK - The effect of river stage on ground water table for land adjacent to levees will be studied at two Experiment Station farms. Laboratory studies of the effect of water table on movement of water into a soil profile will also be conducted.

The effect of surface ponding of water on growing plants will be evaluated on cotton in southeast Missouri. Corn and soybeans will be included if funds permit.

Comparisons will be made between well-drained and poorly drained plots as to timeliness of operations, farmability, etc.

The techniques for improving drainage such as land grading, ditching, and tiling will be evaluated.

SUPPORTED BY U.S. Dept. of Agriculture

4.0155, AVAILABILITY, DISTRIBUTION, QUANTITY AND QUALITY OF WATER RESOURCES IN CARBONATE KARST TERRAIN

J.C. MAXWELL, Univ. of Missouri, Water Resources Research Ctr.,
Columbia, Missouri 65202

The overall objective of this comprehensive, long-term investigation is to develop quantitative methods for determining the occurrence, movement, quantity, quality and availability of surface and subsurface water resources in a region of carbonate karst. Current studies are being conducted in an area of approximately 300 square miles in the Dry Fork Creek and Benton Creek watersheds southeast of Rolla, Missouri.

The specific objectives planned for July 1, 1967 to June 30, 1968 are (a) Continued collection of rainfall, runoff, and ground-water data to determine the effect of Karst terrain on the disposition of water; (b) Estimation of quantity of water stored in and flowing through bedrock of the area, using aquifer characteristics determined in a separate study; (c) Continued periodic characterization of surface and subsurface water quality in the area; intensive study of individual streams and related wells to ascertain effects of local accretions, losses and pollution. (d) Preliminary evaluation of availability of water by computation of a water budget which will be revised as additional data become available. (e) Examination of water quality data in relation to water budget data to identify direction, magnitude and effects of exchanges between surface and subsurface waters. (f) Tracer studies to enable confirmation of flow directions and velocities.

4.0156, FOREST COVER

L.K. PAULSELL, Univ. of Missouri, Agricultural Experiment Sta.,
Columbia, Missouri 65202

A. Study hydrologic processes of interception, infiltration, percolation, and detention-retention storage as related to living forest cover, non-living plant material on the soil surface, and plant residues incorporated in the soil body. Relate physical characteristics of Missouri forest soils to certain hydrologic processes. B. Test effects of forest land management on small watersheds.

Description of Work: Interception studies will be conducted using catch-troughs under a young oak canopy. Water levels will be determined in shallow well installations at University Forest. Infiltration rates will be determined for selected soil types under burning and grazing management. The effect of forest litter and soil organic matter will be determined. Frigipan effects on root development and water movement will be studied. Meteorological and runoff data will be collected from one watershed. Instrumentation of additional watersheds will be made as facilities permit.

4.0159, RECLAMATION AND MANAGEMENT OF SOILS ON IRRIGABLE LAND (MONTANA)

C.C. BOWMAN, Montana State University, School of Engineering,
Bozeman, Montana 59715

Study the interrelationships of N, P, & K fertility levels and irrigation regimes on the production of high quality malting barley on the Rebish and Helle Ranch of the East Bench Unit. Study crop response to eight fertilizer treatments and irrigation at four stages of plant growth to determine optimum use of water.

Salt Removal. Studies will be continued at the Huntley Branch Station and at off-station demonstrations on the effectiveness of reclamation of saline soils. Selected problem soils of Montana will be studied in the field. The removal of salts and improvement of soil properties will be monitored. The influence of clay type, salt status of the soil and salt status of the soil on salt and water movement is being studied.

Agricultural Engineering. Installation of operational automated irrigation demonstrations at Bozeman, Dillon and Huntley.

Development of a mathematical model predicting water movement and determining the effect of errors in the estimation of the variables on the predictive value of the velocity equation.

Continue evaluation of oval form border dykes on the yield of various crops.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

4.0160, METHODS OF CONTROLLING CLUBMOSS (SELAGINELLA DENSA RYDB) AND REDEVELOPING THE PRODUCTIVE CAPACITY OF RANGES FOLLOWING CLUBMOSS CONTROL

M.J. BURNIS, Montana State University, Agricultural Experiment Sta.,
Bozeman, Montana 59715

Objectives of the study are: (1) To determine through laboratory studies the responses of clubmoss to environmental factors of temperature light, and water relationships affecting, establishment, maintenance, and reproduction. (2) To determine through field studies, the adaptability of ecotypic selections of nature species and techniques for their establishment on clubmoss infested ranges through mechanical and/or chemical removal of clubmoss and other competitive vegetation as well as effects of additions of plant nutrients.

Procedures include lab, greenhouse, and field methodology to provide knowledge of: (1) Infiltration, percolation, and runoff on clubmoss ranges; (2) Rooting depth, effects of variable moisture supply on spore formation and germination; influence of light intensity on clubmoss; (3) Methods and species for planting on clubmoss-infested ranges; (4) Vegetational components of undisturbed clubmoss ranges by means of transects and clipping plots; (5) Soil moisture, soil temperature, bulk density and nitrogen determination of soil, light intensity, evaporation, from soil surface, air movement, and precipitation; (6) Herbicides and their carriers for clubmoss control.

4.0161, INTERAGENCY FRAIL LANDS STUDY - MONTANA IV. WATER QUANTITY MANAGEMENT

F.H. SIDDOWAY, U.S. Dept. of Agriculture, Sidney, Montana
59270

Frail lands are lands that are highly susceptible to accelerated erosion by either wind or water. They are characterized, usually, by steep slopes, highly erodible soils and soil materials, and poor vegetative cover. The frail lands in this study are range-lands in the Pierre Shale plains and Badlands resource area comprised of (a) Solodized-Solonetz soils, (b) Raw Shale soils, and (c) Solonchak soils.

Objectives: To evaluate the effects of conservation practices (primarily contour furrowing) on vegetative response and surface runoff on frail lands and to provide information which may be used as guidelines for making management decisions on the frail land resource areas.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Procedures: Three sites will be selected, each of which will be characteristic of one of the main soil or topographic features of the frail lands. Within each site, six homogeneous watersheds of 2-3 acres each will be selected and instrumented to obtain climatic data, surface runoff yield, soil moisture, etc. Other watershed characteristics will be inventoried by detailed soil and vegetation surveys; following which, nine watersheds will be mechanically treated by contour furrowing. Effects of furrowing, and, runoff relationships taking into account hydrologic characteristics such as cover type and density, land use, soil type, ground litter, bulk density of surface soil, and changes in soil moisture.

4.0162, UTILIZATION OF THE STORAGE POTENTIAL OF RIVER VALLEY AQUIFERS (ABBREV)

R.R. MARLETTE, Univ. of Nebraska, School of Engineering, Lincoln, Nebraska 68508

The Water Resources Research Category of this project would be IV. Water Quantity Management and Control, Groundwater Management. The first work would augment the meager water quality data available in the lower Platte River basin with a systematic sampling and analysis of the physical, chemical and biological features of these rivers' water. The aim would be to determine the important characteristics and develop simplified testing procedures for using river water to recharge valley aquifers.

The seasonal quality of the Elkhorn, Loup and Platte rivers will be analyzed to determine the treatment, if any, that may be required in order to use these waters to recharge through infiltration basins located near production wells. The sampling will take place within a fifty mile radius of Lincoln, Nebraska. Some of the analysis will be done in the field, but most of this work will be performed in the Sanitary Laboratory of the Civil Engineering Department.

4.0163, ENGINEERING AND AGRONOMIC STUDIES ASSOCIATED WITH LAND SHAPING, ETC.

H.D. WITTMUSS, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

Evaluate land shaping practices in regard to conservation of moisture, and amount and stability of crop production in western Nebraska. Develop effective agronomic and engineering practices for use in farming conservation bench systems.

Description of work: A 15 acre field in western Nebraska was shaped into conservation benches and level benches to conserve moisture and eliminate runoff and erosion. Some of the contributing areas have been covered with galvanized roofing material in order to divert extra water on to the level benches.

The land is to be cropped annually in an area where summer fallow is a common practice.

A study was made of construction procedures on bench system with the objective of keeping the cost in line with other types of construction. The best known fertility practices were followed in an attempt to bring the cut areas into high production as soon as possible.

Several different crops are being grown on the benches to determine the potential effect of water control on crop production.

A record is being made of the soil moisture. This will be used to determine the system of water control which will give the highest use-efficiency of rainfall.

4.0164, DRAINAGE SYSTEMS FOR THE GREAT BASIN

L.S. WILLARDSON, U.S. Dept. of Agriculture, Reno, Nevada

Objective: Determine flow rates from artesian wells and feasibility of drainage of artesian basins with wells and surface drains. Develop basic drainage design.

Plan of Work: Obtain additional data on causes of drainage problem in Fallon, Nevada study area by correlating groundwater contour maps, soil stratification and flow net patterns with conductivity measurements, water application per season, etc. Complete survey work and process data on study of drainage by pumping from wells in an artesian aquifer.

SUPPORTED BY U.S. Dept. of Agriculture

4.0165, DRAINAGE DESIGN FOR IRRIGATION AGRICULTURE

C.T. BOURNS, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Objectives: 1. To determine the characteristics of flow of drainage relief (up) wells and gravity drains located overlying an artesian aquifer, and, in particular, the phenomena of flow in the immediate proximity of the well or drain. 2. To determine the interaction effects of drainage (up) wells and open ditches used conjunctively. 3. To determine the feasibility of this type drainage. 4. To develop design criteria for drainage facilities where high water tables are produced by artesian pressures and irrigation.

Work Proposed: To study in the field and the laboratory the characteristics of and factors influencing flow into an open drain and drainage relief (up) wells on land overlying an artesian aquifer using meters to measure flow from the wells, Parshall flumes to measure flow in the ditch, and piezometers to measure pressures in the ground water and the artesian aquifer. Data and parameters developed from the field study will be utilized in appropriate model studies in the laboratory to further study pertinent parameters and theoretical variations in natural conditions influencing flow into these drainage facilities.

SUPPORTED BY U.S. Dept. of Agriculture
Nevada State Government

4.0166, MOUNTAIN MEADOW RESTORATION

R.E. ECKERT, Univ. of Nevada, School of Agriculture, Reno, Nevada 89507

Objectives of the study are: (1) To impose various restoration practices on experimental meadows. (2) To measure the effects of restoration practices on meadow condition and forage production. (3) To determine effects of restoration on wildlife and livestock. (4) To evaluate restoration practices in terms of water, soil and vegetation conservation and improvement and livestock and wildlife production. (5) To determine which restoration practices can be best recommended for similar meadows in similar condition.

Procedures to fulfill objectives include: (1) Construction of 'gully plugs' to raise the water table and their effect on depth and fluctuation of the water table as it influences native vegetation. (2) Source of ground water and hydrostatic pressure of water table. (3) Siltation of reservoirs to determine quantity of sediment carried and life of the reservoir behind the 'gully plug'. (4) Measurement of streamflow. (5) Mapping of vegetative sites and evaluate improvement practices such as protection, fertilization, weed control, seeding improved species, and combinations of these practices. (6) Determination of soil characteristics and climatic factor will permit application of best practices to similar meadows.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0167, EVAPOTRANSPIRATION PATTERNS OF FOREST AND BRUSH VEGETATION ON THE EAST SLOPE OF THE SIERRA NEVADA

R.O. GIFFORD, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Objectives: 1. To determine evapotranspiration patterns of forest and brush vegetation on east slopes of the Sierra Nevada watersheds. 2. To evaluate and adapt procedures for estimating evapotranspiration from environmental measurements for use in mountain forest-brush areas. 3. To relate evapotranspiration patterns of various species to soil, plant and climatic factors.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Evapotranspiration rates of brush and tree communities will be measured by soil moisture depletion using the neutron probe technique. Environmental measurements are to be made to permit calculation of evapotranspiration by various methods. New methods of measurement will be considered and applied where possible. Root distribution of the species studied will be estimated from soil pits. Soil moisture depletion is to be related to root distribution as well as environmental measurements.

4.0168, CULTURAL PRACTICES ON EASTGATE BASIN
D. JAGER, Univ. of Nevada, School of Agriculture, Reno, Nevada 89507

This study was initiated July 1, 1965, with an anticipated completion in June, 1970. The main objectives of the study are to evaluate the effectiveness of various cultural practices in reducing sediment production and overland flow on frail lands and to obtain hydrologic data needed to interpret and project results. Two areas in the sagebrush type are being studied. Practices being tested include plowing, ripping, furrowing and spraying together with seeding of wheatgrasses. Runoff and sediment are collected and measured in 55-gallon drums. Other data being collected include rainfall, soil moisture, plant cover, bulk density, porosity and water storage capacity.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0169, THE ECONOMICS OF WATER TRANSFER - AN APPRAISAL OF INSTITUTIONS

J.B. WYCKOFF, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

OBJECTIVES: 1. To appraise the legal-institutional-administrative devices and processes through which transfers of water between uses and users take place and 2. To assess the consequences of these devices and processes on the economic efficiency and equity of water use and 3. To suggest desirable modifications in these devices and processes that might enhance economic efficiency or equity in the use of water resources.

Nevada will collect all available data on the historical flows, diversions, and use of the water in its closed river systems. Historical changes, present patterns and possible use within existing institutions will be determined.

Normative models will be developed and examined to determine what the water use might be under conditions of maximum economic efficiency.

Finally, alternative changes in the existing institutional framework which could effect a conversion from the existing use pattern to one of maximum economic efficiency will be examined.

4.0170, THE INFLUENCE OF WETLANDS ON QUANTITY AND QUALITY OF STREAM FLOW

G.L. BYERS, Univ. of New Hampshire, School of Agriculture, Durham, New Hampshire 03824

Losses by evaporation, transpiration, or evapotranspiration diminish the available water supply by one half. The period of greatest water demand does not coincide with the greatest period of supply. Substantial amounts of water are lost from drainage basins with their wetlands and ponds tributary to the streams. Therefore, a better understanding of the hydrology of the wetlands and ponds could be a valuable contribution toward augmenting water supply during periods of low stream flow.

The meteorological data which are required for determining evaporation and evapotranspiration will be measured at a selected wetland site near the university campus. Humidity, air temperature, wind speed, and net radiation will be measured from a tower at one elevation, above land surfaces. If necessary, ground-water levels and soil moisture will also be measured, and stream gaging performed. Chemical samples will be collected and some measurements made in the field. Eight chemical measurements and conductivity will be determined in the laboratory.

Solution of equations and statistical analysis of the data will be by computer programs.

4.0171, SOIL DRAINAGE

R.B. ALDERFER, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

Objectives: 1. Measure levels of water saturation in different representative types of imperfectly to very poorly drained soils in New Jersey.

2. Measure the physical and chemical characteristics of these soils.

Procedure: Measurement of levels of water saturation will be made periodically (weekly) with piezometers, in representative imperfectly to poorly drained soils in N. J. Amount of accumulated rainfall will be measured each time piezometers are read. These data will be plotted regularly to provide a continuous record for each site. Physical and chemical properties of each soil horizon will be made at selected sites to determine whether any of these properties is related to or correlated with degree of wetness as influenced by water table level.

4.0172, SURFACE AND GROUND WATER POTENTIALITIES OF THE MULICA RIVER BASIN

M.L. GRANSTROM, Rutgers The State University, School of Engineering, New Brunswick, New Jersey 08903

The proposed research project involves a systems analysis study and an ecological field investigation of aqueduct water transfer from the Mullica River Basin (containing a large state water reserve) to several New Jersey cities. This study will determine the: 1) cities which will have future demands for Mullica River water 2) optimum conjunctive surface and ground water development 3) economic effects of water withdrawal on shellfish, other biota, recreation, and waste assimilation capacity of the river and estuary.

The systems analysis approach will involve applications of extremal mathematics, such as linear programming, or simulation and stochastic processes. Fish spawning and nursery grounds studies and plankton dredging surveys will determine the distribution of these biota with respect to the existing and projected hydrography of the river-estuary system. Dissolved oxygen, salinity, and other water quality parameters will also be measured for the mathematical model. Project results will be applicable to other river basins which have conjunctive surface and ground water potentialities which affect the estuarine ecology.

Rutgers The State University

4.0173, HYDROLOGY OF SUBURBAN AREAS

K. NATHAN, Rutgers The State University, School of Agriculture, New Brunswick, New Jersey 08903

The objectives of the proposed study are: a. To determine the effect on the rainfall-runoff relationship on all watersheds in Central New Jersey as the land use changes from agriculture and forestry to suburban development. b. To study the impact of this change on local water resources. c. To determine the practices which will best contribute to proper conservation of existing water and soil resources in agricultural areas undergoing suburban development.

Rainfall will be measured by recording rain gauges with punched paper tape output. Runoff will be obtained by means of stage recorders with punched paper tape output. It is hoped that precise lag time relationships can be developed. Pertinent parameters of the watershed will be determined from available aerial photographs and contour maps. Surveillance on land use will be kept by inspection.

4.0174, PERFORMANCE OF DRAINAGE SYSTEMS

K. NATHAN, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

Objectives: To obtain basic engineering data on the performance and effectiveness of existing tile and open ditch installations as a basis for rational design procedures for such systems.

Description of Work Proposed: The effectiveness of drainage systems will be evaluated in terms of water table drawdown. Observation wells will be used. Hydraulic conductivity of the soil will be established by visual evaluation, laboratory tests of core samples, and in situ determinations. Mosquito control ditches will be studied by determining stage, velocity, slope and other hydraulic variables. Sites representative of various major soil and geographic conditions will be selected. Ditches of various hydraulic characteristics will be selected or constructed.

4.0177, CHEMICAL CONTROL OF CREOSOTE BUSH AND MESQUITE

M.L. WILSON, New Mexico State University, Agricultural Experiment Sta., Las Cruces - University Park, New Mexico 88001

The overall objective is to develop methods for rehabilitating creosotebush and mesquite-infested sites to maximize watershed, wildlife, and forage values. This will be done by determining proper sequence of aerial spraying; proper herbicides, additives, and carriers; effect of brush control on vegetation response and soil stabilization in dune areas; most effective herbicidal treatment for brush control by spot treatment with granular herbicides; successful reseeding practices including optimum methods,

rates, and dates for various sites, weedy vegetation reduction, insect and rodent control, managing seeded stands for maximum production, and adaptation of new grass introductions to arid semidesert conditions; and evaluation of vegetation types and sites as to suitability for various treatments.

Effectiveness of repeat sprayings at various intervals on mesquite control is being determined under grazed and ungrazed conditions. Combinations of dicamba, 2,4-D, and 2,4,5-T are being used.

Various herbicides are being screened for effectiveness in controlling mesquite and creosote-bush, and labelled herbicides are used to trace absorption and translocation.

Vegetation response to mesquite control will be evaluated using line transects through duned areas. Such treatments will be replicated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0178, STREAM FLOW REGIMES ON A SEMIARID RANGELAND WATERSHED

R.B. HICKOK, U.S. Dept. of Agriculture, Santa Rosa, New Mexico 88435

Objective: Determine relations of storm flows to storm patterns, runoff source-area characteristics, and hydraulics of the stream channel system.

Plan of Work: Categorize storm patterns in relation to runoff-producing potential and relate to frequencies of occurrence, determine runoff response characteristics of land areas as affected by topography, geology, soil, vegetation, and cultural practices, and determine runoff transmission characteristics of the stream channel system components, to derive equations for prediction of runoff hydrographs for the watershed system.

4.0179, THE NANGARHAR CANAL PROJECT OF EASTERN AFGHANISTAN

C.H. EBERT, State University of New York, Graduate School, Buffalo, New York 14214

This investigation focuses on the impact of the Nangarhar Canal Project in the regional development of Eastern Afghanistan.

The Nangarhar Canal Project was launched in 1956 by an investigation of a Soviet Russian team which investigated the feasibility of a regional, agro-industrial plan based upon hydro electric power and irrigation development.

The investigator established working contacts with the Russian and Afghan personnel at the Jalalabad headquarters of the project and was permitted to engage in extensive field work within the project area. Of particular interest were new soil reclamation techniques aimed at overcoming unfavorable textural and structural soil characteristics, soil desalinization, and specialized land use planning.

The focal point of the investigation is the hydrology of the area, its soils, and climatic factors correlated with land use planning.

4.0181, AN EVALUATION OF THE REJUVENATION OF THE BUFFALO RIVER

R.A. SWEENEY, State University of New York, Graduate School, Buffalo, New York 14214

Some of the effects of the low flow augmentation project on the Buffalo River will be evaluated. At three (3) stations along the river's length water and sediment analyses will be conducted. The water will be measured according to Standard Methods for pH, conductivity, suspended and dissolved solids, alkalinity, chlorides, total PO₄ phosphates and total nitrogen. Sediments will be examined for volatile solids, total iron, oils and greases, COD, total nitrogen and total PO₄ phosphates. In addition, quantitative analyses of macrobenthos will be made.

The results of this survey will be contrasted to studies made on the Buffalo River prior to the initiation of the flow augmentation project.

SUPPORTED BY Allied Chemical Corporation

4.0182, DRAINAGE STUDIES OF NEW YORK SOILS

P.J. ZWERMAN, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

Objects: 1. To study the soil-water relations in typical poorly drained soils. Many of the attempts that have been made to drain these soils have failed because the trouble was not properly diagnosed. 2. To devise the simple and cheap techniques for draining the various types of wet land encountered in this study. With bulldozers, mechanical ditchers, subsoil plows and other power equipment now commonly available, it may be possible to find economic solutions to this problem.

Procedure: The problem will be attacked by isolating the drainage problem locations by soil areas and land management systems. Experimental drainage systems together with modifications of the land management will be introduced in an attempt to find out what combination of drainage systems and land management is the most successful for the various drainage locations. Agronomy Department lands are to be used wherever possible. State owned and private lands will also be used for experimental locations.

4.0183, ARTIFICIAL RECHARGE OF TREATED SEWAGE WATER AT BAY PARK, N.Y.

G.D. BENNETT, U.S. Dept. of Interior, Water Resources Division, Mineola, New York 11501

The objective is to evaluate the feasibility of and develop optimum methods for injecting water from highly treated sewage-plant effluent into deep artesian sand aquifers of the Magothy(?) Formation (upper Cretaceous) of Long Island. This formation, which is the principal source of the water supplies for Nassau and western Suffolk Counties, is being pumped intensively and locally is being invaded by salty water. Extensive artificial recharge through injection wells with reclaimed waste water may be needed for water conservation and to create fresh-water pressure ridges to retard sea water.

Water from sewage-plant effluent will be further treated to a potable quality and then injected under pressure through specially designed wells (with fiberglass casings) under various experimental conditions. Data on hydraulic and geochemical results of the injection will be collected using observation wells and special in-situ geochemical sensors.

This research is part of the program of water resources investigations being carried on in cooperation with the County of Nassau, N.Y.

4.0185, PEACH NITROGEN, PRUNING AND IRRIGATION STUDY

W.E. BALLINGER, Univ. of North Carolina, Agricultural Experiment Sta., Raleigh, North Carolina 27600

Objectives: To determine the effects of different levels of pruning, N, soil moisture, and their interactions on peach tree survival, growth and fruiting characteristics.

Description of work proposed: Two hundred and sixteen treated trees of the Redhaven and Elberta varieties were established in a split-split-split block designs at the N. C. Peach Experiment Station near Jackson Springs, N. C. in 1953 using three levels each of pruning and N. The two moisture levels used were normal rainfall and normal rainfall plus supplemental water. Measurements of tree growth and fruiting characteristics have been made since 1956 and will continue to be made until the decline of the planting. Longevity and probable causes of decline are to be studied.

SUPPORTED BY North Carolina State Government

4.0186, DEVELOPMENT OF CRITERIA FOR ADEQUATE DRAINAGE

G.J. KRIZ, Univ. of North Carolina, Agricultural Experiment Sta., Raleigh, North Carolina 27600

Evaluate relation between geometry of drainage systems, soil characteristics and soil moisture on a subsurface drained land. Study effect of water table behavior on plant growth. Develop appropriate methods of measuring variables pertinent to study of these objectives. Ultimately, devise rational method of designing drainage systems, taking account of weather uncertainties, crop needs and hydraulic behavior of soil-water complex.

Description of Work: Plants are to be grown at different moisture

conditions obtained by maintaining different water table depths

in tanks. Soil moisture conditions can be evaluated using neutron

scattering, gamma densitometry and tensiometers. Soil aeration

will be studied with the platinum electrode technique. Soil aeration will be studied with the platinum electrode technique.

Results are to be evaluated in terms of growth response and daily

measurements of evapotranspiration rates. Some tanks will be

buried outdoors even with the soil surface; others are to be installed outdoors but will be protected from rain with movable

shelters; others are to be inside in a growth chamber.

4.0187, WATER SUPPLY FROM AGRICULTURAL WATERSHEDS AND UTILIZATION IN IRRIGATION

E.H. WISER, Univ. of North Carolina, Agricultural Experiment Sta., Raleigh, North Carolina 27600

(a) Develop methods for predicting water yields from small agricultural watersheds. (b) Obtain probability of occurrence of drought days and of days having excessive moisture. (c) Use approximate methods to solve moisture flow patterns in irrigation.

An analysis will be made of records of runoff, rainfall and other pertinent factors to develop methods of predicting probability of occurrence (1) soil moisture deficits, (2) days with moisture deficits, (3) soil moisture excesses, (4) runoff; and of predicting amounts of these deficits and excesses. These factors will be related to irrigation management. Machine techniques will be developed for studying flow patterns for water through unsaturated soil in order to evaluate water movement under irrigation and drainage.

SUPPORTED BY North Carolina State Government

4.0188, ECONOMICS OF WATER MANAGEMENT TECHNIQUES IN NORTH DAKOTA

W. MCMARTIN, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objectives: To determine and evaluate the economic aspects of current and newly developing technology of water management applicable to both dryland and irrigated agriculture in the Northern Great Plains Region.

Approach: Specific techniques of irrigation and moisture conservation will be evaluated in terms of their effects on the relative efficiency that water and other resources are used in agricultural activities. Immediate attention is being devoted to a comparative economic analysis of recently developed irrigation techniques. Following this, an economic analysis of level bench terracing will be undertaken. Additional water management practices and techniques will be selected for study after completion of the first two analyses. Close cooperative working relationships will be established with ARS and State Experiment Station scientists to obtain experimental data required for the analyses. Additional data requirements will be met by personal interview surveys.

4.0191, IMPROVEMENT AND MODERNIZATION OF SURFACE AND SUBSURFACE DRAINAGE PRACTICES AND FACILITIES IN THE CORN BELT

R.C. REEVE, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Object: To improve surface drainage systems on farms for high level crop production and effective use of modern farm machinery. To develop equipment and methods for installation of low cost subsurface drains and to determine the feasibility of their use.

Plan of Work: Studies will be conducted to determine effectiveness and design features of subsurface drainage systems. This involves field and laboratory measurements of hydraulic conductivities and piezometric pressures for determining tile depth and spacing with electrical analog procedures. Studies concerned with the feasibility of low cost drains include evaluations of various plastic and other materials and the development of methods of installation of these materials. Work includes development of grade control devices. Landforming and improved water management measures are being developed which will assure efficient farm drainage systems. Drainage systems and related tillage management procedures are developed to provide necessary surface and subsurface water control under various soil and cropping conditions

SUPPORTED BY U.S. Dept. of Agriculture

4.0192, SURFACE AND SUBSURFACE DRAINAGE FOR SLOWLY PERMEABLE SOILS

G.O. SCHWAB, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Determine relative effect of no drainage, surface drainage alone, tile drainage alone, and combination of both surface and tile drainage on crop response, soil moisture conditions, and other soil physical characteristics. Determine tile outflow, surface runoff, and soil and plant nutrient loss data for improving design standards of drainage systems. Determine effect of time on backfill consolidation over tile. Determine effect of soil moisture level on the physiology of the plant under field conditions.

Description of Work: A field experiment was installed in 1958 in

a heavy-textured lakebed soil to evaluate the effectiveness of surface and tile drainage. There are sixteen one-half acre plots

which include four replicates of four treatments. To accelerate

the collection of data the plots are irrigated once or twice each

year to produce the desired degree of wetness. Tile and surface

flow, water table depths, soil moisture, and oxygen diffusion rates are the principal measurements. Yields from corn and

oats

will be taken. Crops will be changed from year to year to obtain

maximum results.

4.0193, METHODS AND EQUIPMENT FOR SUBSURFACE DRAINAGE

G.O. SCHWAB, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Develop and test new principles for controlling grade on trenching machines. Develop and test various types of materials and methods for improving subsurface drainage.

Description of Work: The first step in developing a grade control device will be to adapt the pendulum method now being

4. WATER QUANTITY MANAGEMENT AND CONTROL

developed in cooperation with the ARS. This device will be mounted on a trenching machine and field tests performed. Since such a device only assures that a grade is maintained, another method needs to be devised to establish a reference grade line. Infrared light or other devices will be investigated.

A continuation of field studies started under State Special 91, drain discharge and sediment outflow measurements from 1-inch plastic drains and from the fiber glass drains will be made for several years. The improvement of sediment and clogging of fiber glass around drains will be studied in cooperation with Hatch 230. Continued studies will be made on the effect of deviations from true grade for drains less than 2 inches in diameter. In cooperation with ARS the possibilities of zippering plastic drains less than 2 inches in diameter will be investigated.

SUPPORTED BY U.S. Dept. of Agriculture
Ohio State Government

4.0194, SOIL CHARACTERISTICS AFFECTING SUBSURFACE DRAINAGE

G.S. TAYLOR, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

(1) Study effect of soil hydraulic conductivity, deep seepage, and drainable porosity on water removal by subsurface drainage systems. (2) Determine saturated hydraulic conductivity and drainable porosity of the Gray-Brown Podzolic, the humic Gley, and the Gray-Brown Podzolic Acid Brown soil groups. (3) Study by various laboratory techniques the effect of subsurface drainage systems on water removal for those soil profile conditions revealed through objective 2.

DESCRIPTION OF WORK - The effect of soil hydraulic conductivity (permeability) and drainable porosity on drainage are being evaluated by controlled laboratory experiments. These experiments utilize tank drainage models, an electrical resistance network, and an IBM 704 electronic computer. Monolith samples are being taken from field soils to evaluate hydraulic conductivity and drainable porosity. This information is utilized in controlled laboratory studies to evaluate the effect of subsurface drainage systems on water removal from land.

4.0195, MILL CREEK VALLEY ANALOG MODEL STUDY, OHIO

R.E. FIDLER, U.S. Dept. of Interior, Water Resources Division, Columbus, Ohio

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Ohio.

Purpose - To prepare an analog model of part of the Mill Creek Valley and study the effect of various plans to utilize injection wells to increase recharge to the aquifer presently in use.

Method - An inventory of ground-water pumpage will be made. Water levels will be measured periodically. Maps showing well locations, bedrock surface, historical and current water level contours, water-level change contours, and hydraulic properties, will be prepared.

The assembled data will be used to program an electric analog model which will be used to demonstrate the effects of various combinations of injection well systems and combinations of withdrawals.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Ohio State Government

4.0196, SPRINGFIELD AREA INFILTRATION STUDY, OHIO

S.E. NORRIS, U.S. Dept. of Interior, Water Resources Division, Columbus, Ohio

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Ohio.

Purpose: To investigate variations in rates of induced recharge from streams to sand and gravel aquifers under natural

conditions and to determine methods and techniques for artificially increasing the rate of recharge to sand and gravel deposits.

Methods: Measured loss in streamflow will be correlated with records of pumpage, evapotranspiration losses, and changes in storage in the aquifer. The unit rate of induced infiltration will be related to water temperature, sediment load, head in the stream, and other factors to find out what conditions mainly control infiltration rates. Pumping tests will be made to determine the transmissibility and storage properties of the aquifer to estimate the quantity of water represented by head changes in the aquifer. Water-level contour maps and change maps will be constructed for various conditions of flow and ground water levels to help define the conditions of infiltration.

4.0197, HYDROLOGIC CHARACTERIZATION OF SMALL WATERSHEDS

R.B. CURRY, Ohio Agric. Res. & Dev. Ctr., Wooster, Ohio 44691

Regional Objective: To investigate the use of mathematical, electrical, and hydraulic models to study hydrologic phenomena of watersheds.

Specific Objectives: 1. To investigate statistical models as a means of identifying and evaluating the pertinent variables in the runoff process. 2. To use these variables together with a mathematical model to predict behavior of a small watershed.

The behavior of small watersheds will be investigated to identify the pertinent variables using the statistical theory. These variables will be combined with the underlying physical and biological phenomena to develop a mathematical model which will permit statements to be made about probable watershed behavior. Data from existing watersheds and runoff plots will be used to test the validity of the model.

4.0198, SOLUBILITIES OF SILICATES IN SALINE WATERS

A.G. COLLINS, U.S. Dept. of Interior, Bureau of Mines, Bartlesville, Oklahoma

The objective of this research has been to obtain solubility data on silicates, in particular on silicates which form scale deposits on heat transfer surfaces during distillation of saline waters. The effect of such factors as temperature, pressure, pH, and dissolved gases is being investigated, and a hydrothermal apparatus has been specially constructed for the project. Solubilities of a few silicates have been determined in water, sodium chloride, magnesium chloride and sodium bicarbonate solutions.

The solubility experiments are continuing. The hydrothermal apparatus has been put in operation, and solubility measurements are being completed on the silicates of most concern in saline water technology.

4.0199, PREPARATION AND ANALYSIS OF CLIMATOLOGICAL DATA IMPORTANT TO AGRICULTURE AND FORESTRY

W.P. LOWRY, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. To determine patterns and variability of climate. 2. To associate phenological response with climatic data. 3. To develop interpretations of phenological and climatic data for agricultural and other applications.

Description of Work Proposed: Oregon's participation will center on precipitation duration. Sequential relationships of weather events related to precipitation will be described for the Western Region. Experience tables of the lengths of wet and dry spells which have occurred at various stations and at various times will be computed and published rather quickly for immediate use. The theory of Markov processes will be utilized.

Oregon will also contribute to the proposed manual on synoptic climatology of various weather variables. The probabili-

4. WATER QUANTITY MANAGEMENT AND CONTROL

ty of occurrence of significant weather events associated with certain weather types will be assessed. This study has possibilities of being related to causes of air pollution.

4.0200, FACTORS INFLUENCING THE FLOW OF SUB-SOIL WATER IN THE IMMEDIATE PROXIMITY OF AND INTO DRAINAGE FACILITIES

J.W. WOLFE, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: To analyze and describe the sub-surface flow of water and those factors which affect it in the immediate vicinity of the drain facility for the preparation of improved criteria and procedures for design, installation, and operation of drains.

Work Proposed: An attempt will be made to describe the flow of water in the close proximity to tile drains for the transient state by using the diffusion equation. Computer programming to solve this question, now complete in one dimension, will be continued by extending to two dimensions and by inserting appropriate boundary conditions at the drain and zone changes at the filter and at impeding soil layers.

Laboratory measurements of drydown in the soil will be made to confirm the computer results. Measurements of hydraulic conductivity and diffusivity will also be made in the laboratory. Field measurements using organic material for backfill or filter will be made as further confirmation of the theoretical solution.

4.0201, SOLAR POWERED EQUIPMENT FOR OPERATING A SMALL IRRIGATION PUMP.

M. ANWAR, Pakistan Atomic Energy Comm., Lahore, Pakistan

Object: To develop and design criteria and specifications for a 2-hp solar powered boiler and equipment using steam or other media for operating a small irrigation pump.

Plan of work: The following investigations will be conducted in the laboratory and in the field: A pilot system will be developed at the Atomic Energy Center, Lahore, West Pakistan consisting of a 400-sq. ft. parabolic reflector, a boiler and an engine or turbine powered irrigation pump. If time permits, consideration will be given to other fluid media that may be more efficient than steam at low temperatures. The mirror reflector will be installed on the roof of the Atomic Energy Center and the steam boiler, turbine and pump assembly so located that water can be pumped from the ground floor to the roof simulating the pumping from a well. This will allow observation and easy modification. Tests will not be made on an actual well until the unit is perfected. After perfection it will be placed in a well for field test. This can be done in the immediate vicinity or on the grounds of the Center as the water table is quite high.

4.0202, ORGANISMS WHICH ATTACK THE AQUATIC PLANT, EURASIAN WATERMILFOIL IN PAKISTAN

M.A. GHANI, Comm. Inst. of Biolog. Control, Rawalpindi, Pakistan

Object: To conduct explorations to discover insects, other plant-feeding organisms or plant diseases which attack Eurasian watermilfoil (*Myriophyllum spicatum*) to determine the degrees of host-plant specificity of any organisms that appear potentially useful for control of the plant; and to supply living specimens of potentially useful organisms to the U. S. upon request.

Plan of work: Arthropods and other organisms associated with watermilfoil will be studied in several locations in East and West Pakistan throughout the seasons of year when conditions are favorable. Samples of such organisms will be preserved and classified, and specimens supplied for study or deposit in the National Collections, if requested. Detailed observations will be made on any of the organisms which appear to be important control factors and which appear to be suitable for introduction into the United States. Studies regarding their life histories, ecological

requirements and host specificity will be undertaken. The stage in which they may most readily be shipped to the United States will be determined.

4.0203, STUDY OF THE USE OF INERT GASES TO ELIMINATE ACID POLLUTION FROM ABANDONED DEEP MINES

D.R. MANEVAL, State Dept. of Mines & Min., Harrisburg, Pennsylvania 17120

An abandoned drift mine of approximately 200 acres will be sealed, and air blowing and monitoring equipment installed. The air leak rate from the mine will be determined by correlating variable air input rates to the changes in the barometric pressures and temperatures in the mine. Later inert gases will be forced in the mine to displace the air and reduce acid mine drainage formation.

4.0204, EFFECT OF CONSERVATION PRACTICES ON HYDROLOGY AND SEDIMENTATION RATES

W.G. SHOPE, U.S. Dept. of Interior, Geological Survey, Harrisburg, Pennsylvania

This research is part of the program of water resources investigations conducted by the U.S. Geol. Survey in cooperation with the State of Pennsylvania.

The objective of this study is to evaluate the effects of changing land-use and agronomic practices on hydrology and sedimentation rates of two small watersheds in Pennsylvania. One watershed is undergoing land treatment at a moderate rate; therefore, a time control is being used. The other watershed is undergoing land treatment at an accelerated rate; therefore, an external control watershed is being used for comparison with the study area. Project started 1954 and will be completed 1968.

4.0206, STORM RUNOFF AND FLOOD FLOWS IN RELATION TO CLIMATIC AND WATERSHED CHARACTERISTICS

E.T. ENGMAN, Penn. State University, U.S.D.A. Ne. Watersh. Res. Ct., University Park, Pennsylvania 16802

Object: To identify the climatic and watershed factors affecting the volume, time distribution, magnitude, and frequency of storm runoff and flood flows and to evaluate these factors quantitatively as a basis for predicting storm runoff and floodflows from complex ungaged agricultural watersheds of the Northeast.

Plan of Work: The work is currently concentrated on the Sleepers River Experimental Watershed near Danville, Vermont; the Northeast Watershed Research Center, University Park, Pennsylvania, and on other agricultural watersheds in Virginia. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of the watersheds.

4.0207, FACTORS AFFECTING WATER YIELDS FROM SMALL WATERSHEDS AND SHALLOW GROUND AQUIFERS

R.V. ROMERO, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

1) Research work is proposed in order to correlate runoff rates and yields to watershed characteristic and climatic conditions.

Description of work: Topographic, soil and land capability maps will be made of the watershed area showing soil types, slopes, degree of erosion, drainage patterns, and ground surface configurations. Rain gages, HL flumes, and Bouyoucos resistance blocks will be installed in the area to measure rainfall, runoff rates, and soil water potential, respectively. Periodically, soil samples will be taken at different depths for soil moisture determinations. Isohyetal maps will be constructed for each storm and storm increments to determine the average rainfall in the watershed. Correlations will be made between runoff and soil moisture content, and between runoff and rainfall intensity.

4.0208, FACTORS AFFECTING WATER YIELDS FROM SMALL WATERSHEDS AND SHALLOW GROUND AQUIFERS

R. VAZQUEZ, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

Research work is proposed in order to correlate runoff rates and yields to watershed characteristic and climatic conditions in Lajas, Puerto Rico. The amount of runoff available for storage from small watersheds will also be determined.

Topographic, soil, and land capability maps will be made of the watershed area showing soil types, slopes, degree of erosion, drainage patterns, and ground surface configurations. Rain gages, HL flumes, and Bouyoucos resistance blocks will be installed in the areas to measure rainfall, runoff rates, and soil water potential, respectively. Periodically, soil samples will be taken at different depths for soil moisture determinations. The physical properties of the soils like field capacity, permanent wilting point, infiltration capacity, and water holding capacity will be determined. Isohyetal maps will be constructed for each storm increments to determine the average rainfall in the watershed. Correlations will be made between runoff and soil moisture content, and between runoff and rainfall intensity.

4.0209, DEVELOPMENT OF GROUND WATER CONTROL METHODS FOR THE HEAVY SOILS OF THE LAJAS VALLEY

R. VAZQUEZ, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

Research work is being conducted in Lajas Valley, Puerto Rico in order to study the ground-water hydrology of the Valley and the effectiveness of different methods of draining various soil types in the drainage-problem areas.

To study the ground-water hydrology a Valley-wide net of piezometers and water-table observation wells was established. With these data, ground-water contour maps will be drawn showing the direction of the horizontal and vertical hydraulic gradients. Periodical analyses and interpretation of the data will be done to diagnose problems in the Valley.

Existing or new wells will be pumped to study their effectiveness in intercepting the waters moving down the side slopes. Deep interceptor drains will be installed in similar areas to check their effectiveness in the interception of these waters. Free flowing (relief) wells will be tested in areas with high artesian pressures. The effectiveness of shallow tile and/or plastic drains, and open drains will be studied in areas where the soil conditions does not permit another type of drainage.

Due to the nature of these studies they will be continued for a long time. The project will be reviewed and revised every five years or in a shorter period if it is necessary.

Puerto Rico Government

4.0210, WATER REQUIREMENTS OF CROPS UNDER IRRIGATION IN LAJAS VALLEY, PUERTO RICO

R.R. VAZQUEZ, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

Two experiments will be conducted to determine the amount of irrigation water required for evapotranspiration and deep percolation in Lajas Valley soils. The moisture distribution in the soil profile, its yearly fluctuations, and its relation with the water-table also will be studied.

For that purpose an experiment of 16 plots, 8 of them planted with sugarcane and 8 left bare covered with plastics was established. Two different irrigation treatments will be applied.

To supplement the field data another experiment will be established in the present installation of lysimeter tanks to study the evapotranspiration of sugarcane under 2 irrigation and 2 nitrogen fertility levels.

4.0211, THE INFLUENCE OF WATER AND CLIMATE ON THE YIELD AND SUCROSE CONTENT OF SUGARCANE

M. CAPIEL, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

An intensified use of weather data will be made to modify field management practices throughout supplemental irrigation and harvest dates so as to be working with weather rather than against it.

The essential objective of this project is to consider the influence of micro-climate on the yield and sucrose content of sugarcane as it interacts with water added to the plant as rainfall and supplemental irrigation. Water will be supplemented to the plant on the basis of evaporative demands which, for practical purposes under low advective energy, may be considered to be integrated by pan evaporation. The effect of 'cut out' irrigation before harvest on the yield and sucrose content of the cane will be analyzed in connection with the climatic factors.

This experiment will be repeated once every 2 months for three consecutive times. It is expected that these seasonal plantings will provide for micro-climatic differences near planting and harvest dates which may help to evaluate the role of water and climate on the yield and sucrose content of sugarcane.

SUPPORTED BY Puerto Rico Government
University of Puerto Rico

4.0212, SILVICULTURE OF COASTAL PLAIN TIMBER TYPES

O.G. LANGDON, U.S. Dept. of Agriculture, Charleston, South Carolina

Object: To develop methods for management of Coastal Plain timber including loblolly pine, wetland hardwoods, and baldcypress from knowledge of how they regenerate, grow and respond to environment.

Plan of work: Studies on natural regeneration of loblolly pine will include: (1) relation of seed production to age, site, and density of stands; (2) effects of logging on soil and tree growth; (3) tests of the seed- and seedling-in-place concepts in mature and pulpwood sized stands. Studies on seeding and planting of loblolly will include: (1) effect of root malformation on growth; (2) seedling establishment under varying soil texture, soil moisture, sowing depths, etc. Studies on yield and quality of loblolly will include: (1) relation of growth to age, site and density; (2) effect of climate on growth; (3) effect of stand density on log quality; and (4) effects of competition on young stands. Stand improvement studies on loblolly will include: effects of burning on hardwood control and site productivity. Studies on wetland species will include: (1) effect of water level and soil on tree survival and growth; (2) relation of swamp environment to growth; (3) species-site interrelationships; (4) species reactions to flooding; (5) effects of tree and stand traits on seed production; and (6) relation of cutting methods to natural regeneration.

4. WATER QUANTITY MANAGEMENT AND CONTROL

SUPPORTED BY U.S. Dept. of Agriculture

4.0213, SOIL, PLANT, AND METEOROLOGICAL FACTORS IN DRAINAGE EVALUATION AND DESIGN

J.T. LIGON, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

Objectives: 1. To determine the frequency and duration of occurrences of prescribed drainage parameters on which crop response depends. 2. To determine the probability of being able to perform certain critical operations such as seedbed preparation, planting and harvesting of crops at optimum times. 3. To investigate techniques for more adequate evaluation of soil properties needed in the application of rational formulas to drainage system design.

A soil water balance will be used with soil, plant, and meteorological inputs to determine frequency and duration of drainage conditions unfavorable to plant development and agricultural operations. Limited field data will be taken to verify the models used. The four-well method for determining hydraulic conductivity will be investigated further along with other techniques for determining hydraulic conductivity and drainable porosity values useful in existing drainage design formulas.

South Carolina State Government

4.0214, WATER YIELDS FROM SHALLOW GROUND AQUIFERS

R.H. RAMSEY, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

OBJECTIVES: 1. To investigate methods of determining average soil permeability to depths of 30 feet in small areas where extreme variations are encountered. 2. To determine the most feasible methods of obtaining shallow ground water for irrigation and to correlate yields with site and climatic conditions.

DESCRIPTION OF WORK PROPOSED: Methods of determining the average permeability in shallow water bearing strata within small areas (1/8 to 1/2 acre) will be investigated and tested in both laboratory models and in natural field conditions. Different methods of obtaining shallow ground water for irrigation and other uses will be investigated and evaluated. Extent of area from which shallow ground water can be obtained will be studied, and water withdrawal-recharge relationships will be studied for areas investigated.

4.0215, VEGETATIVE SUCCESSION IN NEWLY CONTROLLED MARSHES

P.M. WILKINSON, State Wildlife Resources Dept., Columbia, South Carolina

Objectives: To determine plant succession in three newly developed 20 acre blocks of diked marsh in which all major conditions are nearly identical and in which the only variable will be water levels.

Procedure: Three 20 acre sections of formerly tidal marsh were recently diked. Each unit has a separate water control structure. A fourth unit, undiked, will serve as control. A schematic drawing of the layout is shown on reverse.

Unit 1 - Fill in spring. Maintain water at all seasons at 1'-2' depth above average ground level. Establish gage board. Surplus water will overflow at flash board. Permanent pool three years. Unit 2 - Maintain dry condition throughout spring and summer. Flood just prior to arrival of migrant waterfowl. Spring drawdown 1968 and repeat through 1969. Unit 3 - Spring drawdown to marsh ground level, keep bed wet. Flood just prior to average arrival of waterfowl.

Vegetation resulting in the three controlled compartments and in the uncontrolled check areas will be measured on established transects using the point contact method. Growth will be expressed both quantitatively and qualitatively. Transects will be run in September of each year and will continue for three successive years.

Subsidiary data to be collected include: 1. Biweekly salinity, all compartments and control. 2. Soil samples initial and quarterly (free analysis by Clemson University). 3. Hydrogen ion, potentiometer, biweekly.

4.0216, HYDROLOGICAL STUDIES OF THE SAVANNAH RIVER PLANT, SOUTH CAROLINA -GEOHYDROLOGY OF WASTE TANK FARMS

W.E. CLARK, U.S. Dept. of Interior, Water Resources Division, Columbia, South Carolina

Objective is to define in detail the geologic and hydrologic conditions in the vicinity of the tanks by drilling test holes, installing clusters of piezometers, and determining the permeability of the materials in the laboratory and from pumping tests. The validity of interpretations of flow conditions will be tested by constructing electric analog models and by digital computer analysis of the conceptual model. Tracer tests will also be designed to determine rates of flow.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

4.0217, DRAINAGE OF PROPOSED IRRIGATED SOILS IN OAAE UNIT

W.D. LEMBKE, South Dakota State University, Agricultural Experiment Sta., Brookings, South Dakota 57007

1. Determine the hydraulic conductivity of a soil using conventional methods and compare this with the hydraulic conductivity as determined from tile outflow. 2. Compare methods of predicting tile outflow with a falling water table and determine which is most applicable to Oahe Unit Soils. 3. Determine the drainage requirements of the soil with respect to the crops grown in this area.

Objectives one and two will be accomplished with field studies to observe actual flow from tile drains, with laboratory and field tests to measure hydraulic conductivity and by computing tile flow based on field and laboratory measurements.

Objective three will be accomplished by studying crop survival over a controlled water table.

South Dakota State Government

4.0218, IMPORTANCE OF TYPE 1 WETLAND COMMUNITIES TO WATERFOWL PRODUCTION

R.L. LINDER, State Dept. of Game Fish & Pks, Pierre, South Dakota

Objectives: 1. To evaluate breeding waterfowl use of habitat with high and low numbers of Type 1 wetlands. 2. To evaluate the roadside transect technique of censusing breeding waterfowl.

Procedures: 1. Two similar study areas of approximately 36 square miles will be selected. Each will have the same land-use type and contain comparable numbers of Types 3, 4 and 5 wetlands but differing numbers of Type 1 wetlands. 2. Two 20 mile transects will be set up in each of the study areas. 3. Frequent waterfowl counts will be made along each transect to determine waterfowl use of each wetland type and to obtain data for statistical analysis of the roadside transect technique. 4. Random sample plots will be selected throughout each area and intensive waterfowl counts made for comparison with roadside counts. 5. Surveys of land use, and changes cover types, vegetation phenology, water depths, area and perimeter, weather conditions, and human disturbance will be recorded. 6. After one year's data have been collected and analyzed, one additional study area of each type will be established for collection of data.

SUPPORTED BY U.S. Tennessee Valley Auth.

4.0220, NORTH FORK CITICO CREEK WATERSHED RESEARCH

P.C. SPATH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

Research established in 1960 cooperatively by TVA, U. S. Forest Service, and Tennessee State Game and Fish Commission in Cherokee National Forest to determine the effect of high-standard, multiple purpose forest management on watershed hydrology and stream biology. The well-managed, completely forested Appalachian Mountain watershed has an area of 7 square miles and ranges in elevation from 2000 to 5000 feet above sea level.

Hydrologic observations include precipitation, streamflow, air and water temperatures, relative humidity, and sediment. Forest, soil, and hydrologic condition surveys were made. Wildlife habitat surveys will be made and browse condition and trend or change in plant species composition observed. Stream biology investigations include sampling of bottom fauna, growth rate of wild rainbow trout, and determination of fish population.

The research involves two phases. The calibration phase involves the determination of the hydrologic characteristics of the watershed under existing conditions. The second phase, called the action phase, involves determining the changes in the hydrologic characteristics of the watershed caused by the construction of access roads to selected timber cutting areas and by the cutting and removal of timber in the selected areas. The calibration phase was completed in 1965. The action phase was begun in 1966 when construction was started on an access road to the first timber sales area. Construction of this access road was completed in 1967 and timber cutting began. A system of roads is being developed for timber harvesting operations and recreation.

SUPPORTED BY U.S. Tennessee Valley Auth.

4.0221, WHITE HOLLOW WATERSHED RESEARCH

P.C. SPATH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

Research started in 1935 on a watershed of 1715 acres to determine cover improvement influences upon hydrologic characteristics of small watersheds under a land-management system devoted primarily to watershed protection purposes. The watershed is located in the White Hollow portion of the White Creek basin in the Norris Reservoir area. It lies in the Appalachian Valley and Ridge Province of upper East Tennessee. The study is being carried on by TVA's Divisions of Water Control Planning and Forestry Development in cooperation with the State of Tennessee Division of Forestry and Fish and Game Commission.

Hydrologic observations include precipitation, streamflow and sediment. Air and water temperatures and relative humidity observations added in 1964.

The watershed was originally two-thirds poorly managed forest; the remainder largely abandoned land with a small amount of cultivation on the ridge tops or flatter slopes. Extensive erosion control operations were carried on in 1934 and 1935. Forest management was established in 1934-1935; reforestation of open areas was accomplished in 1938-1942. Beginning in 1966 the study entered another phase with the initiation of a selective timber-cutting program. Harvesting of most of the pulpwood was accomplished by the end of 1966. Three game pasture plots were established and logging roads seeded. The study is continuing to observe the effect upon runoff and erosion of the slowly changing condition of the forest cover. Saw timber harvesting is still in progress.

Analyses show (a) no appreciable change in annual water yield or evapotranspiration, (b) a sharp reduction in summer season peak discharges, (c) a 25-percent reduction in winter peak discharges, and (d) a reduction of over 95 percent in sediment loads.

A comprehensive report has been published entitled, 'Forest Cover Improvement Influence Upon Hydrologic Characteristics of White Hollow Watershed 1935-1958.' A paper entitled, 'Effects of Forest Cover Upon Hydrologic Characteristics of a Small Watershed in the Limestone Region of East Tennessee,' prepared by Paul C. Sodemann and Jones E. Tysinger, was presented at the

Symposium on Hydrology of Fractured Rocks at Belgrade, Yugoslavia, October 1965.

SUPPORTED BY U.S. Tennessee Valley Auth.

4.0222, BEECH RIVER WATERSHED PROJECT

P.C. SPATH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

The Beech River watershed project established in 1953 is a demonstration of intensified development of land-water resources integrated with the development of other resources of the area comprising 193,200 acres in Henderson and Decatur Counties in the western part of Tennessee. This project is being carried on in cooperation with the Beech River Watershed Development Authority and State of Tennessee.

Hydrologic measurements began in 1953, to ascertain the effects on the water resources of the watershed and its subdivisions resulting from changes in land cover, land-use management, and water management due to improvements in sound farming systems and the expansion and intensification of forestry programs. This included observations of precipitation, streamflow, both surface and ground water, and suspended sediment to serve as a base in evaluating the effects on hydrologic characteristics of changes in cover and land-use management.

The agricultural phase of the project is concerned with the improvement of land-use in sound farming systems.

The forestry phase is concerned with the expansion and intensification of forestry programs to increase both the resource base and the level of land resource utilization.

In December 1965 construction was completed of a multipurpose water control system for the Beech River watershed consisting of eight reservoirs and 80 miles of stream channel improvement. Hydrologic measurements are being continued to determine the hydraulic performance of the water control system, evaluate flood reductions, determine reservoir sedimentation and channel changes, and provide basic data for operation of the reservoirs.

SUPPORTED BY U.S. Tennessee Valley Auth.

4.0223, POND SEALING

J.I. SEWELL, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

Objectives: 1. Determine, by laboratory tests, the effects of selected treatments on the hydraulic conductivity of major Tennessee soils. 2. Determine relationships between hydraulic head and thickness of soil blanket necessary to prevent blowouts. 3. Determine, by field tests, the effects of the sealing techniques found to be most promising through laboratory studies.

Description work proposed: The changes in hydraulic conductivity brought about by various chemical and mechanical (compaction and puddling) treatments will be evaluated by permeameter tests. The adsorbed cations, cation exchange capacity, and per cent silt and clay will be determined so that the basic aspects of permeability alteration can be evaluated. Cylinders having perforated bottoms simulating porous parent material will be used to study relationships between thickness of soil blankets and blowouts. Field tests of the most effective sealing techniques will be made at the Middle Tennessee Experiment Station and at least one other location.

4.0224, FACTORS AFFECTING WATER YIELD FROM SMALL WATERSHEDS IN TENNESSEE

C.H. SHELTON, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

The objectives of the project are (1) to determine water yield of watersheds under specific soil and vegetative conditions, and (2) to correlate runoff rates and water yield of watersheds with such engineering practices as terracing, water impoundment and tillage.

During the years 1963-1966 a total of ten watersheds were developed on land representative of four of the six physiographic provinces of the state. Watershed sizes range from 11.4 acres to

4. WATER QUANTITY MANAGEMENT AND CONTROL

138 acres, with an average of 43 acres. Two of the watersheds are in woodland while eight are in pasture or cultivation. Watershed instrumentation includes rain gages, evaporation pans, pyrheliometer, hygromograph, access tubes for neutron soil moisture equipment, shallow ground water observation wells, and pre-calibrated stream gages with automatic float level recorders. Records are maintained relative to such items as topography, soils, and land-use practices.

Computer and statistical techniques have been developed for reduction and analysis of climatic and watershed data. Attempts are underway to numerically quantify parameters to facilitate computer analyses. To interpret data in terms of causative factors and to facilitate application of results to other areas, procedures of data collecting, processing, evaluating and reporting are coordinated with participating states and agencies in Regional Project S-52. As the element of time becomes sufficiently long to adequately sample the hydrologic response of the watersheds under various conditions, it is anticipated that findings will have their greatest application in determining criteria for (1) watershed management resulting in optimum time-distribution, predictability and efficient use of water supply, and (2) hydraulic design of water control structures.

University of Tennessee

4.0225, FACTORS AFFECTING WATER YIELDS FROM SMALL WATERSHEDS IN TENNESSEE

C.H. SHELTON, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

Factors affecting water yields from small watersheds in Tennessee Objectives: 1. Determine water yield of watersheds under specific soil and vegetative conditions. 2. Correlate runoff rates and water yields of watersheds with such engineering practices as terracing, water impoundment, and tillage. Description of work proposed -- Initially, two watersheds having an area in the range of 10 to 300 acres and adaptable to necessary measurements and control for hydrologic studies will be selected. If additional pairs of watersheds can be found in areas representing different physiographic conditions, they will be developed later. The watersheds will be appropriately instrumented and uniform vegetative cover will be established. After having collected sufficient data to satisfy Objective (1) a series of suitable engineering practices for each watershed will be established and studied in sequence. The experiment will be so designed that the data may be statistically analyzed and be correlated with other participating states in S-24 with respect to such items as watershed characterization, principal measurements, and data processing.

4.0226, WATERSHED EVALUATION

J.M. STUBBS, State Game & Fish Commission, Nashville, Tennessee 37203

OBJECTIVES: The major objective is to show what effects watershed impoundments, stream snagging, clearing, and channel excavation have on fish populations and water quality. The following data will be collected under each phase. (a) Complete population samples will be taken to evaluate the standing fish population. (b) Bottom fauna studies to evaluate benthic populations. (c) Temperature studies to measure the effects of the impoundments on stream temperatures. (d) General sport creel survey to measure fishing pressure and use. (e) A complete water chemistry study to analyze present water quality.

PROCEDURES: Three collecting stations are set up on Hurricane Creek and one of the major tributary streams (Little Hurricane Creek). Each station consists of at least a one-fourth mile sample section, and the fish population will be estimated by the mark-and-recovery method. The study will be carried out during the summer and fall months. Electro-fishing will be employed as the collecting method.

Quantitative and qualitative benthos samples will be taken at each of the four selected stations, and will be identified to family, and in some cases to Genus. The samples will be taken at least twice, once in the summer and once in the fall during the study

period. Samples will be collected with a Surber sampler; identification will be carried out in the spring and winter months.

Three water temperature stations are set up on Hurricane Creek to measure the warming effects of the impoundments. The thermometers will be read and remain in the stream during the summer and fall months. Weather conditions the day before and condition of the water (turbid, clear, etc.) will be noted and recorded.

A complete water chemistry analysis will be collected on the stream at two stations. One sample will be collected in the fall and one in the spring.

A general sport creel survey will be taken by the local Game and Fish Officer. The purpose of a partial creel survey is to get a general idea of how many people are utilizing the creek for fishing purposes, species caught, and catch rate.

4.0227, AN HISTORICAL APPRAISAL OF THE TENNESSEE VALLEY AUTHORITY'S FLOOD CONTROL PROJECT AND PROGRAM

W.H. DROZE, Univ. of Texas, Graduate School, Arlington, Texas 76010

This proposal entails the examination of flood literature, observation of flood prevention works, analysis of flood damage records, and the study of flood-proofing efforts for the purpose of determining the effectiveness of the Tennessee Valley Authority as a flood control agency. This study will include an analysis of the politics of flood control planning and development, an assessment of the engineering scheme which was used to remake the river, an examination of the efforts to control water on the land, an economic judgment of the costs and benefits of the water control system, and a comparative appraisal of the political and economic feasibility of applying the valley-authority type of agency to flood problems on other rivers.

Historical methods will be used to obtain and analyze the data about the Tennessee Valley Authority's project and program. Private and public and published and unpublished documents will be studied to determine why and how the TVA's flood control system was developed. On-the-ground observations will be conducted during the rainfall season in the Valley for determining the effectiveness of the system. Documentary information and field observations will be checked for their accuracy. Assembled data will be organized and reported according to standard historical procedures.

4.0228, WATER LOSS

C.D. STUTZENBAKER, State Parks & Wildlife Dept., Austin, Texas

Procedures: Record weekly water levels in relation to rainfall and input-output flooding. Evaluate net water levels in relation to wind, temperature, humidity, water depth and vegetative condition to determine normal water loss factor for each compartment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Texas State Government

4.0229, STABILIZATION STUDY OF FALCON RESERVOIR

J.M. TRAVIS, State Parks & Wildlife Dept., Austin, Texas

P. P. S. Objective: To conduct a study of the effects of a stabilized water level on sport fishing, fish populations, and the physical, chemical, and biological properties of Falcon Reservoir.

Procedures: 1. Fish populations will be sampled bimonthly with experimental gill nets and seines. Nets will be set at 12 predetermined stations for a period of time ranging from 8-18 hours. Netting stations will be located in approximately the same positions as those used during a previous survey of Falcon Lake. Seine collections will be taken at four or five established stations. Data collected from specimens taken by net will include length, weight, and sexual development. Stomach contents will be examined for a set number of each species. Seining collections will be preserved and returned to the laboratory for identification.

4. WATER QUANTITY MANAGEMENT AND CONTROL

2. An attempt will be made to observe, detect, and record any physical, chemical and biological conditions that could affect the ecology and fish population of the lake. Chemical analysis of the lake water will be run bimonthly at selected sites. Water analysis data will include dissolved oxygen, dissolved carbon dioxide, alkalinity, pH, air and water temperatures, chlorinity, and turbidity. Records will be kept of the water level in the lake and of any changes which occur. Past water level records will be obtained for reference.

3. A study will be made of creel census methods and the suitability of Falcon Lake for creel census work.

4. The relative abundance of game and rough fishes will be determined from data collected. Year class strengths will be approximated by length-frequency methods.

4.0230, SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE

W.L. MEIER, State Water Development Board, Austin, Texas 78711

The objective of this year's research project will be the development of techniques useful in defining the least costly means of supplying municipal, industrial, irrigational, recreational, fish and wildlife, and secondary petroleum recovery water requirements for a selected portion of the proposed Texas Water System to the year 2020. A methodology will be sought to aid planners in decision-making regarding means of providing water at least cost to meet demands among the several source river basins and reservoirs, and along the route of conveyance to terminal storage within the constraints of prospective water sales contracts, alternative project feature sizing, and alternative sequences and timing of construction of project elements.

Specifically, this research will have as its goal the development of the following: (1) a transfer model for optimal allocation of water to meet specified demands to the year 2020 at minimum total cost within the prescribed legal, financial, contractual, and political constraints, (2) an optimal means of sizing, sequencing and timing of the addition of project elements, (3) simulation models for the system, and (4) a support Data Management System.

4.0231, EVALUATION OF HYDROLOGIC EFFECTS OF URBANIZATION

W.H. ESPY, Tracor Incorporated, Austin, Texas 78721

The objective of this research project is to evaluate and extend previous studies to determine the effects of urbanization on several small watersheds located in Houston, Texas. Equations have been derived which evaluate certain hydrologic characteristics under past rural or undeveloped conditions and predict these same characteristics under future urban conditions for a small urban watershed at Austin, Texas. It is proposed to evaluate the applicability to other watersheds of these equations by comparison with historical data from twenty small gaged watersheds in Houston, Texas.

Unit hydrographs having a common time base will be derived for all twenty watersheds with the data used to derive the original equations, and by a multiple linear regression analysis generate modified equations having possibly broader application.

4.0232, FLOOD INUNDATION MAPPING AND URBAN RUNOFF INV., DALLAS, TEXAS

G.R. DEMPSTER, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

Purpose: To define in Five Mile, Cedar, and Coombs Creek watersheds which would be inundated by past floods of defined frequency. To collect basic hydrologic data on floods of greater-than-ordinary magnitude in these watersheds and White Rock, Barkman, and Joes watersheds. To determine the effects of urban development on flood flows and total runoff in the White Rock Creek area.

Methods: The three major objectives of this project are inter-related to the extent that all hydrologic data collected will be applicable to each objective. Hydrologic instruments and surveys associated with the long-range program will provide the necessary data to define areas inundated by specific floods and to evaluate the effects of urban development on runoff. The data, analyses and computation associated with the short-term phase of the project to provide interpretive information on areas which would be inundated by floods of selected frequency will be applicable to the other objectives and would be strengthened and substantiated by data collected on floods experienced in the watershed. The data collected on the partly urbanized White Rock Creek watershed will be integrated with that being collected on the adjoining but mostly urbanized Barkman Branch and Joes Creek watersheds and the completely urbanized Turtle Creek watershed for analysis.

4.0233, HYDROLOGIC INVESTIGATIONS OF URBAN AREAS - HOUSTON, TEXAS

S.L. JOHNSON, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in Cooperation with State and local agencies in Texas.

Purpose: To determine the changes in magnitude of flood flow and runoff caused by urbanization at a selected number of stream-gaging sites within the Houston area.

Methods: A continuous record of rainfall and runoff will be obtained at 7 stations in the hydrologic data collection network. Flood-hydrograph partial-record stations will be maintained at 15 sites. In addition, 6 rain gages will be located in the area. The stations were selected to provide optimum sampling of flood discharge with respect to time, variations in rainfall through climatic cycles, size of area, and degree of urbanization of area.

Texas State Government

4.0234, URBAN HYDROLOGY STUDY - SAN ANTONIO, TEXAS

E.E. SCHROEDER, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Texas.

Purpose: To provide data for a logical approach to flood-zoning and flood-protection problems, and to analyze the effects of progressive urbanization on the runoff. Data will also be useful in design of storm sewers, culverts, and bridges.

Methods: An adequate sampling will be made of data with respect to flood discharge as affected by time, variations in rainfall through climatic cycles, size of area, and degree of urbanization of area. This sampling will be accomplished by installation of streamflow stations, crest-stage stations, and rain gages at appropriate locations. The instrumentation will be done on pairs of small drainage basins within the metropolitan area. One basin of a pair will be chosen to represent urbanized conditions; the other will represent the undeveloped conditions. In so far as possible, the pairs of basins will be chosen so that the other factors such as geology, topography, and size will be equal.

4.0235, GEOLOGY OF THE PALUXY AND BRAZOS VALLEYS IN HOOD, SOMERVELL, AND ERATH COUNTIES, TEXAS

J.S. NAGLE, Univ. of Texas, Bureau of Economic Geology, Austin, Texas 78712

Research leading to preparation of the ground-water section of this study documents a history of water use, gives an evaluation of present status of ground water resources, and presents an estimate of reserves in the confined Trinity aquifers of the area. His-

4. WATER QUANTITY MANAGEMENT AND CONTROL

tory of water withdrawal and use was gained from a literature survey. The area was historically famous for flowing artesian wells, described in detail by R. T. Hill in 1901. By 1934 (Fiedler, U. S. Geological Survey Water-Supply Paper) water levels had declined to the point that most wells had stopped flowing. Estimates of water use for 1901 to 1934 indicate at least as much water was wasted as was used. Continuing studies by the U. S. Geological Survey have provided data since 1934. Analysis of the stratigraphy of the Trinity sands enables one to determine which sands are isolated from recharge areas, and which are continuous to outcrop. From these data, as well as from pumpage and water level data, it was possible to estimate water reserves in isolated sands, and to estimate the maximum pumpage that could be maintained to develop a balance between recharge and withdrawal in areas of continuous aquifers. An areal geologic map will be included in the report.

4.0236, DEVELOPMENT OF A CHEMICAL FALLOW SYSTEM OF FARMING

A.F. WIESE, Texas A & M University System, Agricultural Experiment Sta., Bushland, Texas

Objectives: 1. Determine the effect of chemical fallow during a wheat-sorghum-fallow rotation of runoff, soil losses, moisture storage, residue conservation, crop yields and other physical, microbiological and chemical properties of Pullman silty clay loam soil. 2. Determine factors which may enhance the effectiveness of herbicides on grass weeds under semi-arid conditions and evaluate new herbicides for controlling weeds in continuous sorghum, continuous wheat, wheat-fallow, and wheat-sorghum-fallow rotations. 3. Determine the effect of herbicidal treatment on the water use and weed growth.

Work Proposed: A long term experiment will be conducted to determine the effect of chemical fallow on soil moisture runoff, crop yield and various physical, chemical and microbiological properties of the soil. Studies will be conducted to locate herbicides for chemical fallow in various cropping systems. Studies will also be conducted to determine factors which will enhance the effectiveness of herbicide to grass weeds under semi-arid conditions.

4.0237, FACILITIES AND PROCEDURES FOR CONSERVATION MANAGEMENT OF RUNOFF WATER FROM AGRICULTURAL LANDS IN THE SOUTHERN PLAINS

V.L. HAUSER, U.S. Dept. of Agriculture, Bushland, Texas

Object: To develop and evaluate new and improved facilities, procedures, systems, and design criteria for the efficient collection, conveyance and surface or subsurface storage of runoff water for beneficial use from both dry and irrigated lands.

Plan of Work: Engineering studies will be made of systems, structures, and procedures for conserving runoff water that accumulates in playa lakes or constructed reservoirs. The research will include, but not be limited to, the following: clarification of muddy lake water, detailed exploration of the soils and materials existing in, under and around playa lakes, reservoir construction to concentrate runoff water, construction of water-spreading systems, construction of simple and cheap recharge shafts or wells, study of rate and direction of movement of recharged ground water, and other approaches as recognized worthy of study. Engineering studies will be made of terraces and other structures built to manage runoff water for either storage in the soil or removing it from the field as the crop and soil condition may dictate. Systems studied will include: Zingg conservation bench and other water conservation type terraces, land leveling, water spreading, and waterways lined with vegetation or permanent lining materials.

Cooperation: Kansas, Oklahoma, and Texas Agricultural Experiment Stations; SCS; and soil and water conservation districts.

4.0238, IMPROVED DRAINAGE SYSTEMS DESIGN, MATERIALS, INSTALLATION TECHNIQUES & DRAINAGE REQUIREMENTS OF CROPS IN THE SOUTHERN PLAINS

V.L. HAUSER, U.S. Dept. of Agriculture, Bushland, Texas

Object: To develop basic equations describing water flow relationships in drainage systems; to develop and evaluate design procedures for surface and subsurface systems, singularly and in combination; to evaluate new tubing, bedding, and envelope materials, and installation techniques; to determine causes for decrease in effectiveness of installed drainage systems; and to determine drainage requirements of crops and soils in the Southern Plains.

Plan of Work: This work will be conducted in the laboratory under controlled conditions and in the field. These studies will seek to develop criteria and test new materials for farm drains and for filters and envelopes around drains. Field evaluations of old drainage systems will be made to determine the long-range effectiveness and durability of drain and filter materials. Model studies will be made to develop flow equations directly or to determine the accuracy of equations developed with computer techniques. Laboratory models, analog studies, and hydraulic tanks will be used to study special drainage problems that are difficult to evaluate under field conditions. High speed digital computers will be used to provide tabular material or basic nomograph data which can greatly simplify the design of drainage systems using improved flow equations that consider the heterogeneous conditions of most soil. Results of these studies should provide improved design criteria and formulae for computing drain spacing and depth. The development of new equipment and materials for tile drainage installations will be carried on cooperatively with drainage contractors and drainage material manufacturers.

Cooperation: Texas Agricultural Experiment Station; SCS; U. S. Bureau of Reclamation; soil conservation districts; State engineers; irrigation districts, and private agencies.

4.0239, EFFECT OF SURFACE IRRIGATION HYDRAULICS ON EFFICIENT APPLICATION OF WATER

L.J. GLASS, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

1. Determine the effect of irrigation stream size, slope and shape of irrigated surface, hydraulic roughness of irrigated surface and water intake characteristics of soil on system design for most efficient application of water by surface irrigation methods. 2. Correlate results into design procedures using hydraulic factors of surface irrigation flow as criteria for design.

DESCRIPTION OF WORK - The research will be conducted in two phases. One phase will include a laboratory investigation of the problem while the other will incorporate field work.

The laboratory work will include tests in a hydraulic flume to determine (1) the shape of the water surface profile of the advancing and receding free water surfaces; (2) the type of flow (laminar or turbulent) as related to conveyance surface roughness characteristics, fluid properties, and hydraulic aspects of flow such as depth of flow and channel shape; and (3) the cross-sectional shape of conveyance surface and its effect on flow.

The field work will be directed toward checking hypotheses considered logical and necessary from the laboratory phases of the study.

4.0240, CONTAMINATION OF GROUND WATER FROM RADIOACTIVE PACKAGES IMPACTING ON LAND

M.C. SCHROEDER, Texas A & M University System, Graduate School, College Station, Texas 77843

The dispersal of radioactivity by the accidental impact on the land of an apparatus carrying radioactive materials will be in part into the ground. This then can be transported by runoff or percolating water to streams or to the ground-water body. The possi-

4. WATER QUANTITY MANAGEMENT AND CONTROL

ble methods of transport are controlled by the distribution coefficient of the released radioisotopes for the earth materials and the transporting waters. The stability of the original radioactive compounds may also need to be determined. Measurements of distribution coefficients for various materials under several chemical conditions will be made. These and published measurements will be evaluated in terms of transport for a number of conditions of soil, precipitation, types of weathering, vadose-water percolation, aquifer materials, transporting waters and other pertinent conditions. Consideration must be given to the dependence of the distribution coefficient upon the concentration of the radioisotopes. This research under the supervision of Melvin C. Schroeder is an extension of similar studies he made for Lawrence Radiation Laboratory, Livermore, California. That study was concerned with the ground-water transport of radioactivity from the site of subsurface nuclear explosions.

4.0241, ECONOMIC ANALYSIS OF SMALL WATERSHED DEVELOPMENT IN TEXAS.

W.L. TROCK, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

1. To determine the economic impact of watershed development on farms, communities and towns in selected small watersheds in Texas. 2. To evaluate developments via cost-benefit analysis of completed projects. 3. To examine alternatives to present watershed developments.

Description of work proposed: A description of each watershed prior to development will be prepared. Then the structural works of the developments will be identified and the costs associated with these works determined. Other costs, as waiting costs, will also be identified and evaluated. The benefits realized from developments will be determined and cost-benefit analyses of the completed developments will be accomplished. Realized benefits of development will be compared with benefits estimated in the project plans as a check on planning methods and procedures. Finally, possible alternatives to the developments now complete will be evaluated via synthesis of developments which would incorporate these alternatives. Added information useful in planning will thus be produced.

4.0242, A MODEL RELATING WATER QUALITY VEGETATIONAL STRUCTURE AND URBANIZATION IN THE SAN JACINTO RIVER BASIN

D.L. JAMESON, Univ. of Houston, Graduate School, Houston, Texas 77004

We propose to analyze the correlation between vegetational structure, amount and kind of land utilization urbanization and the chemical and biological measures of water quality in the San Jacinto River Basin, Texas. The initial parameters will be obtained from government documents, reports already available or currently obtained (weather and hydrographic stations). These measures are assumed to be available to any metropolitan region which should give the model structural generality. Principal component analysis will be used for data reduction. Canonical correlation analysis will be used to obtain a preliminary estimate of the significant parameters. Multiple discriminant analysis will be used to identify the significant variables correlated with specific water quality stations. The data from these analyses will be used to construct a model which will characterize the present situation. The parameters of this model will then be manipulated with simulation programs in computers to attempt to predict the course and nature of water quality changes during the continued expansion of urbanization in the vicinity of Houston, Texas.

4.0243, DEVELOPMENT OF SYSTEMS FOR GROUND WATER RECHARGE INTO THE OGALLALA FORMATION

M.J. DVORACEK, Texas Technological College, School of Agriculture, Lubbock, Texas 79409

The work proposed in this project is to develop systems for recharging underground formations. Several approaches - well, pit, basin, shaft, & trench recharge plus water spreading - will be investigated. Particular consideration will be given toward development of a filter or clarification system for removal of the high sediment load carried by waters used for recharge. Waters available for recharge are generally excess water such as surface runoff collecting in natural depressions (playas).

Investigation will include both field and laboratory installations of filter systems suitable for clarification of waters for both pit and well recharge. Pit, shaft, & trench recharge and water spreading will be primarily field evaluations of constructed recharge facilities. The establishment of design criteria for pits, shafts, & trenches and filters for clarification of water is the primary objective of the project.

4.0244, INTER-BASIN DIVERSION OF WATER - A TEXAS CASE STUDY

H.W. GRUBB, Texas Technological College, School of Agriculture, Lubbock, Texas 79409

Specific Aims and Expected Results: The study will seek to illuminate the issues involved in large-scale water diversions and improve the analytical methodology for dealing with them. The specific problems to be dealt with are as follows: (1) The evaluation of benefits from a new water supply which is large enough to affect substantially the overall economy of a region. (2) The development of appropriate pricing policies where more water will help rescue an agricultural area from decline due to depletion of water supplies. Under these circumstances the water users may not be able to afford to pay the full cost of the supply although the project as a whole may be justified because of the overall benefits to the region and the nation. Various techniques for financing projects under these conditions merit exploration. (3) The economic consequences of legal restrictions on water transfer. It is evident that the laws which protect the area of origin against transfers of water to other areas seriously limit the opportunity for making the most economic investments in water development. The study will endeavor to illustrate the significance of these costs by evaluating them in the Texas situation. (4) The optimal staging of diversion works. The study will consider alternative ways of staging the development so as to relate investment in increased supply to the demand outlook. For example, consideration would be given to the possibility of developing closer sources initially pending an increase in demand to justify the construction of larger facilities bringing water from greater distance to serve long-range future needs. It is anticipated that the study will produce a major monograph on the economics of interbasin diversions of water.

4.0245, EFFECT OF UNLINED TREATED SEWAGE STORAGE PONDS ON WATER QUALITY IN THE OGALLALA FORMATION

D.M. WELLS, Texas Technological College, Water Resources Center, Lubbock, Texas 79409

Treated effluent from approximately eighty municipalities located in the high plains of Texas is presently being stored in unlined ponds and used for irrigation of crops. This project is designed to determine the effect of such surface stored on groundwater quality in the underlying Ogallala formation.

A pond has recently been constructed for storing municipal effluent on the Texas Tech campus. Two wells will be drilled, cased, and equipped with electric pumps in the vicinity of this pond. One well will be located adjacent to the pond, and the other several hundred feet downstream. Samples will be collected weekly from these wells and from several other existing wells located in various distances around the pond. Weekly samples will also be collected from three or four points within the pond.

All samples collected will be analyzed for total nitrogen, total phosphorus, chlorides, and total dissolved solids. Changes in groundwater quality will be observed and quantitative estimates of the rate in which sewage percolates into the groundwater will be made by determining the rate and the extent of propagation of quality change from the test well adjacent to the storage pond.

4.0246, MATHEMATICAL MANAGEMENT MODEL UN- CONFINED AQUIFER

D.M. WELLS, Texas Technological College, Water Resources
Center, Lubbock, Texas 79409

This research will investigate the application of existing techniques to the development of a mathematical model describing the flow of water in the Ogallala (and similar) aquifers, and, as necessary, the development of new or improved methods for mathematical modeling of an aquifer, with the end objective of achieving a tool to be used in managing the operation of the aquifer.

Coding procedures for computerizing well data will be developed and an approach to calculating pumpage will be devised. This information will be related to existing maps depicting hydrologic conditions in the H.P.U.G.W.C.D. No. 1.

Mathematical modeling methods for the Ogallala aquifer will be developed, starting with existing modeling techniques, with development of new and improved methods as necessary. Technical assistance and consulting from General Electric, TEMPO, and their work in developing techniques for deducing values for storage factor and transmissibility, will be utilized.

The model developed will be tested, to some extent, on parts of the Ogallala aquifer.

4.0247, DEVELOPMENT OF SYSTEMS FOR GROUND WATER RECHARGE INTO THE OGALLALA FORMATION

R.Z. WHEATON, Texas Technological College, School of
Agriculture, Lubbock, Texas 79409

The work proposed in this project is to develop systems for recharging underground formations. Two (2) approaches--well recharge and pit or basin recharge--will be investigated. Particular consideration will be given to development of a filter for the clarification of waters carrying a high sediment load. Waters available for recharge are generally excess water such as surface runoff which has a characteristic high sediment load. These conditions are severe and any filter developed should function in other areas. Investigation will include both field and laboratory installations using various filter materials. Pit recharge studies will be primarily field evaluations of constructed pits, at least ten (10) foot in depth, with various side slopes. Pits are to be located in natural depressions, (playas) using primarily surface runoff water for recharge with sewage effluent as a secondary source. The establishment of design criteria for pits and filters for recharge wells is the primary objective of the project. The project was started in 1966 and anticipated completion date will be 5 years.

4.0248, RELATION OF CLIMATIC AND WATERSHED FACTORS TO STORM RUNOFF IN THE SOUTHERN PLAINS

R.W. BAIRD, U.S. Dept. of Agriculture, Temple, Texas

Object: To identify the climatic and watershed factors influencing the magnitude and frequency of storm flows from agricultural watersheds; to evaluate the factors quantitatively; and to develop procedures by which the magnitude and frequency of storm flows from ungaged watersheds may be estimated.

Plan of Work: The work is currently concentrated on a segment of the Washita River Watershed in the vicinity of Chickasha, Oklahoma; on small agricultural watersheds near Stillwater, Oklahoma; at the Blacklands Experimental Watershed, Riesel, Texas; and on Lowrey Draw at Sonora, Texas. Some of the factors required by the analyses and which are measured or otherwise documented for the study are: rates and duration of stream-flow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape

and other geomorphic attributes of the watersheds. The downstream effect on flow regimes associated with improvement works in upstream tributaries is a primary phase of the study on the Washita River Watershed.

4.0249, WATER YIELD IMPROVEMENT FROM SOIL TREATMENTS AND PLANT-COVER ALTERATIONS (AB- BREV)

N.V. DEBYLE, U.S. Dept. of Agriculture, Logan, Utah

Object: To determine the vegetative characteristics and processes that influence effects of plant-cover alterations and soil treatments on water yield.

Plan of work: The project staff is inventorying the following resources of the Intermountain Region that affect water yield: precipitation zones, vegetative types, soil types, and available water supplies. They are determining the hydrologic processes and relationships between soils, plants, and water that are involved in water yield. This information will be applied to plot studies to provide preliminary information the effect of watershed treatments such as vegetative thinning, removal, and conversion to other types; prescribed burning; and methods of cutting. Finally, they will apply the most promising of these treatments to pilot watersheds for verification.

SUPPORTED BY U.S. Dept. of Agriculture

4.0250, WATERSHED PROTECTION & REHABILITA- TION TO REDUCE WATER RUNOFF

P.E. PACKER, U.S. Dept. of Agriculture, Logan, Utah

Object: To study the relation of soil, water and vegetation to water infiltration, flow, and erosion; flood and erosion hazard criteria and protection for high-elevation summer ranges; effects of various rehabilitation treatments and management practices on erosion and on flood potential; and methods to restore plant cover, soil stability, and infiltration on depleted watersheds.

Plan of work: The project staff is investigating storm patterns to determine maximum rainfall intensity and level of protection needed. They are identifying the soil and vegetational characteristics that affect infiltration, overland and subsurface flow, erosion, and those factors that limit plant cover on harsh sites. They are developing and evaluating (1) treatments to improve the limiting site factors and (2) engineering structures to prevent overland flow. Pilot watersheds have been calibrated to test rehabilitation measures and improved grazing practices.

4.0251, THE DRAINAGE OF IRRIGATED LANDS

A.A. BISHOP, Utah State University, Agricultural Experiment
Sta., Logan, Utah 84321

Objectives: 1. To determine the influence of irrigation methods and practices on ground water levels and drainage requirements. 2. To develop methods for evaluating the natural sub-surface drainage potential of an irrigated area. 3. To determine the relation between the soil permeability, as measured by the auger hole method, and the rate of fall of the water table mound with different irrigation applications.

The work proposed consists of establishing a two dimensional, steady state, flow system in a natural soil and evaluating the natural drainage potential from measurements of the total flow, piezometric head, soil moisture tension, permeability, and water table conditions. Data for the non-steady flow condition will also be obtained.

4.0252, HYDRAULICS OF SURFACE IRRIGATION

A.A. BISHOP, Utah State University, Agricultural Experiment
Sta., Logan, Utah 84321

Objectives: To provide understanding of surface irrigation design through the investigation of the hydraulic characteristics of surface flow: 1. By further development of mathematical

4. WATER QUANTITY MANAGEMENT AND CONTROL

models describing the flow in terms of the many variables involved including appropriate testing under controlled conditions. 2. By laboratory experiments for the description and evaluation of component variables. 3. By field trials to test the validity of mathematical equations and laboratory relationships in 1 and 2 above.

Work Proposed: Refinement of the mathematical model which describes the advance of water over the soil surface will be continued. Simplification of certain assumptions employed in the development of the existing mathematical models for recession and improvement of models for application efficiency and distribution efficiency. Field trials will also be conducted to test the models proposed.

SUPPORTED BY U.S. Dept. of Agriculture
Utah State Government

4.0253, DESIGN OF OPEN CHANNELS TO PREVENT BANK FAILURE

A.A. BISHOP, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objective: To analyze and describe the sub-surface flow of water and those factors which affect it (such as the physical and chemical properties of air, water, soil and introduced materials) in the immediate vicinity of the drain facility (tile line, ditch, drain well, etc.) in order to prepare improved criteria and procedures for design, installation and operation of drains.

Work Proposed: A field plot adjacent to an open drain will be constructed such that the water table a short distance from the drain can be controlled at the desired level. Plastic liners will be placed in a trench around three sides of a short section of drain bank. Water introduced on one side of the plot would move toward the drain simulating field conditions. The flow patterns established and the height of the seepage face will be determined by piezometric measurements. The strength of the soil will be measured and used to predict failure conditions. The strength of the soil as influenced by the absorbed ions will also be studied.

4.0256, THE ROLE OF VEGETATION AND SOIL IN WATERSHED YIELD

B.L. GROVER, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives and Description of Work - 1. To develop a water yield prediction equation based on probable precipitation, soil properties, plant characteristics, and expected evapotranspiration for a particular watershed unit. 2. To determine the water balance of specific watershed units to test the equation developed in Objective 1. This is to be done using data on climate and site characteristics obtained from sites selected for specific combinations of vegetation and soil types. 3. To determine the effects of site factors upon the dendrochronological record produced. It is proposed to develop a chronology for the Ephraim Canyon area from suitable cores and cross sections and compare these with climatic records of particular watersheds. 4. To determine recent changes in the extent of Gambel oak and aspen clones by use of ring dating of cross sections from selected 'trunks' from typical clones.

4.0257, ECOLOGICAL STUDIES OF MANIPULATED MARSHES AT DELTA, MANITOBA, CANADA

D. MOORE, Utah State University, State Coop. Wildlife Res. Unit, Logan, Utah 84321

This study is designed to quantitatively elucidate many of the ecological differences which may arise in marshes having different water depths. Waterfowl will utilize these different water depth marshes in varying degrees. On the basis of the measured ecological differences of these marshes, recommendations will be made for future water level management.

An area within the private marshes of J. P. Bell, approximately 200 acres in size, roughly triangular in shape, and five miles east of the Delta Station was chosen for the proposed study.

The study marsh is now divided, by dikes, into five adjoining units. Two of these units are 47 acres in size; three are 33 acres in size. All units are connected by culverts enabling water level manipulations to be executed independently of the water level fluctuations of the main marsh. Water depths of 0, 12, 18, 24 inches and an uncontrolled area outside will be used.

To determine the differences in emergent and submersed vegetation within the different, but constant, water depth impoundments and within a section of uncontrolled marsh the procedure will follow along two major lines of investigation: (1) the vegetation will be measured qualitatively and quantitatively employing recognized and standardized procedures and (2) ecological factors within the impoundments and the uncontrolled area which relate to the vegetation will be measured.

4.0258, COMPUTER SIMULATION OF URBAN HYDROLOGIC SYSTEMS

J.P. RILEY, Utah State University, Utah Ctr. For Water Resour., Logan, Utah 84321

This study represents a logical extension of the work performed under a previous project (B-016-Utah). Under the previous work urbanization factors were expressed as parameters that define a equivalent rural watershed in a lumped system. In this study the urbanization factors were accounted for by analyzing each unit of the watershed. It is anticipated that the results of this study will be useful in the design of drainage structures on an urban micro-watershed basis.

The study will include classification of the urban watershed into a number of homogenous subunits. One or two blocks from each subunit will then be analyzed in detail. An attempt will be made to apply the equations of gradually varied, unsteady flow in open channels to describe the mechanics of runoff. The computed total outflow hydrographs will be compared with both measured hydrographs and those obtained from other methods.

4. WATER QUANTITY MANAGEMENT AND CONTROL

Simulation models will be tested and verified on the analog computer. Field data will be obtained from the Waller Creek watershed at Austin, Texas.

4.0259, MANIPULATION OF TREMBLING ASPEN AND GAMBEL OAK FOR INCREASED WATER YIELD

J.D. SCHULTZ, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: 1. To determine effective means of obtaining prescribed degrees of eradication of trembling aspen and Gambel oak growing on soils varying in texture from silts to clays and from sands to loams. 2. To evaluate relative gross savings in water loss by eradicating trembling aspen and Gambel oak to different levels. 3. To evaluate patterns of vegetation manipulation in the aspen type on snow accumulation and snowmelt.

Procedures: 1. Seven eradication treatments, replicated twice on each of four sites in continuous stands of both aspen and oakbrush, will be applied as follows: clearcut, intermediate cuttings of 75, 50, and 25 percent basal area, metered poison injections of every tree on a plot, frustum-reservoir poison injections of plot trees, and no treatment. Sprouting to be used as criteria of success. 2. Neutron meter access tubes to be installed to six to ten feet deep on the same plots, representing four vegetation conditions at each site: untreated stand, clearcut stand, stand poisoned by frustum-reservoir method, and stand with 75 percent basal area removed. Soil moisture losses over growing seasons to be measured. 3. Snow courses to be located in aspen stands with clearcut patches and strips to provide data on accumulation and melt.

SUPPORTED BY U.S. Dept. of Agriculture

4.0260, ANALYSIS OF SMALL WATER MANAGEMENT STRUCTURES

G.V. SKOGERBOE, Utah State University, Utah Ctr. For Water Resour., Logan, Utah 84321

The Irrigation and Drainage Research Conference conducted at Utah State University in March 1964, delineated many of the research needs regarding 'Small, Low-Cost Hydraulic Structures for Conveyance and Distribution Systems.' In discussing possible means of having the recommended research accomplished, it was suggested that a considerable portion of the research material could be undertaken by graduate students, particularly at the Master of Science level. Because of the lack of time, only the general titles were listed for research to be conducted at this level. Much of the research suggested at the conference could be more readily accomplished if the topics were identified with specific details and separated into segments in order that an individual graduate student could investigate a single segment.

The specific needs for research regarding small water management structures will be prepared and described in a report for general distribution. Particular emphasis will be given to topics which could be accomplished as a thesis by a graduate student at the Master of Science level. The topics will be prepared in sufficient detail and with appropriate background information that the problem can be readily attacked.

4.0261, SUBCRITICAL FLOW AT OPEN CHANNEL STRUCTURES

G.V. SKOGERBOE, Utah State University, Utah Ctr. For Water Resour., Logan, Utah 84321

The research accomplished under the previous matching fund grant, 'Design and Calibration of Submerged Open Channel Flow Measurement Structures,' will be extended to include additional practical physical situations, and to seek more answers to certain basic open channel flow problems. The previous research project showed that the methods of subcritical flow analysis are applicable to any form of side constriction or floor constriction. Submerged flow at gate structures will be studied in the laboratory

to evaluate the universality of the subcritical flow techniques for determining the discharge through any form of open channel constriction. In addition, the special case of zero constriction will be studied in the laboratory to determine if the methods of analysis are applicable for describing flow resistance in open channels under steady nonuniform flow conditions.

A large amount of data collected by previous investigators regarding the hydraulics of bridge constrictions will be evaluated using the techniques developed to date. The evaluation will include the hydraulic design of bridge constrictions and the collection of discharge measurements at bridge constrictions. The analytical tools developed to date will also be applied to developing hydraulic design criteria for open channel expansions.

4.0262, CROP AND SOIL MANAGEMENT OVER SHALLOW PLASTIC-LINED MOLE DRAINS

L.S. WILLARDSON, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

1. To evaluate the applicability of plastic-lined mole drains to the drainage problems of typical poorly drained shallow soils. 2. To evaluate the soil and crop management problems under shallow drainage conditions.

Plastic-lined mole drains with a 'zipper' type closure will be installed on the Drainage Farm of Utah State University. Spacings of 20, 40, and 80 ft. will be included. Placement will be at the maximum possible depth determined by soil permeability sampling. The drains will be approximately 600 feet long. Stainless steel wires will be inserted in the drains at the time of installation to enable evaluation of drain stability and root penetration. Cutler boxes for observation will be installed at the upstream end of the drain. Gypsum will be applied to replace the exchangeable sodium above the drain depth. Crops, perennial and annual, will be grown on the area and drain spacing effects on production evaluated. Forage crops will be grown during the period of soil reclamation and leaching. Periodic measurements of drain discharge will be made on the irrigation water and drain effluent.

4.0263, CONTROL OF INSECT VECTORS ON WATERFOWL MARSHES

D.M. REES, Univ. of Utah, Inst. of Environ. Biol. Res., Salt Lake City, Utah 84112

Research Objectives: 1. Determine by research conducted on selected study areas the most effective water management facilities and practices that can be used to abate mosquitoes, horseflies, deerflies and gnats that are produced on marsh areas bordering the Great Salt Lake. 2. Specifically attempt to reduce the amount of insecticides now used on this area for the control of mosquitoes and other insects by preventing the production of these pests and vectors by adequate water management procedures. 3. Include as an additional aspect of this water management program the development of the land and water for greater beneficial use for wildlife, natural and improved pastures, other suitable agricultural crops, recreational facilities, and other beneficial use. 4. If the results of this research program are successful on the study areas, establish and maintain demonstrations of these water management procedures.

4.0264, SOIL-WATER-PLANT RELATION TO ARTIFICIAL DRAINAGE

R.J. BARTLETT, Univ. of Vermont, Agricultural Experiment Sta., Burlington, Vermont 05401

The objective of this project is to determine the effects of artificial drainage on (a) crop adaptation, (b) crop growth and yields, (c) available moisture in the soil, and (d) soil physical and chemical properties.

DESCRIPTION OF WORK: The project is intended to be cooperative with and complementary to an Agricultural Research Service project involving the investigation of different methods of

4. WATER QUANTITY MANAGEMENT AND CONTROL

interception drainage on sloping land. Consequently, considerable effort in the present project is being devoted to the physical and chemical characterization of the soil at the drainage site under study.

In addition, certain interrelationships between soil, water, and plants are being studied. Relative amounts of oxidized and reduced iron in the rhizospheres of forage plants are being measured in an effort to learn why crop plants differ in their abilities to tolerate poor drainage and aeration.

Vermont State Government

4.0265, WATER YIELDS FROM SMALL WATERSHEDS

J.H. LILLARD, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

Objectives: (1) To correlate runoff yields and rates to watershed characteristics and climatic conditions. (2) To develop procedures for estimating surface and subsurface contributions to runoff from parameters of climate and watershed characteristics. (3) To develop procedures and formulas to reliably estimate seasonal and annual water yields.

Description of Work: - Continuous rainfall and runoff records from 10 mixed cover and 4 small unit source watersheds will be measured. Each watershed will be carefully characterized through soil, geologic, topographic and land use surveys; and correlations established between the watersheds characteristics and runoff yields. Additional investigations of soil moisture properties, effects of watershed size, shape and topography, land use patterns, soil conservation practices and management will be undertaken; and high speed data processing techniques employed.

5 soil types.

4.0266, DRAINAGE REQUIREMENTS AND PRACTICES FOR CROP PRODUCTION

J.H. LILLARD, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

Objective: To determine the drainage efficiency and economic feasibility of applicable land forming procedures in the Coastal Plain and Piedmont Regions.

Work Proposed: Four field experiments are used. Two are located in Princess Anne County where corn and soybeans are the test crops. One is located in Culpeper County on a flat river bottom where corn is the test crop and the fourth one is in Franklin County where tobacco is the test crop. At each location large field plots are carefully formed to precise specifications required for the local soil, topography and crop requirements. Records of time and labor costs are carefully kept. Yields and quality of crops are measured. The effect of the forming operation on soil physical properties and on fertility is studied. The application of land forming principles to create optimum conditions for improved tobacco production management systems is also studied in the Franklin County experiment.

SUPPORTED BY Virginia State Government

4.0267, MOISTURE CONSERVATION PRINCIPLES AND PRACTICES IN THE PACIFIC NORTHWEST

J.D. MENZIES, U.S. Dept. of Agriculture, Prosser, Washington

Object: To assess and evaluate effects of climatic, vegetative, soil and management factors on evaporation and evapotranspiration and to develop soil and crop management practices to improve efficiency of water use.

Plan of Work: Basic soil and climatic factors involved in movement of water and heat in soils and their exchange between the soil and atmosphere are investigated. Factors such as pore size, soil density, soil stratification, moisture and energy gradients, as well as topography, vegetation and physical aspect are most pertinent to these studies. Effects of soil temperature on moisture movement are pertinent, and emphasis is placed on developing and testing mathematical relationships to describe moisture and heat flow phenomena. Field studies are made on

moisture storage and utilization using a wide range of methods for controlling and directing runoff into storage for subsequent use, and for controlling evaporation through tillage, crop residue management and related procedures. The technique of adding soil moisture artificially is used when necessary to obtain more precise experimental control of the moisture variable. Specific studies are made relating various management practices to moisture storage at seeding time of various crops.

SUPPORTED BY U.S. Dept. of Agriculture

4.0268, HYDRAULICS OF SURFACE IRRIGATION

D.L. BASSETT, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

Objectives: To provide fundamental surface irrigation design understanding through the investigation of the hydraulic characteristics of surface flow by further development of mathematical models describing the flow in terms of the many variables involved, including appropriate testing under controlled conditions.

Description of Work Proposed: At present the interrelationship among the variables of unsteady, non-uniform surface flow are not known in sufficient detail for system design. Mathematical analysis will be used to investigate these variables. Preliminary equations for the rate of advance will be refined and expressions for the rate of recession will be developed. These developments will be examined experimentally insofar as possible in existing laboratory facilities designed especially for the study of the variables involved. These expressions may then be combined to form a model of a complete irrigation, which can be made to define uniformity of water application and optimum conditions for system design.

4.0269, THE ECONOMICS OF WATER TRANSFER - AN APPRAISAL OF INSTITUTIONS

C. DITWILER, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

1. To identify the principal institutional and legal processes through which transfers of water between uses and users take place in the state of Washington. 2. To appraise the effect of this machinery on certain economic efficiency and equity aspects of water use transfer.

1. Review existing literature, administrative reports, and legal statutes which relate to the use and transfer of water to develop an inventory of the existing devices for water transfer. Although emphasis will be placed at the state level of government, county and local devices will be considered if they should differ. 2. The attributes of these legal and institutional structures, insofar as they affect the efficient transfer of the water resource, will be appraised by criteria derived from general economic principles underlying the efficient allocation and transfer of resources.

SUPPORTED BY U.S. Dept. of Agriculture

4.0270, SIMULATION MODELING OF THERMAL EFFECTS ON SELECTED RIVER SYSTEMS

R.T. JASKE, Battelle Memorial Institute, Richland, Washington 99352

This program consists of the application of digital simulation program originally developed for the investigation and prediction of Columbia River water quality, primarily temperature, both above and below the Hanford plant, to perform water quality predictions associated with the erection of planning for nuclear electrical generating facilities in critical major river basin areas. These critical areas, or marketing regions would be selected by the Div. of RD&T in response to current licensing needs and other predictions.

Following successful completion of reports detailing trial simulations of the Deerfield and Illinois rivers, BNWL-628, and BNWL-728 the simulated effects of the Dresden II and III reactor stations under construction have been completed. During FY

4. WATER QUANTITY MANAGEMENT AND CONTROL

1969 it is planned to complete the simulation of the five state upper Mississippi drainage area through the year 2000 in order to determine the extent to which the river system could absorb waste heat under existing state water standards.

Also planned for FY 1969 is a start on adaptation of the basic digital simulation system to the Great Lakes region, starting with Lake Michigan. In addition, the headwaters streams of the Ohio River would be studied from a point above the Pennsylvania-Ohio border.

A preliminary investigation of the concept of colling a series of large stations situated along a canal with consecutive reuse of a single condenser canal flow would be carried out.

SUPPORTED BY U.S. Atomic Energy Commission

4.0271, COLLECTION OF JUVENILE MIGRANTS FROM RIVERS AND STREAMS

D.W. BATES, U.S. Dept. of Interior, Fish Passage Res. Program, Seattle, Washington

Anticipating that certain types of hydro-electric developments may either destroy large numbers of young migrant fish or may be impassable, a major research effort is being made to find practical and economical methods of collecting these young fish from rivers and streams before they reach the areas of danger. Methods of fish guidance and collection presently in use are only partially successful, or not applicable to large projects, or overly expensive. Research will be directed toward improving the efficiency of guiding techniques that have shown promise in the past, such as electricity, louvers, and lights; exploring the possibilities of more effective combinations of techniques; and developing new concepts of fish guidance and collection that would use a minimum of structure in the water. Facilities and methods for holding, handling, and transporting fingerlings will be investigated.

Four field stations are now in operation for such testing. Primary features of these stations are the flume installations which provide flexibility, wide range of velocity control, ease of fish observations and enumeration, and the testing of wild fish in as near to natural conditions as possible. Since the beginning of this project considerable advance has been made in the deflection or guidance of young migrants by means of flow accelerations and decelerations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

4.0272, METHODS OF ANALYSIS AND DETERMINATION OF EFFECTS OF ALTERNATIVE USES OF FORESTED LANDS ON STREAMFLOW

S.P. GESSEL, Univ. of Washington, Graduate School, Seattle, Washington 98122

Research is proposed to investigate: 1. the effects of forest management, harvesting regimes, and alternative uses of forested lands on hydrology of certain river basins in Washington. 2. the application of multivariate statistics for evaluation of alternative land uses and design of complex hydrologic models. 3. development of analog computer models for solution of complex hydrologic problems involving alternative uses of forested land.

Long-term U.S. Geological Survey streamflow records will be used with climatological records in multivariate analysis to develop regression equations for predicting daily streamflow. Major changes in vegetative cover which alter water yield should result in significantly different equations.

These equations will be used to develop analog models of the influences of various parameters and treatments on water yield of a river for a variety of physiographic conditions.

4.0273, HYDROLOGY OF WATERSHEDS ON SHALE SOILS

W.H. DICKERSON, West Va. University, Agricultural Experiment Sta., Morgantown, West Virginia 26506

Secure basic hydrologic data from small agricultural watersheds on shale soils. Determine effect of chiseling on runoff

from these soils as reflected by peak rates of flow and total yield. Relate effects of chiseling to soil properties and to production.

DESCRIPTION OF WORK - Four small watersheds of approximately 10 acres each, are being studied to determine runoff patterns and obtain basic hydrologic data. Instrumentation includes type H flumes with water stage recorders, standard and recording rain gauges and a fairly elaborate installation of resistance blocks to indicate soil moisture. After a calibration period, which is still in progress, two of the watersheds will be chiseled and two will be retained as checks. The effect of chiseling on hydrologic behavior will be determined by hydrograph analysis. An attempt will be made to relate the effects of chiseling to soil properties and to production by carrying out laboratory analyses of the soil and securing observations on forage production of the area.

4.0275, REDUCTION OF FLOOD RUNOFF, SEDIMENTATION AND STREAMFLOW IMPROVEMENT IN UNGLACIATED AREAS

R.S. SARTZ, U.S. Dept. of Agriculture, La Crosse, Wisconsin

Objective: To determine: (1) importance of forests in runoff and erosion control in Mississippi Valley; (2) disposition of precipitation on forest, brush, and other steeply sloping lands under different treatments, (3) and the influence of plantations on erosion and elements of the water cycle.

Plan of Work: The Staff is measuring flood flows from plots and experimental watersheds to determine the source of the flood runoff. They are measuring the interception of overland flow from upland field by forested slopes and are attempting to increase the effectiveness of the forest in dissipating this flow. They are continuing to evaluate the effect of forest plantations on snow buildup, soil freezing, and other soil properties and the effect of natural forests on soil freezing.

SUPPORTED BY U.S. Dept. of Agriculture

4.0276, IMPACT OF WINTER DRAWDOWN ON A SLOW-GROWING PANFISH POPULATION AND ASSOCIATED SPECIES

H. SNOW, State Div. of Conservation, Madison, Wisconsin 53701

Objectives: To determine through, before and after studies, the effects of a winter drawdown on survival, natural mortality, exploitation rate, growth rate, and age composition of all major fish species with special reference to the bluegill. To determine physical and chemical changes in water quality, before, during and after drawdown.

Procedures: A record of fishing statistics will be obtained through the use of a permit system of fishing at Murphy Flowage, Rusk County. Anglers will be interviewed and their catches examined at a checking station by Department personnel. Data on length, weight, scale samples, recovery of marked fish, and stomach samples of certain species will be obtained from angler

4. WATER QUANTITY MANAGEMENT AND CONTROL

caught fish. Other information necessary to complete a record of fishing success will be obtained. Information on individual anglers such as age, sex, residence, distance traveled, bait used, and fishing method used will be collected. All creel census information obtained is coded for machine tabulation.

Spring population estimates of standing crops of fish in Murphy Flowage will be accomplished by mark and recapture methods by trap netting and shocking. Fish marked by finclipping during spring estimates will provide marked fish for a population estimate based on angler returns. Population estimates during 1968-69 will be used to indicate population trends occurring after the drawdown.

Continued growth rate determination of game and panfish will be based on fish collected by netting, shocking and angler caught fish.

A water quality inventory of Murphy Flowage will be conducted to determine some of the more important characteristics that may have a bearing on fish ecology. Standard methods will be used to make water chemistry determination for pH, alkalinity, oxygen, conductivity, and light penetration.

During November 1967 the water level will be lowered several feet. This will reduce the total volume from 50 to 75 percent. The lower level will be maintained throughout the winter and refilling to normal level will take place in April, 1968.

4.0277, WATER RESOURCES OF SOUTHEASTERN WISCONSIN - FOX RIVER BASIN

R.D. HUTCHINSON, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Wisconsin.

Purpose: To determine the quantity and quality of water available for man's use and man's effect on the water supply in southeastern Wisconsin.

Methods: Available information on streamflow, lake stages, ground-water levels, pumpage, climate, water use, geology and quality of water will be compiled and interpreted. Seepage measurements and a ground-water flow map will be used to determine the interrelationships of ground water and surface water. The relationship of water use to the piezometric surface, water quality, and surface-water and ground-water conditions will be established.

A projection of anticipated water use to a definite future date will be made and the possible effects on the entire water resource will be described. The effects of alternate water-use possibilities will be illustrated.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Wisconsin State Government

4.0278, FLOOD INUNDATION STUDY, WISCONSIN

J.O. SHEARMAN, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

Purpose - To determine inundation limits for flood discharges so that meaningful zoning ordinances may be formulated.

Methods - The priority of areas where flood inundation studies will be conducted is to be determined by potential and/or existing hazard and the availability of topographic and hydrologic data. A sufficient number of channel characteristics will be obtained by field surveys to allow computations of water surface profiles in the selected reaches. The inundation limits for selected discharges (and for an actual flood where possible) will be presented on topographic maps.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Wisconsin State Government

4.0279, EFFECT OF IRRIGATION ON STREAMFLOW IN CENTRAL SAND PLAINS OF WISCONSIN

E.P. WEEKS, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

Purpose - To determine the effect of the expanding development of ground-water for irrigation on streamflow and ground-water levels.

Methods - Continuous or periodic measurements of streamflow (seven stations) ground-water levels (about 30 wells) precipitation (about 4 gages) and soil moisture (about 10 stations) will be made to determine the water budget in each basin. Aquifer thickness will be determined from existing wells and about 80 test holes. Hydraulic properties of the aquifer will be determined from five aquifer tests and by analysis of water-level recessions in several observation wells. Water usage will be determined from well pumpage and irrigated acreage inventory. Effects of pumpage will be computed from mathematical models of each basin based on nature and configuration of basin boundaries and hydraulic properties of the aquifer in the basin.

Milwaukee City Government - Wisconsin

4.0281, ARID LAND ECOLOGY AND ENVIRONMENT STUDIES IV. WATER QUANTITY MANAGEMENT

H.G. FISSEY, Univ. of Wyoming, School of Agriculture, Laramie, Wyoming 82071

The objectives are: (1) To determine the relationship of forage production to precipitation and other physical site characteristics. (2) To determine the relationship in terms of cover and composition, of vegetation on non-grazed sites to grazed sites. (3) To determine the relationship of forage production to soil moisture and temperature on selected sites. (4) To determine the effects of shrub control and grazing treatment on soil movement.

Forage production will be measured annually on study sites in western Wyoming using clipped plots of various sizes on transects. Average height, basal or crown cover, and composition will also be measured on plots, and a photographic record will be made. Precipitation measurements will be taken either four times a year or monthly at each site. Vegetation transects are located by restricted randomization inside and outside exclosures on various sites.

Soil moisture and temperature measurements will be made at different depths by use of neutron probes and thermistors.

Vegetation relationships of five shrub communities in the Big Horn Basin to soil and precipitation characteristics will be determined.

Analysis of data will be conducted with aid of electronic computer programs.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

4.0282, THE ECONOMICS OF WATER TRANSFER - AN APPRAISAL OF INSTITUTIONS

W.D. SCHUTZ, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Objectives: 1. To appraise the legal-institutional-administrative devices and processes through which transfers of water between uses and users take place and 2. To assess the consequences of these devices and processes on the economic efficiency and equity of water use and 3. To suggest desirable modifications in these devices and processes that might enhance economic efficiency or equity in the use of water resource.

4. WATER QUANTITY MANAGEMENT AND CONTROL

This research will involve an examination of present legal arrangements and processes concerned with the transfer of water rights, and also it will involve economic analyses of respective water uses. This latter step will provide a basis for generalizing as to the economics of transfer within and provide a basis for generalizing as to the economics of transfer within and between uses. Lastly the adequacy of present transfer arrangements will be appraised and suggestions made for changes where such are deemed desirable.

Identification of Pollutants; Sources and Fate of Pollution; Effect-of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment; Water Quality Control.

5.0001, WATER RESOURCES NEMATOLOGY

E.J. CAIRNS, Auburn University, School of Agriculture, Auburn, Alabama 36830

The investigation will begin with first a determination of the kinds of nematodes to be found in the various major types of water resources while seeking correlations with the major factors of the environment; second, investigations of the role of nematodes in bottom muds and rooted aquatic plants; and third, to investigate their role in food chains and other biotic cycles in the water resources. The proposed work will not be directly involved with public health aspects of water resources. In addition to the general survey, permanent sampling sites may be established where repeated observations over extended time periods of the effects of natural and man-made influences will be of value. Ecological data will be collected using accepted techniques for the water and bottom soils. Nematodes will be cultured with their community associates for the study of their bionomics and for the use and training of others in aquatic nematology.

5.0002, EVALUATION OF EARTHY MATERIALS FOR USE IN DECONTAMINATION OF WATER

J.B. DIXON, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

An aquatic herbicide and representatives of two groups of potential water contaminants are being investigated in the laboratory to determine their reactions with clays of soils and sediments. The influence of clay mineral type and interlayer hydroxy-Al on the fixation and release of diquat aquatic herbicide is being investigated. Mineralogical and environmental factors influencing the sorption and decomposition of endrin, dieldrin, and aldrin are being investigated. The influence of clay mineral type and anion reactions which may indicate how amiben is held are being investigated. The amount and type of reactions with clays will be considered in relation to leaching of amiben. Natural molecule sorption on clay minerals and soil clays is being investigated employing a vacuum sorption-desorption apparatus. This study is directed toward perfecting a method which will aid in predicting

extent of reaction of clay minerals with organic water contaminants.

Auburn University

5.0003, EFFECT OF HERBICIDES ON AN AQUATIC ENVIRONMENT

H.H. FUNDERBURK, Auburn University, School of Agriculture, Auburn, Alabama 36830

To study absorption, translocation and distribution of a phloem mobile herbicide (2,4-D) and a xylem mobile herbicide (simazine) in Eurasian milfoil. This will enable us to obtain basic information regarding the movement of chemicals in submersed plants as well as providing basic information to solve a specific problem.

To study the effect of diquat, paraquat, simazine, disclorobenzil, and at least 1 additional promising aquatic herbicide on certain metabolic processes of aquatic plants. This will provide additional information regarding the mode of action of these particular herbicides.

To study the degradation of diquat, simazine, and 2,4-D in an aquatic environment (water, plants, soil, and fish). This will provide additional information on the fate of chemicals in the aquatic environment which will tell us, among other things, how long a chemical can be used in a given location.

To determine the effect of promising aquatic herbicides on fish. This will provide information on the effect of the chemical directly on the fish as well as indirectly, e.g., measuring the effect on the fish food organisms.

5.0004, THE DISPOSITION OF PESTICIDES IN THE SOIL

A.E. HILTBOLD, Auburn University, Agricultural Experiment Sta., Auburn, Alabama 36830

Objective: To determine the distribution of pesticides in selected soils and their drainage waters, using sites to which known amounts of pesticides have been applied. B. To determine the physical, chemical and biological processes, and soil characteristics which are important in the disposition of pesticides in soils.

Procedures: Determine movement of atrazine, diuron, Treflan, and DMA in soil columns in laboratory under influence of leaching and evaporation of water. Determine volatilization of these herbicides from soil using radioactive labeled materials in planchets as function of temperature. Determine adsorption of labeled herbicide by soil clay minerals and organic fractions in water suspensions. Determine priming effects of organic matter decomposition on microbiological breakdown of herbicide as shown by bioassay. Verify microbiological processes by use of microbial inhibitors and sterilization. Determine relative rates of herbicide decomposition in soils treated repeatedly with herbicide vs. untreated soils. Isolate and identify microorganisms active in detoxication.

5.0005, TEXTILE WASTE TREATMENT PRACTICE

L.J. HIRTH, Auburn University, School of Chemistry, Auburn, Alabama 36830

The effects of textile wastes on receiving streams and on municipal treatment facilities may be minimized by reducing the volume and/or strength of the wastes either by manufacturing process changes or by industrial waste treatment. It is proposed to conduct an examination of existing textile plant waste treatment practices (A) To determine the present textile waste treatment practices and the problems involved; (B) To determine the workability, efficiency, and loading of existing systems of waste treatment; and (C) To conduct engineering-cost analyses of the existing systems of waste treatment to determine the most efficient means of satisfactorily treating specific wastes.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0006, GAMMA RADIATION OF TEXTILE WASTE WATER TO REDUCE POLLUTION

J.F. JUDKINS, Auburn University, School of Engineering, Auburn, Alabama 36830

The object of this proposal is to study gamma irradiation as a means of treating textile waste. The gamma irradiation will be supplied by a Cobalt-60 source with a variable geometry and a maximum disintegration rate of 12,000 curies.

Polluting agents common to textile waste are starch, basic hypochlorite bleach, dye compounds, sulfides, sulfites, and various detergents. The research will be broken down into three phases. These will be the study of the effect of gamma irradiation upon (1) aqueous solutions of individual polluting agents, (2) mixtures of the polluting agents, and (3) industrial samples of textile wastes. Experimental parameters, such as pH, dissolved oxygen concentration, temperature and radiation dosage will be varied.

The effect of the total irradiation dose and dosage rate on the starch samples will be evaluated by viscosity change, starch-iodine spectra and reducing sugars formed.

Standard chemical analysis will be used to determine the radiolysis products of the sulfides and detergents while radiolysis of the dyes will be evaluated spectrophotometrically. The chemical and biochemical oxygen demands of the radiolysis products and the original samples will also be measured.

Attempts will be made to predict optimum radiation dosage and dosage rate for degrading a particular waste to a satisfactory level. These predictions will then be tested by the radiolysis of actual textile industrial waste water samples.

5.0007, COLOR REMOVAL FROM TEXTILE DYE WASTES BY COAGULATION

J.M. JUDKINS, Auburn University, School of Engineering, Auburn, Alabama 36830

The treatment methods presently used for textile dye wastes have not been very successful in removing the color from these wastes. The discharge of highly colored wastes into streams is objectionable.

Laboratory studies using the standard jar test will be conducted to determine the extent of color removal from textile dye wastes by coagulation. Several coagulants, including alum and ferric sulfate, both with and without polymeric agents will be evaluated at different pH levels. Color removals will be measured with an electrophotometer. Initial and final BOD and sulfide concentrations will be determined on sulfur dye waste samples. The costs of the more promising treatment methods will be studied on a plant-scale basis.

5.0008, DYNAMICS OF CHEMICAL & PHYSICAL CHARACTER OF WATER, BOTTOM MUDS & AQUATIC LIFE IN A LARGE IMPOUNDMENT ON A RIVER (PHASE II)

J.M. LAWRENCE, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

This study of impoundments on parts of the Chattahoochee and Flint Rivers will supplement work completed under OWRP Project B-00 -ALA (Phase I). This study will indicate: (1) input-output relationships of salts and organic matter brought into the impoundment by creeks, streams and rivers and their distribution in water, biota and bottom muds within the impoundment and its tailwaters; (2) the influence of treated domestic pollution on chemical and physical characteristics of water throughout a long, relatively deep, power impoundment; (3) the importance of paper mill waste introduced into the prevailing domestic sewage pollution upon aquatic plant development and upon fish popula-

tion conditions in downstream areas of such polluted impoundments; (4) critical periods and conditions that may affect aquatic life in this and similar impoundments; (5) the dynamics of physiochemical characteristics of mainstream impoundments and aid in the establishment of water quality criteria for multi-purpose impoundments.

5.0009, CHEMICAL CONTROL OF WEEDS IN PONDS

J.M. LAWRENCE, Auburn University, Agricultural Experiment Sta., Auburn, Alabama 36830

1. To evaluate the activity of commercial and experimental herbicides and algicides on common pond weeds of this area. 2. To determine the toxicological effects of the more promising aquatic herbicides and algicides to fish and fish-food organisms under controlled laboratory and field conditions. 3. To investigate effects of more active aquatic herbicides and algicides on production of plankton, fish-food organisms, and fish in treated pools and ponds.

Some 25 to 50 potential aquatic herbicides will be available for controlled laboratory evaluations each year. The more active of these herbicides will be evaluated in the laboratory for toxicity to fish. Controlled field evaluations of the most promising herbicides on 14 species of aquatic weeds and 2 species of fish will be set up each year. Each field evaluation is designed for 2 years duration, and will provide information on herbicidal activity, water quality, plankton and fish production.

5.0010, BIOLOGICAL AND CHEMICAL OXIDATION OF SELECTED ORGANIC PESTICIDES

G.M. LEIGH, Auburn University, School of Engineering, Auburn, Alabama 36830

The purpose of this project is to determine the extent of biological and chemical degradation of certain of the chlorinated hydrocarbon pesticides that pose water pollution problems.

Lindane, heptachlor, endrin, and DDT in water solution will be subjected to the oxidizing action of chlorine, potassium permanganate, and potassium persulfate at three pH levels.

The degradation of lindane and heptachlor in water solution by acclimated organisms will also be studied.

Changes in pesticide concentrations will be determined with increasing contact times by electron-capture gas chromatography.

5.0011, WATER POLLUTION BY DAIRY FARM WASTES AS RELATED TO METHOD OF WASTE DISPOSAL

T.A. MCCASKEY, Auburn University, School of Agriculture, Auburn, Alabama 36830

Initial work of this project will include an examination of existing waste disposal systems on Alabama dairy farms and the apparent correlation of the waste with water contamination. Immediately available for this phase of the study are four dairy farms of the Alabama Agricultural Experiment Station System representing several soil and water conditions of the southeast. A number of large commercial dairies in the vicinity of Alabama cities will contribute to the study.

Field research will include studies of four systems of dairy farm waste disposal: 'dry' manure accumulation and periodic spreading with conventional equipment; semi-liquid manure collection in underground tanks and spreading on fields in liquid form using tractor-drawn equipment; liquid manure spreading via irrigation systems at frequent intervals; aerobic lagoons. Sampling sites will include: feedlots, croplands, pasture lands, streams or waterways, farm ponds, groundwater.

Laboratory studies will include the enumeration of the following groups of bacteria: fecal coliform and streptococci; salmonellae; shigellae; Clostridium perfringens. Chemical tests

5. WATER QUALITY MANAGEMENT AND PROTECTION

such as COD, pH, alkalinity, water hardness, nitrate and nitrite content, tannin and lignin, etc. will be made.

Field and laboratory data will be correlated with the view of developing guidelines on acceptable waste disposal systems for commercial dairy farms.

5.0012, PREDICTING AND PREVENTING FISH KILLS H.S. SWINGLE, Auburn University, School of Agriculture, Auburn, Alabama 36830

Objectives: 1. To improve methods of management of fish populations for sport fish production.

Procedures: 1. The effect of air introduced into the deepest water of a 22-acre pond upon stratification and oxygen distribution will be studied and compared with the effects of electric pumps circulating water from the deeper waters to the surface.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Alabama State Government

5.0013, STUDIES ON THE INTERACTIONS OF BACTERIA AND AQUATIC NEMATODES G.R. WILT, Auburn University, School of Veterinary Medicine, Auburn, Alabama 36830

The purpose of this research is to determine the kinds of bacteria ingested by aquatic nematodes in water resources and to seek basic information relating to bacteria-nematode interactions. This work will not be directed toward public health aspects, but rather toward a much broader base.

Bacteria will be isolated from single, surface-sterilized nematodes of known identity. Isolation and culturing will be done under a variety of conditions to insure the greatest number and diversity of bacterial types. The enumeration and identification of bacteria will be done by standard microbiological procedures.

Various substances obtained from active cultures of nematodes will be studied for their effect on bacterial growth by respirometric techniques, and/or turbidimetric techniques of determining total growth in media containing test substances, as compared to growth in control media without these substances.

Experiments with nematodes in the same stage of development and exposed to certain bacterial metabolites will be conducted with the Cartesian diver apparatus in order to determine effects on nematode respiration. Alternative methods of studying the effect on nematodes of bacterial metabolites will be considered.

5.0014, ELECTROSORPTION AND DESORPTION PROCESS FOR DEMINERALIZATION R.E. LACEY, Southern Research Institute, Birmingham, Alabama

In the proposed additional work the electrosorption process will be evaluated for demineralization of natural brackish waters containing appreciable quantities of calcium sulfate and calcium bicarbonate.

Experiments will be conducted on two natural brackish waters over periods up to three months with each feed water to determine the degree of demineralization, coulomb efficiencies, extent of interference of scale-forming substances, and resistances per cell pair.

Experiments will be performed also to study the application of filmforming materials containing ionogenic groups onto porous substrates to form electrosorption membranes.

5.0015, DEMINERALIZATION OF WASTEWATER BY THE TRANSPORT-DEPLETION PROCESS E.W. LANG, Southern Research Institute, Birmingham, Alabama (14-12-443)

The primary objectives are to determine the technical feasibility of the transport-depletion process for reducing the dissolved

solids of secondary wastewater and to determine how well the transport depletion process can overcome the problems that have been encountered when conventional electrodialysis is used with wastewater. Other objectives include determining operating limits of the process, including types of feed pretreatment, when demineralizing secondary effluent, obtaining engineering design data and providing preliminary cost estimates to indicate the economic promise of this process for demineralizing wastewater.

To achieve these objectives, it is proposed to install and operate a transport-depletion stack and auxiliary equipment at a local sewage treatment plant. The treatment plant effluent, augmented with salts to bring the composition up to typical sewage effluent composition if necessary, will be demineralized over a wide range of operating conditions. The maximum demineralization capacity of the unit and the ability of the unit to operate without intolerable increases of electrical resistance with different types of water pretreatment, with a range of solution velocities within the stack compartments, and with high ratios of product-waste flows will be determined.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0016, FREQUENCY DISTRIBUTION OF BIOLOGICAL POLLUTANTS IN SHELLFISH AND THE MARINE ENVIRONMENT W.F. HILL, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Gulf Coast Mar. Lab., Dauphin Island, Alabama 36528

It is the purpose of this investigation to determine, define, and evaluate the potential public health hazards attributable to the presence of pathogenic microorganisms (including pollution indicators), viruses, and biotoxins in the marine biota and the associated environment. Samples will consist of oysters, marine sediments, soils adjacent to the marine environment, and seawater collected from shellfish growing areas of the Gulf of Mexico and South Atlantic States. Sampling will be on a monthly basis. The tasks are oriented toward: (1) determining the enteric virus population as to frequency and type distribution in estuarine waters from selected sampling stations in the Mobile Bay area and (2) determining the fate of coliform, fecal coliform, and selected enteric pathogens with emphasis on the influence of soil types and climatic conditions on survival. Hydrographic and ecological parameters associated with these tasks will also be evaluated.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0017, BIOLOGICAL METHODS RESEARCH W.F. HILL, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Gulf Coast Mar. Lab., Dauphin Island, Alabama 36528

The purpose of this investigation is to develop new and/or improved methods for (a) determining fecal pollution of shellfish and shellfish growing waters and (b) isolating, concentrating, and enumerating viruses from the marine environment. Studies to be initiated will be concerned with (1) evaluating rapid methods for detecting and enumerating fecal coliform organisms; (2) investigating the feasibility of using chemical indicators for fecal pollution; (3) developing methods for isolating enteric pathogens from shellfish and shellfish growing areas; and (4) developing and evaluating new and/or improved methods for isolating, concentrating, and enumerating viruses from shellfish, and the marine environment.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0018, INVESTIGATIONS ON CIGUATERA-LIKE BIOTOXINS IN SHELLFISH W.F. HILL, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Gulf Coast Mar. Lab., Dauphin Island, Alabama 36528

Mass cultures of the toxigenic marine dinoflagellate, *Gymnodinium breve*, have been established and will be increased in volume of production to provide large quantities of material for (1) studies oriented toward the isolation, purification, and characterization of the ciguatera-like toxin produced by this organism; (2) investigations of the process by which *G. breve* toxin is accumulated, retained, and eliminated by edible shellfish; (3) the development of analytical techniques for rapid quantitation of

5. WATER QUALITY MANAGEMENT AND PROTECTION

the toxin, and (4) studies designed to assess the toxicity of G. breve aerosols.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0019, DEPURATION OF MICROBIAL POLLUTANTS IN SHELLFISH

B.E. HUNTLEY, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Gulf Coast Mar. Lab. , Dauphin Island, Alabama 36528

The purpose of this investigation are (1) to determine, define, and evaluate (a) the environmental conditions that predispose oysters to accumulate and eliminate microorganisms. (b) the conditions for effective treatment and ultraviolet disinfection of seawater, and (c) the various environmental factors that influence oyster activity; and (2) to design, construct, operate, and evaluate a prototype depuration system capable of processing commercial size lots of oysters. Ongoing studies are primarily oriented toward (1) determining the effectiveness of UV radiation as a treatment method for seawater to be used in depuration with emphasis on enteric viruses; (2) determining the effect of selected salts on bacterial elimination rates of the eastern oyster; and (3) continuing the evaluation of a prototype depuration system as to operational suitability with emphasis on the elimination of fecal coliform by oysters.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0020, DEPURATION OF CHEMICAL POLLUTANTS IN SHELLFISH

F.C. KOPFLER, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Gulf Coast Mar. Lab. , Dauphin Island, Alabama 36528

This study is being conducted to determine the extent and rate of accumulation of pesticides, heavy metals and/or other chemical contaminants in shellfish. Emphasis is currently oriented toward heavy metals studies in which oysters are used as the test animal. Initially, zinc was investigated, and present studies are now concerned with the uptake of chromium in three ionic states by oysters. Studies will also be undertaken of chromium in three ionic states by oysters. Studies will also be undertaken to determine the requirements for maximum elimination of chromium by oysters under depuration conditions. As this effort progresses, additional heavy metals will be studied. Atomic absorption spectrophotometry is being used for the analyses.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0021, FREQUENCY DISTRIBUTION OF CHEMICAL POLLUTANTS IN SHELLFISH AND THE MARINE ENVIRONMENT

J. MAYER, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Gulf Coast Mar. Lab. , Dauphin Island, Alabama 36528

The purpose of this investigation is to determine, define, and evaluate the potential public health hazards attributable to the presence of chemical pollutants in shellfish and other marine biota and in the associated environment. Studies are concerned primarily with determining the frequency distribution of chemical pollutants including, but not limited to, trace metals, pesticides, and various organic and inorganic compounds in shellfish and the marine environment. Current emphasis is oriented toward determining the distribution and concentrations of heavy metals in oysters and seawater collected from the Mobile Bay area and in oysters collected from coastal states, other than Alabama, of the Gulf of Mexico and the South Atlantic regions. Sampling is conducted on a monthly basis. Samples are being examined for lead, zinc, copper, cadmium, and chromium by atomic absorption spectrophotometry and for mercury by a chemical method.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0022, PROJECT 2203 EFFECTS ON PHYSIOLOGY WORK UNIT 53 CHRONIC EFFECTS OF ENDRIIN ON BLUEGILLS

C.J. KNOWLTON, U.S. Dept. of Interior, Fish Pesticide Res. Lab. , Marion, Alabama

The purpose of the work is to measure chronic effects of endrin on bluegills at Marion, Alabama. The bluegills are distributed among 12 earthen ponds and are given a single set of endrin treatments, at two concentrations. Samples of fish, invertebrates, bottom sediments, water, and aquatic vegetation are collected according to a pre-arranged schedule. Residue analyses are made at Marion, Alabama, on most kinds of samples. Fish populations are studied for growth, mortality, and reproduction. Fish are examined for histopathology at Columbia, Missouri.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0023, NUTRITION OF WATER WEEDS

J.B. MARTIN, U.S. Tennessee Valley Auth. , Muscle Shoals, Alabama

Nutrition of various species of water weeds which have infested certain areas of the TVA reservoirs is under investigation. It is hoped that a knowledge of their nutritional requirements will lead to development of control measures.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.0024, BIOLOGICAL PROPERTIES OF SEWAGE LAGOONS AT TUSKEGEE, ALABAMA

K.S. CHAHAL, Tuskegee Institute, School of Agriculture, Tuskegee Institute, Alabama 36088

This study will determine the efficiency of sewage lagoons and the effect of microorganisms and their byproducts on the quality of water in receiving streams. Samples of raw sewage and lagoon effluent will be analyzed for total solids, BOD, dehydrogenase activity, total microbial count, and relative proportions of different kinds of microorganisms during different seasons of the year. Microbial byproducts will be extracted from cultures of microorganisms isolated from samples. The biological activity of the byproducts will be tested using mammalian tissue culture technique. Parameters for bioassay will be cytochemical changes, synthesis of protein and nucleic acids, and total cell count. Identification of compounds will be by IR and UV spectrophotometry, gas, paper, and thin layer chromatographic methods.

Tuskegee Institute

5.0025, CONSERVATION OF FRESH-WATER RESOURCES BY DEEP-WELL DISPOSAL OF LIQUID WASTES

D.M. GRUBBS, Univ. of Alabama, Water Resources Program, University, Alabama 35486

This project will evaluate the geological and engineering parameters of subsurface rock formations which will permit disposal of liquid waste by deep-well injection procedures. Criteria and techniques will be sought which will have both quantitative and qualitative regional application in the development of underground disposal facilities. This will in turn alleviate the problem of usage of surface waters as carriers of waste effluent. Studies will be focused upon: 1. Derivation and analysis of information such as rock core and cuttings lithology, analysis of reservoir fluids, results of rock matrix and cementing material, electrical and other well-logging parameters, and petrophysical data such as porosity and permeability; 2. Laboratory analysis from simulated injection of liquid wastes into actual reservoir core samples to determine capacity, receptivity, continuity and compatibility, and pressure-time-distance response as a basis for prediction of systems behavior; 3. Development of mathematical models applicable to the identification and evaluation of potentially receptive disposal zones. Determination of restrictions to be placed upon types and volumes of liquid wastes which may be injected into specific deep-well reservoirs.

5.0026, DEVELOPMENT OF WASTE STABILIZATION LAGOONS FOR APPLICATION IN ALASKA

S.E. CLARK, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

The project objectives are to evaluate waste stabilization lagoon efficiencies while operating under Alaska's severe climatic conditions and to develop operation techniques which will assure adequate waste treatment throughout the year. A pilot plant located at Eielson Air Force Base is being placed in operation this winter utilizing the theory of storage of the winter's wastes with spring, summer and fall discharge. A polishing lagoon will be placed in operation during the warmer months of the year.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0027, SUBARC AERAT LAG INVES BIOKIN REQUIR SEASON & DIURN EFF ON NUT BAL

S.E. CLARK, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

The project objectives are to evaluate: a. To develop design and operational standards for artificially aerated waste stabilization lagoons under Alaskan conditions. b. To evaluate parameters contributing to effluent quality, power and maintenance costs, reliability under rapidly varying ambient conditions, and the effects on the receiving waters.

A pilot plant has been constructed and will be placed in operation at Eielson Air Force Base.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0028, COMPLETE MIX ACTIVATED SLUDGE UNIT PROCESS ADAPTION TO LOW TEMP

S.E. CLARK, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

The project objectives are to evaluate the influences of Alaska's severe climatic conditions upon the activated sludge process in the loading range between 0.02 and 0.40 no. 5-Day BOD per no. of MLVSS, and to develop techniques for minimizing the detrimental climatic influences. Laboratory scale pilot studies utilizing settled sewage are in progress to determine low temperature biokinetics including a major emphasis devoted to developing techniques of effective solids separation that will be feasible in the Alaska environment and under the Alaskan inflated economy. Large scale outdoor pilot facilities are planned.

5.0029, STUDY OF ASSIMILATIVE CAPACITY OF ARCTIC AND SUB-ARCTIC STREAMS

P.J. FREY, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

Information on the effects of extreme environments (long periods of darkness or of light, total ice cover for nine months of the year, low maximum water temperature) on a river's capacity to assimilate pollution, and on the organisms which inhabit the streams and are responsible for the degradation of pollution will be obtained so that it will be possible to predict and evaluate the effects of pollution on these streams.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0030, EFFECTS OF LARGE SCALE FOREST FIRES ON WATER QUALITY IN THE INT. AK

F.B. LOTSPEICH, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

The purpose of this project is to evaluate the significance of large scale forest fires as polluting agents in Alaska's interior. Evidence from work in other states suggests that soil properties change as a result of burning, the degree of change being proportional to the severity of burning. Little or no work is available on the effect of these changes in soil properties on water chemistry of

streams draining burned watersheds. Moreover, the effects of burning on stream biota, resulting from aberrations in water chemistry, has received little attention. This project is designed to compare soil chemistry to water quality of streams draining these watersheds. Species composition of stream biota will be related to water chemistry to provide information on the significance of burning to biological changes caused by forest fires.

5.0031, TOTAL ORGANIC CARBON AS A POLLUTION CONTROL PARAMETER IN SUB-ARCTIC WATERS

E.W. MUELLER, U.S. Dept. of Interior, Alaska Water Laboratory, College, Alaska 99701

Organic materials are one of the major sources of natural pollutants in arctic waters. The scope of this research is to evaluate a number of methods for determining the concentration of organic materials in the natural waters of Alaska. The approach will involve a series of experiments with oxidation of the organics to carbon dioxide and measurement of the carbon dioxide in a non-dispersive infrared analyzer. Combustion will be accomplished both at high temperatures in a stream of oxygen, and through wet chemical oxidations. Typical compounds will be used as standards to determine the effectiveness of the method. Comparison will be made between chemical oxygen demand of field samples and the values found by total carbon determination.

5.0032, ORGANISMS RESPONSIBLE FOR TOXICITY OF ALASKAN CLAMS

M.B. ALLEN, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The aims of this project are: (1) to identify the organism(s) responsible for toxicity of clams and mussels in Southeast Alaska. (2) To isolate these organisms in axenic culture and study the effect of environmental variables on their growth and toxicity, with the aim of being able to predict when clams might or might not be toxic, or hopefully, eventually to control toxicity in the shellfish population.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0033, DYNAMICS OF THE NITROGEN CYCLE IN LAKES

V.A. BILLAUD, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The transformation rates within the freshwater biological nitrogen cycle are under investigation using the stable isotope of nitrogen, ^{15}N as a tracer. The role of the nitrogen cycle in the productivity regimes of lakes, in bloom development, in under-ice winter metabolism are all included. The role of denitrification is emphasized, as well as nitrogen fixation, both under aerobic and anaerobic conditions. Possible heterotrophy or mixotrophy under winter and spring ice-cover are investigated using tritium labeled organic compounds. Gas chromatography is being used to study gas production during anerobic metabolism in lake waters. Detailed limnological studies of lakes in the subarctic are concurrently being carried out.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0034, BIOLOGICAL EFFECTS OF HEAVY METAL POLLUTION

D.K. BUTTON, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The single major process that mediates the conversion of the world's non-living biomass to reusable components is microbial degradation. The effort here is directed toward understanding this process as it occurs in nature with particular reference to aquatic systems. Since rates are normally controlled here by chemical concentrations it is useful to describe this relationship. These extracellular components may have a process-supporting, neutral or inhibitory effect.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Since heavy metal pollution is a growing phenomenon of our waters due to mining industry and car exhaust, and since the nature of enzymes is to bind available heavy metals with a concomitant alteration in catalytic ability this specific project is directed toward examining heavy metal poisoning of microorganisms, in theory, and as it occurs in Alaskan mining areas.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0035, ECOLOGY & NITROGEN CYCLE IN A MARINE PLANT COMMUNITY J.J. GOERING, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The physiological ecology of eelgrass (*Zostera marina*) communities will be examined in concurrence with the dynamics of the nitrogen cycle in a lagoon on the Bering Sea coast of Alaska. A comparison of natural conditions will be made with an area receiving untreated sewage. This will include an examination of the relationship between the primary producers and nitrogen cycle, with emphasis on the role played by nitrogen in the total productivity of the community. Also to be included is the control of the environment on the growth and morphology of the dominant primary producer, eelgrass. The contribution of organic matter, particulate and dissolved, from the eelgrass communities to near-shore oceanic food webs will also be investigated.

5.0036, BIOLOGICAL DEGRADATION OF WASTES UNDER PSYCHROPHILIC ENVIRONMENTS R.S. MURPHY, Univ. of Alaska, Inst. of Water Resources Res., College, Alaska 99735

Waste discharges into natural surface waters in arctic and subarctic environments have traditionally been regulated by standards developed for temperature climates. Consequently, the natural abilities of streams and lakes at high latitudes to assimilate wastes is comparatively unknown at present.

This investigation will study metabolic reaction rates of mixed microbial cultures natural to a psychrophilic environment. Original cultures will be obtained from streams, lakes, and soils of Interior Alaska. The metabolic rates will be investigated in 2 liter respirometer vessels at temperatures ranging from 0.5 degrees C to 20 degrees C. Pure substrates as well as complex substrates (sewage) will be utilized.

The results of this investigation will be an aid in the prediction of the effect of a waste discharge upon a natural body of water. In addition, these same parameters will be used for the design of biological treatment processes operating under psychrophilic regimes.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Alaska

5.0037, PRACTICAL APPLICATION OF FOAM FRACTIONATION TREATMENT OF LOW QUALITY WATER R.S. MURPHY, Univ. of Alaska, School of Engineering, College, Alaska 99735

A bench-scale study using foam fractionation techniques to remove iron and color from a groundwater was recently completed. The results indicated that the process was sufficiently efficient to warrant the construction of a 100 gallon pilot plant in order to determine the economics of the process in the field. This research will be concerned with the construction, operation, and economics of this pilot installation. Greater than 99.5 percent iron removal is predicted (raw water: 30mg/l Fe) for this unit.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Alaska

5.0038, EVALUATION OF AN OXIDATION-DITCH WASTEWATER TREATMENT PLANT IN SUBARCTIC ALASKA R.S. MURPHY, Univ. of Alaska, School of Engineering, College, Alaska 99735

The project plan is designed to evaluate an existing oxidation-ditch wastewater treatment facility located in the sub-Arctic near Fairbanks, Alaska. Operation procedures, problems and economics of the system will be studied. Sufficient data will be obtained such that a mathematical model describing the biokinetics and oxygen requirement of the system can be formulated. Investigations will cover both the warm and cold temperature regimes as well as the transitions between these extremes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl University of Alaska

5.0039, MONITORING THE EFFECTS OF LAND USE ON SALMON PRODUCTION T.C. HOFFMAN, State Div. of Comm. Fisheries, Juneau, Alaska

Objectives: To complement and extend the presently established joint monitoring effort of the U.S. Forest Service and the Alaska Department of Fish and Game in order to determine if stream changes due to logging and other causes occurred and to what extent these changes affected the potential of these streams to produce salmon fry.

Characteristics Monitored: (1) Composition of streambed spawning areas. (2) Streamflow and water temperature. (3) Stream channel configuration and amount and kind of debris in the stream. (4) Classification of soil types in the watershed. (5) Sources of sediment. (6) Production of salmon fry and survival. (7) Assessment of adult salmon escapement.

Characteristics studied prior and subsequent to land use and observations taken yearly.

The studies to date have been a cooperative venture between the U.S. Forest Service and the Alaska Department of Fish and Game with each agency responsible for part of the work. The study is primarily to establish a base for management action and is presently being conducted in one important salmon producer in Southeastern Alaska and will be extended to three with special reference to logging and road building.

Procedures: For these characteristics monitored by the Alaska Department of Fish and Game as described in Fisheries Research Institute, University of Washington Field Manual dated 17 February 1964.

5.0040, FERTILIZATION OF WOODS CANYON LAKE J.A. ERCOLE, State Game & Fish Department, Phoenix, Arizona

Objective: To determine the cost per pound of increased harvest derived from artificially fertilizing an infertile 50-acre trout lake.

Procedures: 1. Ten vertical columns of water in the lake will be isolated by tubes made of thin translucent polyethylene film. The tubes will be positioned in random groups and anchored firmly. The lower ends will be sealed with large balloons after tubes are placed in lake.

Commercial grade fertilizers, in solution, will be added to the tubes in controlled amounts. Four replicated experiments will be conducted simultaneously. Two unfertilized tubes will serve as controls.

Optical depth, turbidity, pH, total dissolved solids, and temperature and oxygen stratification determinations will be obtained periodically during each series of fertilization experiments.

2. A large plant of three inch rainbow trout will be made. These trout will be marked with a double fin clip differing from the original clip. Growth rates and condition factors will be computed from marked fish; condition factors will be computed for any unmarked fish trapped in the net. 3. In order to establish the 'before and after' effect of fertilization, several measurements will be made which will indicate changes in certain limnological features of the lake.

Quantitative study of plankton will be conducted during the spring, summer, and fall months at one month intervals.

4. A creel census will be conducted during the fishing to obtain an unbiased estimate of fisherman hours and total harvest.

5.0042, ADVANCED WASTEWATER TREATMENT USING POWDERED ACTIVATED CARBON IN RECIRCULATING SLURRY CONTACTOR-CLARIFIERS

C.F. GARLAND, Inflico Incorporated, Tucson, Arizona 85703 (14-12-400)

The objective of this project is to determine the process and operating parameters for adsorption of dissolved impurities from the secondary effluent of a municipal activated sludge plant by powdered activated carbon in two stages of continuously recirculating slurry contactor-clarifiers. The proposed work includes: 1. Preliminary laboratory investigations to evaluate three different commercial grades of powdered activated carbon will be performed during the procurement and construction periods (10 weeks). Carbon coagulation studies, adsorption isotherm studies, and adsorption rate studies will determine which activated carbon will be used in the subsequent field operations. 2. A 10-30,000 gal/day, two stage countercurrent, continuously recirculating contactor-clarifier will be constructed and evaluated during continuous operation for a twelve-week period. The independent process variables of flow rate, activated carbon feed rate, and slurry solids inventories will be investigated over ranges sufficient to determine the optimum combination for removal of adsorbable substances as determined by COD measurements. A brief study will be made of a 'single-stage' contacting system.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0043, TUSCON WASTEWATER RECLAMATION PROJECT

P. BEERMANN, Tucson City Government, Tucson, Arizona 85701

The project objectives are to demonstrate the chemical, biological, and virological safety, and the aesthetic acceptability of including renovated wastewater as a dependable and substantial portion of the future Tucson water supply and to determine what species of fish will live and provide the optimum production and growth rate in renovated wastewater. The renovated water will be supplied from a pilot scale spreading basin - horizontal flow filtration facility and experimental ponds.

5.0044, SOILS, PESTICIDES, AND THE QUALITY OF WATER

G.R. DUTT, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives; a. Existence of pesticides in the soil solution. b. To identify the properties of pesticides and of soils that control the extent of movement of pesticides in and through soils. c. To ascertain the solubility characteristics of pesticides sorbed on soil particles and hence the effect on suspended soil on the concentrations of pesticides in water.

Description of Work Proposed: The interactions of triazines and substituted ureas with soil components, e.g., water, organic fractions and mineral fractions, will be studied in coordination

with Hawaii. The solubility of the pesticides will be determined in distilled water and in solutions containing certain solutes. Procedures will be developed for extracting triazine from soil components. Sorption isotherms will be found for various organic fractions and thermodynamic coefficients determined for these constituents. Attempts will be made to see if predictions of concentration of pesticides in the effluent from the columns can be made from measurements of soil and water constituents and distribution coefficients found in the equilibrium studies.

5.0047, FACTORS AFFECTING ZOOPLANKTON PRODUCTION IN FOUR ARIZONA LAKES

W.J. MCCONNELL, Univ. of Arizona, Arizona Coop. Fishery Unit, Tucson, Arizona 85721

The goal of the investigation is to identify factors other than rate of primary productivity which influence the production of zooplankton in four lakes. Factors being considered are toxic and beneficial trace metals, bacterial populations and plant nitrogen content. Trace metals concentrated in aquatic macrophytes are being analyzed by atomic absorption spectrophotometry, bacteria are being counted directly under phase contrast, and nitrogen in aquatic macrophytes is being determined by the Kjeldahl method. Zooplankton biomass is being measured with a metering tow net.

5.0051, INTERACTION OF INORGANIC AND ORGANIC FERTILIZER MATERIALS WITH PESTICIDES AS RELATED TO WATER QUALITY IN SOILS

D.A. BROWN, Univ. of Arkansas, School of Agriculture, Fayetteville, Arkansas 72701

The effect of Agricultural pesticides on plant, animal, and human life is important to all people in this country. Since it appears evident that agricultural pesticides and fertilizers will continue to be used on a large scale basis and since pesticides is a potential cause of poor water quality, it is important that an agricultural pesticide fertilization program which will help to minimize the contamination of water with pesticides be worked out.

The immediate objective of this research is to evaluate the interaction between organic and inorganic fertilizers and the behavior of pesticides in soil as related to water quality. Emphasis will be placed on the solubility, adsorption, and degradation of pesticides as influenced by differing concentrations of organic and inorganic fertilizers in soil. The ultimate objective is use of the data found above in order to predict the potential effect of pesticides on the quality of domestic, recreational and agricultural water supplies. Four pesticides (aldrin, prometryne, trifluralin, an amiben), seven fertilizers (ammonium nitrate, ammonium sulfate, anhydrous ammonia, urea, potassium chloride, triple super-phosphate, and limestone) each at a low and a high rate of application, and three soils (Crowley silt loam, Sharkey clay, and Dundee silt loam) will be used. Isotopically tagged pesticides will be employed in the solubility and adsorption studies. The rate of diffusion in these soils will also be studied in terms of pesticide fertilizer interaction.

5.0052, INTERACTION OF INORGANIC AND ORGANIC FERTILIZER MATERIALS WITH PESTICIDES AS RELATED TO WATER QUALITY IN SOILS

D.A. BROWN, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Objectives: (1) To evaluate the effect on solubility and adsorption of pesticides in soil containing various concentrations of fertilizer materials, (2) to determine the degradation rate of pesti-

cides in soil containing differing amounts of fertilizer materials, and (3) to predict the potential effect of results found under objectives 1 and 2 on the quality of water which may be used as domestic, recreational, and agricultural water supplies.

Description of Work: The solubility and adsorption of four pesticides, Aldrin, Prometryne, Trifluralin, and Amiben will be measured in three soils, Crowley silt loam, Sharkey clay, and Dundee silt loam at two rates each of ammonium nitrate, ammonium sulfate anhydrous ammonia, urea, potassium chloride, triple superphosphate, and limestone. Solubility of the pesticides will also be measured in pure water and in aqueous solutions of the fertilizers. Radioactive-tagged pesticides will be used in these studies. Degradation of the pesticides of the soil-pesticide-fertilizer combinations will be measured with gas chromatography techniques; infrared and D.T.A. analysis will also be used if necessary. The potential affects of pesticides applied to soil upon water quality will be evaluated using the results obtained under objectives (1) and (2).

5.0053, A EUTROPHICATION MODEL OF THE WHITE RIVER BASIN ABOVE BEAVER RESERVOIR IN NORTHWEST ARKANSAS

R.A. GEARHEART, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

This research will attempt to evaluate the various nutrient contributors to a reservoir in Northwest Arkansas, namely Beaver Reservoir. The purpose is to predict by use of a mathematical model the rate at which this relatively new reservoir will accumulate nutrients. This involves identifying and quantifying on a time-series basis those elements which accelerate eutrophication. The three most common elements known to affect aquatic productivity are carbon, nitrogen, and phosphorus. The major contributors of nutrients to receiving waters are: sewage effluent, urban runoff, agriculture practices, and recreational activities, - all of which can be isolated and monitored in this particular system.

The implementation of this research is as follows: 1) A preliminary examination and isolation of nutrients contributors. 2) Location of sample points based on preliminary examination. 3) Establishment of a sampling schedule which will yield the greatest information with the smallest error. 4) Collect necessary data for input into mathematical model. 5) Construct and computerize mathematical model with acquired data. 6) Predict future eutrophication rates with mathematical model.

5.0056, EFFECT OF SURFACE FILMS ON GASES DIS- SOLVED IN WATER

J.G. HAWKE, Univ. of Sydney, Sydney, Australia

Efforts directed towards elucidation of mechanism of gas transport processes through thin films on water, which is related to studies on evaporation of water through monolayers. In use of monolayers to retard water evaporation and H₂S loss from sewers etc.; effect on marine life by its control of other gases should be considered. Further, CO₂ diffusion through films is a necessary preliminary study to our understanding of respiration in plants and animals.

Immediate efforts are concentrated on CO₂ although some work with H₂S has been done. The Hawke transmission coefficient "T" will be measured as a function of temperature for a number of long-chain compounds etc. to determine dependence of activation energy (E) on molecular structure, e.g., chain length, polar head groups, packing etc. The CO₂ work will be extended to H₂S, oxygen and certain organic vapors. Biological membranes are thought to contain enzymes whose function it is to lower the activation energy. The effect of charged monolayers and inhibitory or facilitating agents added to the substrate may assist our understanding of the function of biological membranes.

5.0057, EXPLORATORY STUDIES ON SIMPLIFYING DISPOSAL OF FOOD PROCESSING WASTES

A.I. MORGAN, U.S. Dept. of Agriculture, Albany, California

Object: To minimize problems of disposing of food processing wastes by removing soluble salts, oxidizing organic solutes, and/or reclaiming waste water.

Plan of work: Major emphasis will be directed toward developing treatments for soluble, and suspended solid, wastes from fruit and vegetable processing operations. Treatment of effluents will involve three phases: (1) Salt removal: Lye peeling wash waters, or un reusable brine will be desalted by electrophoresis, ion exchange, ion exclusion or electrodialysis. Salts will be recovered in cathode cells, by ion exchange regeneration, or ion exclusion rinsing. The value of recovered salt or caustic will be exploited where possible. Starch, or other insolubles, will be recovered from wash wastes by settling, filtration or centrifugation. (2) Oxidation of organic solutes: Disposability of fruit canner wastes will be improved by spraying onto extended surfaces, oxidation at an anode in an electrolytic cell, spraying into warm air after intense heating under pressure, adsorption on charcoal which can be regenerated, adsorption on clays which can be discarded or by other inexpensive methods. (3) Water reclamation: Water of reusable quality will be removed from waste streams by reverse osmosis, electro-osmosis, or direct osmosis.

5.0058, OPERATION OF POTATO PROCESSING PLANTS TO REDUCE WASTE AND STREAM POLLUTION

M.L. WEAVER, U.S. Dept. of Agriculture, Albany, California

Object: To help alleviate the growing problem of disposing of wastes from plants processing potatoes into food products, without polluting streams or the air, through the development of new or modified in-plant operations to reduce the quantity of wastes discharged and/or to convert them to a form more readily adaptable to available methods of waste treatment.

Plan of Work: Investigations will be made to determine the basic nature of the waste material, i.e., amount and kind of both mineral and organic solid particles, amount and kinds of soluble materials, pH, biological oxygen demand, chemical oxygen demand, etc., associated with different types of processed potato food products. The most economical and efficient means of removing suspended solids from aqueous plant wastes will be sought. Also, how to separate the mineral matter from insoluble organic solids. Possible uses for the suspended organic solids will be explored. Investigations will be made of ways to reduce the total quantity of soluble solids to be disposed of and to concentrate these for more efficient secondary treatment. Special attention will be given to the peeling operation in order to reduce the disposable waste.

SUPPORTED BY U.S. Dept. of Agriculture

5.0059, SANITATION, WASTE DISPOSAL AND PEST AND VECTOR CONTROL

H.F. LUDWIG, Engineering Science Inc., Arcadia, California

Technical Objectives: The objective of this work unit is to identify the overall sanitation requirements in the postattack period and purpose procedures for maintaining the health of the surviving population. Develop information on the effects of fallout materials on sewage and waste water systems. Apply all of the above to the five cities study.

Approach: Develop by questionnaire and interview preattack endemicity of significance in each of the five cities and their preattack environmental disease requirements. Evaluate the ability of environmental recovery resources considering various factors that would tend to degrade the system such as fallout and blast and fire damage.

Progress: July 67 - December 67. Methods are being developed which would: (1) permit evaluation of the overall vulnerability of water systems; (2) provide a method of determining the optimal repair vulnerability of water systems; (3) provide a quantitative measure of the effectiveness of repair and recovery efforts. It is anticipated that these concepts would be adaptable to other utilities (sewer, solid waste collection, etc.).

H.F. LUDWIG, Engineering Science Inc., Arcadia, California
(14-12-431)

This work is a laboratory evaluation of potential digester supernatant treatment processes. The study will include the characterization of process waste streams, the summarization and assessment of treatment technology and design and performance criteria for components of a treatment system.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0061, FLOC STRENGTH AND FILTERABILITY OF PRE-TREATED WATER

H.F. LUDWIG, Ludwig Engin. & Sci. Res., Arcadia, California

This study is primarily concerned with the effect of floc characteristics on the performance of rapid sand filters. Floc strength is to be investigated as a measure of flock characteristics. Floc strength will be measured by the degree of floc breakdown after being exposed to a velocity gradient producing shear stress.

The filterability of pretreated water is to be measured by the Silting Index utilizing a membrane filter, by Boucher's Index, and by floc retention capacity of a rapid sand filter.

The effect of pH, alum dosage, coagulant aids, mixing conditions, and lime addition on floc strength will be investigated; their effects on filter performance, expressed by filterability indices, will be studied in pilot plant operation.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0062, EFFECTS OF PESTICIDES ON AQUATIC ANIMALS IN THE ESTUARINE AND MARINE ENVIRONMENT (ABBREV)

R. EARNEST, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Belvedere - Tiburon, California 94920

The objective of the work is to measure acute toxicities of various pesticides to marine and brackish water invertebrates and fishes. The work will be done in the laboratory, in running water aquaria into which pesticides are metered in appropriate amounts. The bioassay work will be organized and conducted so that probit analysis will be used for statistical analysis and comparison. Chemical analysis will be used to monitor amounts of pesticides being tested.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0063, R.I.-MIXING PROCESSES IN ESTUARIES

H.B. FISCHER, Univ. of California, School of Engineering, Berkeley, California 94720

This research will study the underlying processes which cause mixing and dispersion in estuaries through a re-examination of the fundamental mixing and transport processes. A laboratory flume will be used to study the effect of partial stratification on turbulent mixing, both in the vertical and transverse to the main flow direction. In addition, the convective patterns in a simplified model estuary will be observed in detail, in an attempt to combine knowledge of turbulent mixing and convective patterns to predict the overall dispersive pattern. Methods will be sought to predict the values of transfer coefficients in real estuaries, and to show the effect on these coefficients of engineering modifications to the estuary. Results of these studies will be used to improve present methods for forecasting pollutant dispersion.

SUPPORTED BY U.S. National Science Foundation

5.0064, PREPARATION OF MONODISPERSE EMULSIONS

J.L. GOREN, Univ. of California, School of Chemistry, Berkeley, California 94720

The research program has as its principal objective the development of a technique for the preparation of monodisperse emulsions of controlled drop size. The method we wish to exploit is the precipitation of drops from a supersaturated solution of three components onto already existing nuclei. We plan to study the kinetics of nucleation and the size distribution of drops which are formed for several different ways of producing the supersaturation. The results should be of use in many fields of emulsion research as, for example, in the testing of equipment for breaking liquid-liquid emulsions.

5.0065, TRANSIENT LOADING EFFECTS IN THE ACTIVATED SLUDGE PROCESS

D.I. JENKINS, Univ. of California, School of Engineering, Berkeley, California 94720

The current and proposed research is investigating (a) the short-term transient behavior of activated sludge systems in the most significant practical situation in which they occur, i.e., in reactors such as contact stabilization units where deviation from completely mixed conditions exist; (b) the physical properties of activated sludge that influence its removal by sedimentation/clarification and the variation of these properties with organic loading and sludge growth rate; and (c) the chemical, biochemical, and microbiological properties of activated sludge in an attempt to provide a better representation of active solids than the measurement of VSS and to determine the reason for the deviations of activated sludge systems from a theoretical growth model.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0066, TASTES AND ODORS IN WATER SUPPLIES

D.I. JENKINS, Univ. of California, School of Engineering, Berkeley, California 94720

The proposed research is a continuation and broadening of current work concerned with the identification and resolution of the source and nature of odorous compounds in natural waters. Emphasis is on the study of aquatic organisms as one of the major contributors to the problem of taste and odor in waters.

Conventionally the major odor categories include medicinal (phenolic-type compounds), fishy (nitrogen and sulfur-containing compounds), sulfidic and terpenoidal. Papers have been or are in the process of being written on the latter two categories: The sulfidic work involved odors (in descriptive terms) of rotten eggs, skunk, spoiled cabbage, etc., which are associated with simple mercaptans, sulfides and disulfides; the terpenoidal work involves odors (in descriptive terms) of earthy, woody, musty, floral, etc., and includes a variety of essential oils.

The earthy-smelling compounds isolated from blue-green algae and from various actinomycetes are not only the most widespread but also the most troublesome because extremely minute quantities render waters im potable. For this reason emphasis is being directed toward the resolution of the earthy-smelling compounds coupled with the determination of their metabolic production for control aspects.

In addition to developing biological growth units and sampling techniques, microanalytical techniques have been used and developed involving gas chromatography, infrared spectroscopy, mass spectrometry and PMR.

Cooperation with the local water purveyor has enabled an exchange of samples and information on actual reservoir waters.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0067, ORTHOKINETIC FLOCCULATION OF HETERODISPERSED SYSTEMS

W.J. KAUFMAN, Univ. of California, School of Engineering, Berkeley, California 94720

The broad aim of the proposed research continues to be the elucidation of the relationships of the rate of orthokinetic flocculation to the hydrodynamic parameters describing turbulence in stirred reactors. In the present proposal theoretical formulae are presented that relate the rate of flocculation to the rate of energy dissipation and the turbulence spectrum and the rate of deflocculation, or breakup, to similar turbulence parameters and floc strength. It is expected that the establishment of these relationships will lead to the more rational design and operation of the flocculation and precipitation systems employed in water and waste treatment. The principal aim of the proposed research will be to validate these expressions experimentally or to modify them as appropriate to describe the flocculation process under steady-state conditions in stirred reactors. Recognizing that improved flocculator performance may accompany increased rates of energy dissipation only if the flocs are sufficiently strong to resist breakup, a secondary objective will be the investigation of floc strength and particularly those chemical physical factors that may increase the resistance of floc to the shearing forces of turbulence. One of the limited aims of this phase of the research will be the development of a suitable device to measure or provide an index of floc strength.

5.0069, KINETICS OF ALGAL SYSTEMS IN WASTE TREATMENT

W.J. OSWALD, Univ. of California, School of Engineering, Berkeley, California 94720

The objectives of this research are: (1) To study the kinetics of algal and algal-bacterial symbiotic systems in biological waste treatment in relation to variables of substrate concentration (primarily, carbon nitrogen, and phosphorus sources), light exposure, cell concentrations, and applied turbulence on both a laboratory and on an outdoor pilot plant scale. (2) To develop a kinetic model that would incorporate the above variables, and make it possible to establish design parameters with which can be made the rational evaluation and prediction needed in utilizing algal and algal-bacterial systems in biological waste treatment, i.e., in primary, secondary, and tertiary (algae nutrient removal) waste water treatment. (3) Using the kinetic approach, to rationally develop criteria and parameters for use in the design of systems for accomplishing maximum removal of nutrients through assimilation by algae or algal-bacterial biomasses and bringing about maximum photosynthetic production of oxygen, thereby increasing the efficiency of the system, and hence reducing their areal and volumetric requirements in practical applications. (4) Finally, through the development of a rational kinetic model for algal systems, (a) to provide a basis for a more adequate exchange and a clearer interpretation of data on waste treatment and field studies involving such systems than is presently possible, and (b) to arrive at a common denominator in the exchange of information with other scientific groups engaged in studies on systems involving algae.

5.0070, HIGH-PRESSURE VAPOR EXTRACTION OF SOLUBLE ORGANIC SOLUTES FROM AQUEOUS INDUSTRIAL WASTE STREAMS

J.M. PRAUSNITZ, Univ. of California, Graduate School, Berkeley, California 94720

This work proposes to study gas-liquid-liquid phase equilibria in aqueous systems at high pressures using a gas as the extracting solvent. Such equilibria may form the basis of a possible separation process for certain industrial waste streams. By contacting an aqueous solution of organic solutes with a gas (such as ethylene or carbon dioxide) at advanced pressures (vicinity of 600-1000 psia) two liquid phases are formed, one of which is very much richer in the organic solute than the other. Decantation of the two liquid phases is then followed by pressure release to recover the gaseous solvent.

5.0074, A STUDY OF A PROCESS FOR PHOSPHATE REMOVAL FROM WATER SUPPLIES USING LANTHANUM PRECIPITATION

H.L. RECHT, North Amer. Rockwell Corp., Canoga Park, California (14-12-183)

A laboratory investigation of the steps of a new process for phosphate removal from waste water will be performed. This process involves lanthanum precipitation of the phosphate followed by an alkali lanthanum recovery cycle. The purpose of the proposed program is to assess the technical feasibility of the process.

The speed and completeness of phosphate removal, and of each of the other process steps, as well as the extent of lanthanum and other reagent losses, will be determined parametrically in batch laboratory test using both pure solutions and sample water obtained from local treatment plants. From the results of the laboratory investigation, the technical feasibility of the process and an initial estimate of possible process economics may be determined. The results will also serve as a basis for design of an integrated laboratory process demonstration unit, which in turn would provide design data for an actual process demonstration pilot plant.

5.0075, PARAMETRIC STUDY OF THE KINETICS OF PRECIPITATION AND NATURE OF THE PRECIPITATE OBTAINED IN PHOSPHATE REMOVAL USING IRON AND ALUMINUM SALT

H.L. RECHT, North Amer. Rockwell Corp., Canoga Park, California (14-12-158)

The rate of precipitate formation and the physical nature, chemical composition, and solubility of precipitates of phosphate with iron and aluminum under various conditions encountered in wastewater treatment will be investigated. Parameters to be studied include phosphate composition and concentration; pH; T.D.S.; precipitate formation; and stand time, temperature, and degree of agitation of solution during precipitate formation. Tests will be performed on pure solutions, synthetic wastewater ef-

5. WATER QUALITY MANAGEMENT AND PROTECTION

fluents, and with secondary effluent. Results of experimental work will be used to explain the difference between predicted theoretical phosphate removals and actual removals, to identify and explain the mode of action of wastewater components contributing to the difference, and to suggest improved techniques for obtaining more complete phosphate removal by these chemical precipitation methods.

5.0076, DEVELOPMENT PROGRAM FOR TREATMENT OF WASTEWATER BY AERATION

B.L. TUFFLY, North Amer. Rockwell Corp., Canoga Park, California (14-12-434)

To develop the 'U-tube' aeration concept for applications in aeration of sanitary sewer wastewater. This program is considered to be Phase I of a 3-phase program to develop an effective technique, employing the U-tube aeration principle, for aerating sewer wastewater streams. Two applications of particular interest are aeration of secondary effluent from a sewage treatment plant and in-situ aeration in sanitary sewer lines to prevent the formation of anaerobic conditions.

The major tasks for the Phase I study will be a combination of analyses, engineering design studies, and pilot-scale experiments which will accomplish the following: 1. Provide experimental verification of oxygen transfer efficiencies and explore practical aspects of U tube operation. 2. Investigate two major applications: a. Aeration of effluent from sewage treatment plant (design and systems study, not experiments). b. In-situ aeration of sanitary sewer lines.

5.0077, TERTIARY ACTIVATED SLUDGE TREATMENT TO RECLAIM WASTES FOR WATER SUPPLY FOR AGRICULTURAL AND RECREATIONAL PURPOSES

J.R. WRIGHT, Chino City Government, Chino, California 91710

The objective is to demonstrate the performance of a novel treatment method wherein both secondary and tertiary treatment are accomplished with an activated sludge process designed to permit: (1) greatly increased organic loadings; (2) high rates of cell production resulting in a high nutrient removal (nitrogen and phosphates); and (3) greatly reduced plant construction costs. The reclaimed water would be used for recreational and irrigational purposes in the proposed Prado Regional Park, being planned and developed by San Bernardino County. The full utilization of the available water resource in this arid area will help meet the needs created by the development of the Prado Regional Park.

5.0078, SORPTION AND MOVEMENT OF POLLUTED WATER IN SOIL

J.W. BIGGAR, Univ. of California, School of Agriculture, Davis, California 95616

Necessary information linking the reactions between pesticide and soil, and pesticide and plants, to the characteristics of each other, the soil solution environment, temperature and water movement is very spotty and incomplete. Thus this proposal is for a project to obtain a reasonable amount of related information on typical soils and selected pesticides related to fixation and movement. Depending upon the type of soil, organic additive and environment, a number of reactions will determine the extent of movement and persistence in soils. The organic additive may be absorbed by soil, exchanged, absorbed by plants, decomposed into more or less mobile, toxic products, precipitated or leached into ground water, drainage water and streams.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0079, SOILS, PESTICIDES AND THE QUALITY OF WATER

J.W. BIGGAR, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: (1) To establish whether movement through the soil constitutes a significant source of the pesticides found in surface and ground water; (2) To identify the properties of pesticides and of soils that control the extent of movement of pesticides in and through soils; (3) To ascertain the solubility characteristics of pesticides sorbed on soil particles and hence the effect of suspended soil on the concentrations of pesticides in water; and (4) To ascertain the effects of management of pesticides and land on the transport, by all means, of pesticides to water supplies.

Description: Measurements will be made to establish the solubility of materials in aqueous solutions. Adsorption studies at one or more temperatures on soils and clays will be conducted. Diffusion measurements in soil and clay plugs by the use of radioisotopes and miscible displacement experiments involving soil columns will be conducted.

5.0080, CHEMISTRY OF BORON IN CALIFORNIA SOILS

R.G. BURAU, Univ. of California, School of Agriculture, Davis, California 95616

The proposed research will consist of laboratory investigations on California soils which have naturally accumulated various forms of boron in such quantities that the introduction of boron-sensitive plants may be delayed until extensive reclamation is performed.

The objectives are as follows: 1. To determine the boron desorption and adsorption characteristics of several representative high-boron soil profiles and profile segments. 2. To correlate the relative ease of boron desorption with other more easily determinable soil characteristics to serve as a basis for classifying field soils with respect to boron reclaimability. 3. To evaluate leaching treatments and amendments which may reasonably be expected to enhance the rate of boron desorption and/or prevent build-up of toxic soil solution concentrations of boron during reclamation. 4. To determine the forms of boron in various high-boron soils and to evaluate the influence of each form on the rate of boron release.

The main approach will be to determine soil solution boron concentrations as indices of relative plant toxicity as well as to characterize the rate of desorption during repetitive equilibrium extractions and during soil column leaching. This information will be related to chemical and physical characteristics of both the solid and the aqueous phases.

SUPPORTED BY University of California

5.0081, WATER QUALITY IN RELATION TO PHYSICAL AND CHEMICAL PROPERTIES OF SOILS AND WASTE WATERS THEREFROM

L.D. DONEEN, Univ. of California, School of Agriculture, Davis, California 95616

This research proposal is concerned with the relations between soil properties and water quality and between soil properties and quality of its waste water which percolates into underground basins or (re-appears) in surface waters. Several approaches are contemplated to study the major processes and conditions which affect water from the time it is applied on irrigated lands to its removal. The re-usability of the waste water for irrigation and other purposes would depend upon its chemical characteristics.

Proposed studies: 1. Predictions on the solubility of gypsum and lime in water and soil-water systems involving laboratory experiments and computer programming. 2. Predictions on the quality of waters percolating through non-cropped, stratified soil columns and stratified substrata (laboratory and field models, computer programming). 3. Predictions on the distribution of salts in cropped soil profiles and solutes in drainage waters under varying degrees of leaching requirements (laboratory and lysimeter models, computer programming). 4. Re-use of drainage waters from cropped soil profiles (lysimeter studies). 5. Salinity and permeability parameters for agricultural water quality classification scheme (laboratory, lysimeter, and field data).

5.0082, REMOVAL OF STRONTIUM-90 FROM ORGANIC WASTES

M. GOLDMAN, Univ. of California, School of Veterinary Medicine, *Davis, California 95616*

For the past six years a waste treatment facility has been in operation, decontaminating biologic wastes from a colony of Beagles being fed Sr-90-containing diets. The 200 Beagles and the associated cage cleaning procedures generate about 700 gallons of waste per day. Reduction of solids concentration is accomplished utilizing aerobic and anaerobic digestion plus chemical clarification and flocculation prior to pH adjustment and final cationic exchange on Dowex-50.

During 1966 the ion exchange decontamination factor was approximately 3000 in the processing of about 250,000 gallons of waste. The exchange capacity averaged 1.8 mCi of Sr-90/cu ft of resin/3100 gallons of waste processed. Ion exchange is monitored on-line, utilizing a bremsstrahlung counter. Bremsstrahlung counting has been used to detect Sr-90 concentrations of 0.3 pCi/ml. Expended cationic resins are buried, off-site.

5.0083, PREDICTING THE EFFECTS OF CHANGES IN IRRIGATION WATER TEMPERATURE CAUSED BY WATER PROJECTS

R.M. HAGAN, Univ. of California, School of Engineering, *Davis, California 95616*

Construction of reservoirs on rivers flowing from high elevation watersheds will often lead to a lowering of downstream water temperature with possible detrimental effects on irrigated crops. These effects on crop growth and yield cannot be estimated unless the magnitude and duration of the effects of irrigation with cold water on the soil temperature regime are known.

The proposed research plan involves use of a fully instrumented plot in the field to determine the effect of the temperature of irrigation water on soil temperature. The various factors which influence the change in soil temperature resulting from irrigation with cold water -- such as amount and temperature of the applied water, the heat and moisture characteristics of the soil, and weather conditions will be evaluated. These data will be used to check predictions of changes in soil temperature regime following irrigation with cold water. Data will be obtained on the temperature regime on heat and moisture transfer in Yolo loam before, during and after irrigation with water of different temperatures. These include continuous measurement of the soil temperature and of the soil moisture content down to 4 feet below soil surface, as well as measurements of the net radiation and evaporation from the soil surface. Laboratory investigations to determine some of the heat and moisture characteristics of the soil will be made in conjunction with the field experiments.

5.0084, THE ENGINEERING MANAGEMENT OF AGRICULTURAL WASTES

S.A. HART, Univ. of California, Agricultural Experiment Sta., *Davis, California 95616*

Objectives: To develop a philosophy, to research into the fundamentals, and to develop practical technology in the sanitary management of livestock manures, crop residues, and other agricultural wastes.

Proposed work: Work is presently being conducted under USPHS Research Grant EF-265, 'Sanitary engineering applied to livestock manures.' Under this, a manure lagoon experiment, a manure pumpability test, and an activated sludge (aerobic treatment process) stabilization of manure experiment are being pursued.

A USPHS Research Grant application, 'Treating suspended solids in food plant wastewaters,' has been submitted. If approved, studies on the separation of suspended solids from the

wastewater effluent would be conducted. This would be a study on the removal, and on the treatment of both the removed solids and on the remaining effluent.

SUPPORTED BY California State Government

5.0085, SELECTED FACTORS INFLUENCING TASTE OF DRINKING WATER

R.M. PANGBORN, Univ. of California, School of Agriculture, *Davis, California 95616*

This laboratory study of selected factors influencing taste of drinking water has completed an investigation on the effect of solution temperature on the taste threshold, subjective intensity and degree of liking of varying concentrations of sodium chloride. The second phase will involve direct measurement of temperature in the mouth to ascertain the effect of solution temperature on thermal changes at the receptor sites. Additionally, samples of saliva will be collected to determine whether response to sodium compounds is related to the sodium content of the saliva.

The effect of carbonation of mineralized waters on resultant taste quality will be established, followed by studies on chlorinated and fluoridated waters.

5.0086, ANIMAL, FORAGE AND WATER RESOURCES FOR BEEF PRODUCTION

C.A. RAGUSE, Univ. of California, Agricultural Experiment Sta., *Davis, California 95616*

Objectives: (1) To obtain further information regarding animal and plant performance on continuous vs. rotation irrigated pastures. (2) To determine what special problems of irrigation water management may be related to continuous and rotation grazing systems. (3) Preliminary evaluation of animal and plant performance where irrigated pasture is used as a supplement instead of as total intake.

Description of Work Proposed: Land at Davis and at the Sierra Foothill Range Field Station will be used. Grazing experiments at Davis will measure animal average daily gain, carcass gain and quality, forage intake and digestibility and forage botanical composition, availability and utilization. Fractional intake from irrigated pasture will be achieved by using fractional acreages and regulating length and frequency of grazing interval. Feed-lot treatments will be used as controls. Water in the soil profile will be monitored and irrigation amounts and frequencies adjusted to prevent plant water stress. Measurements will be made to determine if differential degrees of soil compaction occur as a result of grazing management. Field Station work will be developmental; project to be revised before active grazing experiments are begun.

5.0090, A METHOD FOR ASSESSING THE EXTENT OF POLLUTION FROM STORMWATER RUNOFF FROM AN URBAN AREA

D.L. FEUERSTEIN, Aerojet General Corporation, El Monte, California 91734

The program will prepare designs of and develop a cost effectiveness evaluation procedure for a number of alternative solutions to storm and combined sewer problems extant at the City of Sacramento, Calif. The program will utilize a systems approach and will be designed to provide a solution to the problem at Sacramento that will have applicability to sewerage systems throughout the nation with similar characteristics. The program will: (1) provide hydrologic bases and waste water compositions for the design of seven candidate systems; (2) develop preliminary plans for each alternative system to assess the costs; (3) estimate construction, operation, and maintenance costs of each system; (4) collate and evaluate data from field investigations so as to provide a maximum national utility; (5) and provide recommendations in the form of a ranking of alternative systems in terms of cost and adverse or beneficial effects on the community.

5.0091, ROLE OF SOLIDS IN COMBINED SEWAGE POLLUTION

D.L. FEUERSTEIN, Aerojet General Corporation, El Monte, California 91734

The program will establish the characteristics of combined sewage that are of significance with respect to solids separation operations and will investigate the feasibility of applying these operations for reduction of pollution from combined sewage overflows. The program consists of the collection and analysis of representative samples from the heterogeneous combined sewage and the conduct of laboratory studies to assess the impact of solids on disinfection practices. Sampling methods provide for determination of gross particle size distribution by screens in situ; thus actual effects of screening on particle coalescence and disinfection, solids separation and retention, and flow disturbance will be integrated into the results.

The sampling program will be performed in San Francisco, Calif.

5.0092, RENOVATION OF MUNICIPAL WASTEWATER BY REVERSE OSMOSIS SYSTEMS

D.L. FEUERSTEIN, Aerojet General Corporation, El Monte, California 91734 (14-12-184)

To perform laboratory-scale investigations to enhance and extend existing knowledge of the reverse osmosis process to waste water renovation applications and to determine operating parameters and relations required for system evaluation and optimization, as set out herein.

Laboratory-scale studies shall be performed using several grades of municipal waste water representing a broad spectrum of effluent qualities.

Except where noted and where necessary to the conduct of this program, flat membrane tests cells shall be utilized.

The laboratory-scale studies shall consist of three separate series of tests designed to elucidate and quantify for the reverse osmosis process the general performance, the effect of suspended solids on performance, and the membrane degradation by suspect compounds.

A mathematical model will also be developed to express the effect of above variables on process performance.

5.0093, DEVELOPMENT OF ECONOMICAL METHODS OF BORON REMOVAL FROM IRRIGATION RETURN WATERS

L.E. GRESSINGH, Aerojet General Corporation, El Monte, California 91734

The purpose of this contract is to perform a laboratory investigation (Phase I) and a field evaluation (Phase II) of methods for the economical removal of boron from irrigation return water in conjunction with the reverse osmosis process.

In Phase I, two or three conventional water treatment processes will be selected, through laboratory studies and cost analysis, as the most promising methods of boron removal for future testing in field scale operation. The purpose of the field evaluation (Phase II) is to develop realistic design criteria and process costs in order to prepare economic estimates of boron removal facilities in reverse osmosis plants of 1, 10 and 50 mgd capacities.

Three removal approaches will be used in this study. They are: by a pretreatment step prior to reverse osmosis processing; by conversion of the boron to a form impermeable to the reverse osmosis membrane; and as a post-treatment operation on the reverse osmosis product stream.

5.0095, REVERSE OSMOSIS TO REMOVE DISSOLVED SOLIDS FROM RENOVATED WASTE WATER USED IN GROUND WATER RECHARGE

D.E. BOEN, Eastern Municipal Water Dist., Hemet, California 92343

The objective of this project is to demonstrate the use of reverse osmosis in reducing the concentrations of total dissolved solids in sewage treatment plant effluents, which are used in a

5. WATER QUALITY MANAGEMENT AND PROTECTION

ground-water recharge program. The reduction is necessary in order to maintain satisfactory concentrations of salts and refractories in ground water despite continuous recycling. Further, the aim is to demonstrate the use of the reverse osmosis unit as an integral element in the total system of water reclamation and reuse required because of the water shortages in an arid area.

The treated effluent, used in the ground-water recharge program, will aid in maintaining the proper balance of water quality in the total water management system.

5.0097, EFFECT OF PHOSPHORUS REMOVAL PROCESSES ON ALGAL GROWTH J.W. SCHERFIG, Univ. of California, School of Engineering, Irvine, California 92664

Increasing eutrophication of surface waters combined with a growing need for recreational water areas necessitate greater concern for removal of biostimulants including the classic nutrients from treated waste water. Major emphasis has been on methods for reducing the phosphorus and nitrogen content in effluents by combinations of chemical and biological processes.

There is however, little scientific evidence indicating that the efficiency of a treatment process in terms of the removal of biostimulants, can be measured only by the degree of phosphorus or nitrogen removal. Organic compounds acting as growth stimulants (such as vitamins) may be produced in significant quantities in traditional biological waste treatment processes.

Because of the complex and little understood phenomenon related to algae blooms, the efficiency of current and proposed phosphate removal processes must be evaluated with respect to the removal of all biostimulants. The research proposed will seek to evaluate the individual steps in a sequence of treatment processes on the direct basis of algal growth in their effluents. It is believed that such information will provide a more rational basis for design of waste water treatment plants.

5.0101, RADIONUCLIDE METABOLISM IN AQUATIC ANIMALS F.L. HARRISON, Univ. of California, Lawrence Radiation Laboratory, Livermore, California 94551 (W-7405-ENG-48)

The rate of accumulation and loss of radionuclides by fish and shellfish is being evaluated to better predict the amount of radioactivity which may be acquired from the consumption of contaminated aquatic animals. Our approach to the problem is to study in depth representative marine and fresh-water animals, to investigate in these animals the metabolism of those elements that are present in significant concentrations and whose radionuclides are produced in nuclear events, and to consider environmental variables that might be expected to affect their radioactive burden. Long-term experiments on the uptake of radionuclides are performed in aquarium systems designed to maintain essentially constant the level of one or two elements. This simulates an environment that might exist downstream from a reactor or from leaching from a large source.

The fresh-water clam, *Anodonta nuttalliana* Lea, has been used as a representative bivalve mollusc. A series of short-term experiments with radionuclides showed that divalent ions such as those of Ca, Mn, Zn, and Co were accumulated in the labial palps, gills, mantle and calcareous tissue. Trivalent ions such as those of Fe, Sc, Eu, and Cr were accumulated in the digestive tract. The uptake of Mn⁵⁴ and Zn⁶⁵ were observed over a period of five months. Uptake rates varied widely in the body parts. The effects of temperature, stable-element concentration and size on uptake rates were evaluated. Increases in temperature and Mn and Zn concentrations resulted in increased uptake rates. In general, the large animals had a lower uptake rate per gram tissue than the small ones.

5.0102, BIOLOGICAL AVAILABILITY OF NUCLEAR DEBRIS TO AQUATIC ANIMALS

F.L. HARRISON, Univ. of California, Lawrence Radiation Laboratory, Livermore, California 94551 (W-7405-ENG-48)

The accumulation of radionuclides from debris from specific Plowshare events is being observed in aquatic animals. Because of their physical or chemical state some radionuclides in debris may be unavailable to animals. This parameter is important to know under conditions where the feasibility of an event is questionable if the activity released were totally available to organisms in the ecosystem.

Debris is added to marine and fresh-water aquarium systems and the levels of specific radionuclides compared in the water and in edible parts of representative aquatic animals in the food chain of man (fish, clams and crayfish or crabs). Concomitant with the balanced aquarium studies, aliquots of the debris are leached with waters from representative ecosystems as controls to determine whether availability changes occur in the presence of the living organisms.

5.0106, BACTERIOLOGY OF BIODEGRADABLE SURFACTANTS

D.A. ANDERSON, Calif. State College, Graduate School, Los Angeles, California 90032

This investigation is concerned with responses of typical Gram negative and Gram positive bacteria when grown in the presence of various molecular varieties of syndets. Representative anionic or nonionic biodegradable surfactants used include: dodecylbenzene sulfonates (linear), ethoxylated alcohols, ethoxylated alkyl phenols, alkyl ether sulfates, taurates, and ricinoleates. Gram negative bacteria used are primarily strains of *Escherichia coli* and *Pseudomonas* spp. Gram positive forms are mostly *Staphylococcus* spp. and *Bacillus* spp.

Gram negatives typically exhibited a temporary inhibition of growth in the presence of certain surfactants followed by rapid proliferation with profuse production of a pervasive slime. Roles of cell membrane leakage, extracellular synthesis of slime, or both, are being studied. Chemical nature of the slime is being investigated. An apparent blocking of phage receptor sites by slime has been observed and is under study. Attention is also being given to effects of the slime on pili and flagella.

With Gram positive bacteria, quite different growth responses have been noted. Non-spore or vegetative cells of sporeformers appear to be uniformly rendered nonviable. Lethal damage to cell membranes or cell walls is under study. In addition to the usual chemical and physical procedures, extensive use is being made of electron microscopy.

5.0107, CHARACTERIZATION OF THE ACTIVATED SLUDGE PROCESS AT THE HYPERION TREATMENT PLANT

A.D. LEIPZIG, Los Angeles Bd. of Pub. Works, Los Angeles, California (14-12-148)

The objectives of the testing program to be carried out at the Hyperion Treatment Plant in Los Angeles can be divided conveniently into two parts. The first objective will be to develop a set of plant characteristics which will represent the average (24 hr. composite) performance of the plant.

The second objective (corresponding to Phase II) will be to study the time dependent or transient behavior of the plant by varying the influent stream in some predetermined way as a function of time and then making measurements of flow and concentration at various stations as a function of time (at one hour intervals). The purpose of Phase II will be to generate the necessary data to develop a dynamic or time dependent mathematical model for the activated sludge process.

The model will then be used to select the most practical method for controlling the plant to achieve improved plant performance and a more uniform water quality at the effluent weirs of the final settler.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0108, ANTELOPE VALLEY WASTE WATER RECLAMATION FACILITY

J.A. LAMBIE, Los Angeles Co. Government, Los Angeles, California

The objective of this project is to demonstrate how waste waters can be reclaimed and utilized for agricultural, industrial, and aquatic recreational purposes. Tertiary treatment facilities will be used to produce the desired quality of effluent. These facilities will include oxidation ponds, chemical treatment, flocculation, clarification and filtration.

5.0109, PHOSPHORUS REMOVAL BY ADDITION OF ALUMINUM TO THE ACTIVATED SLUDGE PROCESS

C. CARRY, Los Angeles Co. San. Dist., Los Angeles, California 90057 (14-12-152)

5. WATER QUALITY MANAGEMENT AND PROTECTION

The objective is to determine the reliability, efficiency and economics of the phosphorus removal process as developed by E. F. Barth and M. B. Ettinger of CWRL. The plan is to divide the three month test period into three month-long tests as follows: 1. First month - Sodium aluminate addition. 2. Second month - Aluminum sulfate addition; lime will be added as necessary to maintain phosphate removal. 3. Third month - Both aluminum sulfate and sodium aluminate addition, the relative quantities being adjusted to maintain the pH at the optimum determined above.

Aluminum dosage in proportion to the phosphorus concentration will be optimized. The aluminum salt solutions will be added to the wastewater before the point of entry of the primary effluent into the aerator.

5.0110, SUPPORT OF THE ADVANCED WASTE-TREATMENT PILOT PLANT AT POMONA, CALIFORNIA

J.D. PARKHURST, Los Angeles Co. San. Dist., Los Angeles, California 90057 (14-12-150)

The objectives of the contract are to allow continuation of studies in order to define cost estimates and operating parameters of the various AWT processes under study.

The pilot plant located at the site of the Pomona, California Water Renovation Plant has been investigating the advanced waste treatment processes since 1964. Investigation of some processes has been continued and others started as the need warranted. Investigations are continuing on absorption on granular carbon, denitrification on carbon and sand, reverse osmosis and ion exchange, among others.

5.0111, EDDY DIFFUSION AND BACTERIAL REDUCTION IN WASTE FIELDS

J.E. FOXWORTHY, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The principal objectives of the proposed work are: 1. To further demonstrate the applicability of previously proposed continuous volume source diffusion models to the dispersion of conservative tracer dye and bacteria within surface waste fields in the sea. 2. To ascertain the effect of the type of submarine outfall on the rate of dispersion of tracer dye and bacteria. 3. To determine, under field conditions, the rates of disappearance of coliform and Fecal Streptococcal Group bacteria. 4. To investigate the effect of vertical mixing combined with radiant energy (sunlight) on bacterial disappearance in surface waste fields.

5.0112, ULTRAVIOLET ABSORPTION IN COASTAL WATERS

R.B. TIBBY, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The proposed work revolves around the basic hypothesis that UV absorbance is a quantitative measure of the extent and dilution of a marine sewage field and that it is directly related to organic load and may be a better index to organic load than BOD.

Improved methods developed during the past year for determining dissolved, particulate and total carbon, and for separating the contributions of organic and inorganic constituents of the waste field and of the background waters, now will be applied in situ and in conjunction with the routine monitoring programs of selected waste disposal agencies in Southern California whose discharge is subject to primary, secondary, or tertiary treatment.

The procedures also may provide information on the rates of biodegradation in the marine environment.

Present studies on the productivity of phytoplankton and benthic algae by oxygen evolution and isotopic carbon uptake will be continued, and will be correlated with the release of extracellular metabolites as determined by UV absorbance.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0113, TERTIARY TREATMENT IN THE PURIFICATION OF WASTE WATER

A.F. BUSH, Univ. of California, School of Engineering, Los Angeles - U.C.L.A., California 90024

Tertiary treatment process using trickling filter and clay coagulation to remove nitrates, phosphates, and biological contaminants from waste water is recommended in order to improve the prospects for wide use of reclaimed supplies.

As population density increases waste disposal must be oriented toward cleaner water with eventual use of reclaimed water rather than disposal.

Modern sewage treatment, like the septic tank, has duplicated many of the natural processes of waste stabilization. The aerobic conditions in the trickling filter and activated sludge systems have improved the process of biodegradation and effectively destroyed the proteins, carbohydrates and fats. The water is then disposed of on spreading grounds, or into streams or oceans.

One of the advantages of soil percolation is that the water is purified by passing through it. The question arises whether a system can be developed which will produce all the results of the natural soil in a water purification process. It is a well established fact that clay in the soil profile removes phosphate and detergent.

It is now proposed that such results might be produced or closely approximated by a sequence of steps in which the trickling filter, followed by clay and alum flocculation unit and sand filter becomes the tertiary step following the algae pond (which in turn follows the activated sludge treatment).

5.0114, A MATHEMATICAL MODEL FOR REGIONAL TREATMENT OF WATER POLLUTION SYSTEMS

G.W. GRAVES, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The aim of this study is a determination of the best integrated regional treatment plan to achieve desired dissolved oxygen goals on an estuary or connected inland waterway. In addition to permitting differential treatment at the polluters this model introduces the options of by-pass piping and piping to central regional treatment plants.

In the first phase, pure by-pass piping was employed to achieve prescribed dissolved oxygen profiles on the Delaware estuary. The solutions obtained in this phase demonstrated that by-pass piping can achieve substantial improvement in heavily polluted sections of the Delaware at modest cost with only slight deterioration in the other sections. The recuperative capability of the estuary, as reflected in the transfer functions, provides a very low cost natural treatment facility when employed intelligently. The dissolved oxygen profile of the estuary is very sensitive to the discharge pattern.

In the second phase, by-pass piping will be combined with differential treatment at the polluter. Unfortunately the combined options generate non-linear constraints in the very large mathematical programming model. Nevertheless, an attempt will be made to obtain actual numerical solutions for the Delaware estuary. The third phase will attempt to determine the optimal number, location, and capacity of regional treatment plants to be employed in conjunction with by pass piping and differential treatment at the polluter.

5.0115, OCEANOGRAPHIC FACTORS IN THE FUNCTIONAL DESIGN OF WASTE DISPOSAL SYSTEMS

J.W. JOHNSON, Univ. of California, Water Resources Center, Los Angeles - U.C.L.A., California 90024

In the design of waste disposal systems, such as ocean sewer outfalls, cooling water waste lines from nuclear power plants, etc., a large variety of technical problems remain to be solved to place such sound design on a sound scientific basis. The three major areas of studies have been: 1. The mixing of a buoyant jet being

5. WATER QUALITY MANAGEMENT AND PROTECTION

discharged horizontally at the water surface. 2. The mixing of a series of buoyant jets being discharged horizontally from both sides of a manifold placed at the bottom of a tank. 3. The mixing caused by the mass transport associated with surface waves having a circular normal directional spectra.

The laboratory work done previously at UCB in regard to Item 1 was re-examined, and compared with the results of work done subsequently by other institutions. These results were then compared with the two sets of prototype data with which the investigators were aware: The Pacific Gas & Electric Plant at Morro Bay, California, and the discharge of the Columbia River into the North Pacific Ocean. The data compared favorably, on a gross basis. It became evident that the laboratory work should be extended to much smaller values of Froude number and that the statistical fluctuations of temperature and salinity in the mixing jet should be studied in detail.

In regard to Item 2, the results of the studies of single jets by a number of investigators were compared, and a preliminary report written on the findings. It was evident that no additional work need be done on the portion of a single jet between the bottom and surface, but that there is essentially no information on the interaction of multiple jets from a manifold. The laboratory equipment has been designed, constructed and tested, with preliminary tests made.

The results of a theoretical study of Item 3 have been negative, in the sense that there appears to be no mixing caused by the mass transport of waves with a circular normal distribution. However, the theoretical study was linear, and there may be some non-linear mechanism that exists.

5.0116, MARKETS TO 1980 FOR WASTE WATER TREATMENT AND RENOVATION FACILITIES

R.E. DELARUE, Stanford Research Institute, Menlo Park, California

The overall objectives of the study are (1) to identify markets whose growth will offer business opportunities to suppliers of equipment, chemicals, materials, and services for waste water treatment; (2) to establish a timetable for the growth rates of these markets; and (3) to identify business strategies through which companies can successfully penetrate the markets. Specifically, the objectives are to:

1. Forecast the markets of 1980 for both municipal and industrial waste water treatment facilities that will be required for treatment of waste water either for release or reuse; including cooling towers.

2. Forecast the markets to 1980 for equipment (including instrumentation) and services for both municipal and industrial facilities.

3. Forecast the markets to 1980 for chemicals, materials, and supplies that will be consumed in the operation of municipal and industrial facilities.

4. Evaluate the effects of anticipated government legislation, policies, and expenditures on the markets for waste treatment and renovation.

5. Identify and analyze the criteria necessary for sponsors to compete successfully and profitably for these markets.

5.0118, HYDROLOGY OF CACHUMA RESERVOIR

E.R. HEDMAN, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

The objective of this project is to evaluate proposed air-injection systems to minimize thermal stratification in large reservoirs in order to (1) increase the dissolved oxygen content of the deep water, (2) prevent the development of dissolved hydrogen sulfide and other sources of bad taste and odor, and (3) reduce the concentration of phytoplankton populations in water to be withdrawn and treated for domestic use. The chemical and biological effects of air injection in lake water will be studied. Field and laboratory experiments will be conducted to study the effects of air injection in a controlled environment. The changes in phytoplankton populations, water quality, and temperature will be studied with varied thermal stratification.

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of California.

5.0119, CHEMISTRY OF HYDROSOLIC METALS IN NATURAL WATER

J.D. HEM, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

Certain metallic elements readily precipitate as oxides or hydroxides at the pH and redox potential normally occurring in aerated natural water. The most common of these elements, iron, manganese, and aluminum are being studied under this project.

One aim of the research project has been to provide a more complete understanding of the factors affecting solubility of iron and manganese in natural water so that the problems of removal from water supplies can be approached more logically.

Phases 1 and 2 of this project, the study of iron and manganese chemistry respectively, have been completed. Phase 3, concerned with aluminum chemistry, is in progress.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

5.0120, ORGANIC SUBSTANCES IN WATER

W.L. LAMAR, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

Wide and complex varieties of organic substances are present in water and the number of the organic pollutants reaching water supplies is rapidly increasing. Knowledge of the extent, character, and composition of organic substances in water has lagged significantly behind that of the mineral components.

The work involves largely the development of methodology for the separation, identification, and measurement of organic substances in water. The initial work has been concerned with natural organic substances in water. The processes being developed basically involve extraction, vacuum evaporation, chromatography, and infrared spectroscopy.

The development of highly sensitive techniques for the separation, identification, and measurement of pesticides in water will be continued. Recovery studies will be continued and extended to cover additional pesticides to those already investigated. Efforts will also be directed toward the development of an electron capture gas chromatographic procedure for the analysis of chlorinated phenoxy acid herbicides and their derivatives in water.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

5.0121, HYDRODYNAMIC STUDIES FOR ELECTRODIALYSIS

G.A. GUTER, McDonnell Douglas Corporation, Newport Beach, California

The scope of work will be directed toward improving the electro dialysis process through a study of the hydrodynamic fac-

5. WATER QUALITY MANAGEMENT AND PROTECTION

tors associated with the mass transfer of electrolytes from dialysate to concentrate streams. Recognizing the importance of spacer design on the electrodialysis process, Astropower Laboratory is developing experimental techniques to study spacer hydrodynamics in actual stack configurations. A unique photographic technique has been developed which gives accurate and rapid measurements of local flow velocities of electrolyte over the surfaces of membranes and is able to detect regions of stagnant flow and the relationship of these regions to a given spacer design. The Douglas hydrostatic channel, designed especially for hydrodynamic studies on scale models, is also applicable to spacer studies and will obtain three-dimensional flow patterns and velocities in simulated electrodialysis channels. Local current density measurements such as the shadowing effect of spacers will also be evaluated. The research program will study the hydrodynamic effects of a number of spacer designs now in common use. Beyond that, new spacer designs will be evaluated and an optimum design will be determined. These experiments will include studies with large size membranes and spacers used in pilot plants of high capacity. Work with laboratory size apparatus is also included.

5.0122, ORGANIC MATTER AND ITS ROLE IN WATER QUALITY

J.J. CONNORS, East Bay Municipal Util. Dist., Oakland, California 94623

An investigation of the sources and effects of organic matter in a complex metropolitan water system with the goal of defining the bases on which controls may be economically exerted to reduce the organic content of water to an acceptable level. Consideration to be given to raw water reservoir management for this purpose, in the context of multiple use, and to the removals effected by coagulation and filtration. Later phases to recognize the qualitative differences in the maintenance of water quality.

5.0123, ENGINEERING INVESTIGATION OF STORM WATER INFILTRATION INTO SANITARY SEWERS OF THE EAST BAY MUNICIPAL UTILITY DISTRICT

J. WHITE, Metcalf & Eddy, Palo Alto, California

Sanitary sewage flows from Oakland, Berkeley, and other cities in the East Bay area are treated and disposed of through facilities of the East Bay Municipal Utility District. During periods of rainfall, stormwater gains access to the sanitary sewers, through infiltration and other means, causing overflows in the system and by-passing of the treatment plant resulting in pollution of San Francisco Bay. The work includes the selection of specific areas for intensive study, the installation of flow measuring and sampling equipment as well as raingages to obtain detailed information on the quantity and quality of storm flows as related to storm patterns, the development of alternate solutions for control of pollution, development of generalized cost data, and preparation of preliminary plans for recommended solution. Procedures include the relating of storm flows to system characteristics, rainfall, geological and geographical conditions, and land use; development of techniques for extrapolation of subarea data to whole system by systems analysis, quantitative effects on receiving waters, and cost effectiveness of various solutions. Information will be presented in a form that can be adapted for use at other localities.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0124, FURTHER STUDIES OF INFILTRATION

J.B. FRANZINI, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

Several aspects of unsteady and unsaturated flow in soils are under analytic and experimental investigation. Numerical procedures for analyzing moisture movement in soils have been developed for both one-dimensional and two-dimensional flow. The impedance of infiltration by pressure built-up of trapped air has been investigated. The effect of an applied pressure on horizontal flow in soils has been examined.

Future work will include an investigation of two-dimensional flow with a variety of impermeable barrier configurations. This work should lead to a better understanding of soil moisture movement which has many important applications such as: infiltration and its effect on runoff, the operation of underground drainage fields, the disposal of waste water through surface spreading, groundwater recharge, and other environmental problems.

5.0127, STRUCTURE OF THE BLUE-GREEN ALGA TOXIN

B. WEINSTEIN, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

For the past three years I have been working on the synthesis of a polypeptide hormone (glucagon), as well as methods for the gas chromatographic and mass spectral analysis of polypeptides. I would like to apply these techniques to the determination of the structure, and the possible synthesis of the blue-green alga toxin. At a later date, I wish to undertake the synthesis of the cyclic polypeptides malformin, phalloidin, enchinomycin, and spirodesmin, each of which is a toxic produce. In the structural area, I plan ultimately to study cobra and rattlesnake venoms. It is felt that a coordinated research effort in the area of polypeptide structure and synthesis can yield many scientific dividends, in both the organic and biochemical fields.

5.0129, THE CHEMISTRY OF MAGANESE IN NATURAL WATERS

J.J. MORGAN, Calif. Inst. of Technology, School of Engineering, Pasadena, California 91109

The long-term goal of the proposed research is to provide as complete a description as possible, in chemical terms, of the behavior of manganese, iron, and related elements in natural waters and in water treatment processes. The research plans to obtain a kinetic description of the processes believed to be of major significance in natural water systems where manganese and iron are significant constituents.

Four specific problems are emphasized: (i) The kinetics of the oxidation of manganese by chlorine; (ii) the role of organic ligands and reductants in determining the kinetic behavior of the system $Mn(II) - O_2$; (iii) the influence of various mineral surfaces on the kinetics of $Mn(II)$ oxygenation; and (iv) the colloid- and surface-chemical properties of hydrous manganese oxides, particularly MnO_2 .

5.0130, MARINE WASTE DISPOSAL AND SEA URCHIN ECOLOGY

W.J. NORTH, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109

Southern California communities are growing rapidly and depend intimately on the ocean for food, recreation, and waste disposal. At times the varied human activities seriously interfere with each other and with the natural environment. Unless preventive measures can be developed, metropolitan growth will clearly disrupt nearshore ecology to the point where few marine biological resources will survive. Our broadest objective is to alleviate this situation to the greatest extent possible.

The principal area of our concern has been the California kelp beds because their great extent, high productivity, and richness of species and biomass plainly marks them as regions of singular importance. Our overall research program is divided into two sections; one section emphasizes development of techniques for controlling and improving kelp communities while the other concentrates on gathering basic ecological knowledge that provides the background for intelligent control. This proposal is in the second category. Interactions between these two sections are outlined in an addendum enclosed herewith.

One of the chief factors affecting the kelp communities adversely is apparently an imbalance resulting from overgrazing by sea urchins. We suspect that there is a nutritional link between discharged sewage and the dense urchin populations. The proposed investigation should confirm or disprove the existence of the suspected link. If such a relation is verified, future planning of many seaside municipalities will benefit from the information.

5.0131, TREATMENT OF MUNICIPAL SECONDARY EFFLUENT BY REVERSE OSMOSIS

A.N. MASSE, Los Angeles Co. San. Dist. 21, Pomona, California

Reverse osmosis through a cellulose acetate membrane is being investigated as a process for removing dissolved inorganic and refractory organic materials from a municipal secondary effluent. A 5,000 gpd unit, using the spiral membrane configuration, manufactured by the General Atomic Division of General Dynamics Corporation has been run at 400 psi on secondary effluent passed through a 10-micron filter and on secondary effluent passed through a column of granular carbon for removal of dissolved organic material. The secondary effluent receiving only a filtration pretreatment both fouled and plugged the membranes and the feed channels. Considerably more success was obtained when the unit was fed carbon-treated secondary effluent. Over 80% of the 4,000 gpd feed is recovered as product having a TDS of less than 50 ppm and a COD of less than 5 ppm. A similar study

is in progress on a fiber-glass tube unit supplied by Havens Industries. The results are similar but troubles have been encountered because of tube rupture.

5.0132, BIOLOGICAL REMOVAL OF THE NITRATE ION ON BEDS OF ACTIVATED CARBON OR SAND

A.N. MASSE, Los Angeles Co. San. Dist. 21, Pomona, California

It has been discovered that denitrifying bacteria can be made to flourish on beds of granular media and that these bacteria can reduce the oxidized inorganic nitrogen forms to gaseous nitrogen. Methanol is added to the feed stream to serve as a food source to the bacteria. About 1 milligram of nitrate-nitrogen is reduced by 2 milligrams of methanol. NO_3-N can be reduced to less than 1 mg/l by addition of the proper amount of methanol. Studies have been underway using both activated carbon and sand as the media. Contact times less than 10 minutes have proven adequate. The media must be backwashed frequently, but backwashing does not disturb the denitrifying properties of the media. Other studies are in progress to determine the suitability of waste products in place of the methanol.

5.0133, TREATMENT OF MUNICIPAL SECONDARY EFFLUENT BY GRANULAR ACTIVATED CARBON

J.D. PARKHURST, Los Angeles Co. San. Dist. 21, Pomona, California

The objective of the project is to develop economic and design information on the application of granular activated carbon to removing the refractory organic materials from a municipal secondary effluent. The equipment consists of four 6-foot diameter, 10-ft. deep beds of 16 X 40 mesh carbon over which the secondary effluent is passed downflow at a rate of 7 gpm/ft². The total flow is 200 gpm. The product COD is maintained between 3 and 12 ppm by thermal regeneration of the exhausted carbon in a 6-hearth Herreschoff furnace. The carbon exhaustion rate has been about 3500/mg. Carbon losses per cycle have been between 7-1/2 and 10% but it is believed that this would be reduced to 5% in a larger-scale operation. A cost estimate for a 10 mgd plant indicated that total costs would be about 8 cents/1,000 gal. Studies have shown that, between 4 and 10 gpm/ft², contact time alone is controlling. Studies are underway to determine the effect of application rates below 4 gpm/ft² and to evaluate the effect of particle size and source of carbon.

5.0136, TOXICITIES OF CATIONS VS. ANIONS ACCUMULATED FROM SALINE SOILS

F.M. EATON, Univ. of California, School of Agriculture, Riverside, California 92502

Uncertainty has existed for many years as to whether the reduced growth of crops on saline soils is due primarily to the extra accumulations in plants of the cations (Ca, Mg, Na, K) or of the anions (SO₄, Cl, and NO₃); both are accumulated simultaneously. With knowledge in the foregoing regard, substantial advantages would be gained in appraisals of the relative values of water supplies and in estimates of the growth reductions that are associated with the types of salt found in soil solutions. With this knowledge, research can be focussed on the individual ions of the group that is primarily responsible for salt toxicity.

Relatively high concentrations of SO₄, or of Cl, are found to accumulate in plants -- without important changes in the sum of cations -- when SO₂, or hydrogen chloride, is supplied atmospherically to plants growing in plastic cabinets. The current research is showing growth depressions far below those of plants accumulating similar concentrations of SO₄, or Cl, from saline substrates.

5.0137, DEVELOPMENT OF ANALYTICAL METHODS FOR PESTICIDE CONTAMINANTS IN DOMESTIC, IRRIGATION AND POND WATERS

F.A. GUNTHER, Univ. of California, School of Agriculture, Riverside, California 92502

The quantitative estimation and qualitative identification of pesticides will be investigated using various detection devices including the phosphorus and sulfur detectors for the gas chromatograph and the emission spectrometric detector. Investigations to develop methods for specific pesticides of interest and studies to determine the water solubilities of organochlorine pesticides will be continued.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

5.0138, PESTICIDES AND WILDLIFE

F.A. GUNTHER, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

The objectives of this project are to study the relationship of insecticides to wildlife species, and to develop specific public health insect control measures in wildlife habitats, with the hope to eliminate or diminish hazards to non-target species.

The productivity, food chain relationships and biological characteristics of predominant components of the eco-system will be investigated with the introduction of commonly used pesticides. Degradation and detoxification avenues and mechanisms in a variety of habitats and organisms will be elucidated. Residues of insecticides in water, surface and sub-soil strata, aquatic vegetation and non target organisms by means of gas chromatography. Colorimetric procedures and other appropriate analytical methods will be studied. The biological and toxicological effects of insecticidal treatments influencing animal populations in the treated area will be investigated.

SUPPORTED BY California State Government

5.0139, DEVELOPMENT OF ANALYTICAL METHODS FOR PESTICIDE CONTAMINANTS IN DOMESTIC, IRRIGATION, LAKE, AND POND WATERS

F.A. GUNTHER, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

Objectives: 1. Develop dependable, quantitative extraction procedures for removing pesticide residues from samples of water. 2. Develop methods of analysis that will identify and measure pesticides present, and that are sufficiently sensitive to permit the use of smaller samples than are now required (e.g., 5-10 l. rather than the 1,000 l. and larger samples now employed). These methods would apply equally well to the analysis of soil samples. 3. Automate the analytical procedures as far as practical to achieve maximum output per man-hour.

Work Proposed: Procedures for extracting pesticide residues from water that will give consistent, essentially complete recovery will be developed. Carbon columns and other adsorbing media will be investigated, as well as counter-current partitioning procedures.

Analytical methods, and particularly instrumental methods that are susceptible to automation, will be developed and adapted to use for water and soil analysis. An important objective will be the development of methods of sufficient sensitivity to permit the use of relatively small water sample and thus eliminate the necessity for complicated sampling devices and adsorbents that only too frequently introduce errors that are difficult to detect and eliminate. By utilizing the latest developments in instrumentation, the two objectives of sensitivity and automation may both be achieved.

5.0140, SORPTION AND DESORPTION FACTORS INFLUENCING TRANSPORT, PERSISTENCE, & ALTERATION OF PESTICIDES IN VARIOUS AGRICULTURAL SOILS

H.P. HERMANSON, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

To identify the properties of pesticides, of soils, and of soil water that control the extent of sorption, movement, alteration, and persistence of pesticides in soils; to establish the solubilities of pesticides sorbed on soil colloids and thus the importance of any 'solubilization' effects of this colloidal reservoir. There is insufficient information concerning the effect of soil factors on the occurrence of pesticides in soil water. The partitioning of several classes of pesticides between soil and soil water will be measured by radioactive tracer techniques over a range of water availability. Soil properties such as organic carbon content, cation-exchange capacity, anion-exchange capacity, specific surface, etc. will be determined on selected California soils. The relationship between the adsorption and desorption data and the soil chemical and physical data will be described and rationalized. This knowledge will aid in the efficient designing of experiments to test practical methods of reducing pesticide pollution in water, soils, and crops growing therein.

5.0141, INVESTIGATIONS ON NEW INSECTICIDES AND TECHNIQUES FOR THE CONTROL OF PEST AND VECTOR MOSQUITOES

R.L. METCALF, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

Laboratory and field investigations of more than 800 compounds as toxicants for larval and adult mosquitoes during the past year showed that 18 materials were very promising for field control. Seven new materials, previously selected for laboratory experiments, were field tested against *Culex tarsalis*. As a result of this program there are now 10 new materials which could be substituted for parathion in larvicidal operations.

Work proposed will include the continuation of the following projects: Twenty-eight new larvicidal compounds were evaluated against the top minnow, and several species of frogs for potential

5. WATER QUALITY MANAGEMENT AND PROTECTION

damage to wildlife. The residue persistence curves for alfalfa treated with parathion and Baytex were evaluated using sprays and granulars. The latter caused no detectable residues on the hay. The relative penetration of vegetative plant cover by granulars and sprays was compared. Granular formulations were found to be superior.

SUPPORTED BY California State Government

5.0142, RECOVERY OF METAL SALTS FROM CONCENTRATED BRINES BY CHELATION CONTRACT NO. 14-01-

D.O. DEPREE, Aerojet General Corporation, Sacramento, California

The objective of the proposed work is to establish the feasibility of recovering potable water and marketable metal salts in relatively pure form, from concentrated brine solutions by employing a regenerative chelation process.

The process under investigation includes the removal of salts from solution by the use of exchange resins and the recovery of the metal ions and regeneration of the exchange resin by reaction with selective chelating agents. The program includes (1) the synthesis of chelating agents for sodium, calcium, magnesium, and potassium, (2) the evaluation of these chelating agents both for selectivity and in regenerating ion exchange resins, and (3) the evaluation of solvents for their effect upon the efficiency of the chelatin step. The overall process will be demonstrated in the laboratory including the demineralization of a synthetic concentrated brine containing the four metal ions under study with a selected commercial ion exchange resin, regeneration of the resin with chelate solutions and recovery of the chelates by acid treatment.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

5.0143, AMERICAN RIVER HYDROBIOLOGIC POTENTIAL STUDY

L.W. HOM, Sacramento State College, Graduate School, Sacramento, California 95819

Purpose: To predict the hydrobiologic potential of the Lower American River for present and ultimate flow conditions. This study will consider the production of phytoplankton organisms (algae), and their effect on the water quality. The phases of this investigative study are: 1. Develop a sampling and analysis program to assess the hydrobiologic quality of waters of the Lower American River. 2. Identify, enumerate and determine biomass of organisms present in water samples. 3. Identify statistically significant hydrobiologic parameters and develop general relationships to describe existing conditions and to predict future conditions.

The evaluation of algal growth potential (AGP) on selected samples will be performed using the Skulberg Method (1966). This consists of determining the maximum growth rate or maximum cell numbers during an incubation period under controlled light, temperature and nutrient conditions.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0144, COMPLEMENTARY - COMPETITIVE ASPECTS OF WATER STORAGE

K.B. MERRI, Sacramento State College, Graduate School, Sacramento, California 95819

An engineering-economic investigation is to be conducted of the complementary and competitive aspects of the storage of water for water quality control. The DYNAMO computer program will be employed to simulate a river basin. Hydrologic information for Holley Reservoir in Oregon has been simulated and other available information on Holley will be used to determine the cost and benefit functions. Determination of the extent and magnitude of the complementary and competitive aspects with other benefits will be scrutinized while searching for the conditions which maximize the net benefits from the reservoir. Benefits include flood control, channel improvement, irrigation, water quality control, downstream fisheries and recreation in the vicinity of the storage reservoir. A model will be developed that will produce a rational analytical approach to the evaluation of the

magnitude and extent of the competitive and complementary aspects of storage for water quality control. Results obtained from this investigation should help water management agencies estimate the benefits from water stored for water quality control, guide benefit evaluation studies, and indicate areas needing further research. This model is not intended to be definitive of Holley reservoir, but is developed to accomplish the aims of this research proposal and in order that it be useful for water resource projects of this general nature.

5.0145, DOCUMENT LOGGING DAMAGE

J.W. BURNS, State Dept. of Fish & Game, Sacramento, California

Objectives: To determine the type, extent, and duration of conditions in natural and logged streams.

Procedure: Study programs will be surveyed periodically to determine the physical, chemical, and biological changes which occur naturally or are the result of logging. This entails measuring conditions and populations before, during, and after logging, and surveying streams previously logged. The methods to be developed and tested in Job 1 will be used concurrently in these surveys. Attempts will be made to correlate habitat changes with changes in fish populations.

5.0146, EFFECTS OF INCREASE IN SALTON SEA SALINITY ON THE SURVIVAL OF ORANGEMOUTH CORVINA, SARGO, BAIRDIELLA, AND NEANTHES

R.F. ELWELL, State Dept. of Fish & Game, Sacramento, California

Objectives: To determine the effect of various concentrations of Salton Sea salts on the important fishes and food chain organisms.

Premises: The Salton Sea is a valuable sportfishing resource. Based on projections, angler days use in 1967 will total approximately 660,000. Their catch will total approximately 1,000,000 fish. This resource is being jeopardized by increasing salinities. It is estimated that 1,750,000 tons of salts will have to be removed annually to maintain present salinities. However, the beneficial uses of the Salton Sea may be preserved by employing suitable engineering methods to maintain constant salinity levels. It is necessary to know the salinity tolerances of the important fishes and invertebrates so that appropriate salinity levels can be recommended to the agencies responsible for controlling the water quality of the Salton Sea.

The salinity tolerance limits can be determined for the orange-mouth corvina, sargo, bairdiella, Neanthes, and other organisms by laboratory bioassays, and then be applied to the Salton Sea.

Procedures: Exploratory tests will be conducted to determine the approximate range of concentrations which should be covered in full-scale tests. The test range to be used in the full-scale routine tests should be between the highest concentration at which all fish survive for 96 hours and the lowest concentration at which all fish die in 24 hours. The probable concentrations to be used in the exploratory tests are 44, 53, 62 and 70 percent. Once the critical concentration range has been determined, more specific tolerances will be measured by testing a series of four concentrations within the limits of this range.

5.0148, STUDY AND EXPERIMENTS IN WASTE WATER RECLAMATION BY A REVERSE OSMOSIS PROCESS

T.J. LARSON, General Dynamics Corporation, San Diego, California (14-12-181)

To provide two reverse osmosis test units for operation at the Pomona, California, test facility of the County Sanitation Districts of Los Angeles County. Each unit will be capable of simultaneously testing 54 one-ft-long, spiral-wound reverse osmosis modules or 18 three-ft-long modules.

Conduct a comprehensive series of field-test experiments in the two units to examine the influence of various test parameters on system performance. Perform direct support of the field experiments as required, and conduct laboratory experiments and investigations to support the overall program.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0149, MEMBRANE MATERIALS FOR WASTE WATER RECLAMATION BY REVERSE OSMOSIS

H.K. LONSDALE, General Dynamics Corporation, San Diego, California (14-12-452)

Three new types of reverse osmosis membranes will be prepared and tested to determine whether they have advantages over conventional cellulose acetate membranes for treatment of wastewater. The three membrane types are cellulose acetate with acetyl contents different from conventional membranes, polyvinyl-pyrrolidone-polyisocyanate, and membranes formed from polymer dispersions or latices. The object of the work is to obtain membranes with high flux, high organic rejection, and inorganic rejections at least sufficient to remove the increment of minerals added to water during use.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0150, LEAD ISOTOPIC CHEMISTRY FOR POLLUTION RESEARCH

T.J. CHOW, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The main objectives of this project are (1) to conduct basic research on the isotopic chemistry of lead in various environments, and (2) to establish the applicability of using stable isotopes as tracers for air and water pollution studies.

The isotopic composition of lead in potential pollution sources such as gasoline, oil and gaseous fuels, coal and industrial chemicals will be monitored to determine the trends of lead isotopic composition variations. After having established their isotopic compositions in the source materials, the lead isotopes in the water and air pollutants such as urban aerosols, river and harbour waters, industrial wastes, sewage and other samples will be determined. By evaluating and correlating isotopic composition of leads in the source materials and in the contaminants, the transport mechanism of the pollutants will be elucidated.

The distribution of lead isotopes in the 'natural' environment will be studied by sampling air, rain and sea water away from 'apparent' industrial contaminations. This part of sampling program can be carried out at the 'uncontaminated' mid-ocean regions aboard research vessels during oceanographic expeditions. These results will establish the 'ground level' of lead pollutants and serve as the basis to evaluate the degree of contamination in the urban and industrialized regions.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0151, DISPERSION OF WATER AND SEDIMENTS IN THE SURF ZONE

D.L. INMAN, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038

Field and laboratory studies of dispersion in and near the surf zone. The object of the study is to relate the diffusion coefficients of water and sand to the wave parameters so that the movement of possible beach contaminants may be estimated from a knowledge of the beach location and its wave regime.

Field investigations are conducted on a variety of beaches having different sand size and exposure to waves.

Project funding commenced fiscal 1966-67; it is anticipated that the study will be complete in December 1968.

SUPPORTED BY California State Government

5.0152, A DEMONSTRATION PLANT EVALUATION OF FOUR METHODS FOR PULP AND PAPER MILL SLUDGE UTILIZATION AND DISPOSAL

H. AMBERG, Crown Zellerbach Corporation, San Francisco, California 94119

This demonstration study is a full-scale investigation of four methods of utilization and disposal of primary sludge from a combined pulp and paper mill. The areas of investigation are: disposal by incineration, utilization as 'hog-fuel' make-up in a conventional steam boiler at rates ranging between 5 and 50%, use as a dried mulching material for highway slope preparation and the evaluation of sludge as an agricultural soil conditioner.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Crown Zellerbach Corporation

5.0153, TREATMENT OF COMBINED SEWER OVERFLOWS BY THE DISSOLVED AIR FLOTATION PROCESS

R.C. LEVY, San Francisco Dept. Pub. Wks., San Francisco, California

The Project consists of the design, construction, operation, and evaluation of a dissolved air flotation facility for the treatment of combined sewer overflows from the Baker Street Outfall in the City and County of San Francisco.

Features of the facility include: Dissolved air flotation to remove both particulate and liquid floatables found in the combined sewer overflows. Developmental studies have shown that 80 to 90 percent of the total hexane extractable materials in combined sewer overflows can be removed by dissolved air flotation. Excellent reductions in other pollutional parameters (COD, BOD, SS, etc.) have also been demonstrated on a laboratory scale.

Sedimentation to reduce the quantity of materials which cause accumulation of sludge banks in receiving waters. Elimination of these materials will prevent formation of floatable debris due to slow fermentation and subsequent flotation of accumulated deposits.

Chlorination to disinfect the overflows. By reducing the number of indicator organisms in the receiving waters to a safe level, standards requisite for recreation will be preserved.

In addition, coarse trash racks will be installed to remove large objects which might otherwise damage the treatment facility.

5.0154, REUSE OF WASTE IRRIGATION WATER TO RECOVER ADDITIONAL PETROLEUM BY WATERFLOODING

G.L. GATES, U.S. Dept. of Interior, Petroleum Research Off., San Francisco, California 94111

The proposed research plan involves laboratory and some field investigations to determine the suitability of waters, particularly waste irrigation waters, for use in obtaining additional petroleum from semidepleted reservoir rocks. The main plan is to study mixtures of waste irrigation waters with waters produced from petroleum reservoirs. If harmful precipitates that may plug petroleum reservoir rock flow channels are formed, the precipitates will be identified chemically and physically. Necessary treatment methods will be devised.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Laboratory investigations will utilize the flame spectrophotometer to determine the chemical constituents of the waste irrigation waters and the waters occurring with the petroleum in the reservoir rocks. In a similar manner, the chemical constituents of harmful precipitates formed in mixing these waters will be determined. The physical forms of the precipitates will be identified using the Differential Thermal Analysis equipment and the petrographic microscope. The effect of these waters on the permeability of reservoir rocks will be determined.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

5.0155, BOD, SOLIDS AND NUTRIENT REMOVAL FROM SECONDARY EFFLUENT BY FOAM FRACTIONATION **F. BELICK, San Jose City Government, San Jose, California**

The objective of this project is to demonstrate the effective removal of secondary effluent solids, Biochemical Oxygen Demand, and nutrients such as nitrates and phosphates by a Foam Fractionation System, to be located at the San Jose - Santa Clara Water Pollution Control Plant. The aim is also to determine full-scale design and operating criteria in order to comply with required BOD and solids reduction and to attain optimum phosphate and nitrate removal. The successful demonstration of the System will provide one of the first systems that will economically remove solids, BOD, and nutrients from a waste water facility in one continuous process. Such a system would be applicable to a wide range of waste discharge volumes.

5.0156, PROCESS TO REMOVE CARBONACEOUS, AND PHOSPHORUS-MATERIALS FROM ANAEROBIC DIGESTER SUPERNATANT AND RELATED PROCESS STREAMS

H.A. OLDENKAMP, F M C Corporation, Santa Clara, California (14-21-414)

A process will be developed to remove plant nutrients and COD materials from digester supernatant liquors. The sequence of operations to be studied involve (a) heating to remove CO₂, (b) addition of lime to precipitate phosphates and to coagulate organic matter, (c) stripping the alkaline slurry with air to remove ammonia, (d) settling the sludge to separate phosphates and COD material, and (e) recovery of the ammonia stripped from the alkaline slurry by scrubbing the air-ammonia mixture with sulfuric acid. From this work, a portable and proven pilot plant will result and estimates of plant costs developed for treating up to 3 MGD of supernatant liquors.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0157, CANNERY WASTE TREATMENT BY THE KEHR ACTIVATED SLUDGE PROCESS **W. PALMER, Santa Clara City Government, Santa Clara, California**

The Kehr Process, in essence, involves a combining of activated sludge aeration of 10,000 to 15,000 mg/l mixed liquor solids with aerobic digestion in a single aeration tank. This provides high removals of BOD, solids, and nutrients; facility for periodic high strength wastes; a stabilized, drainable water sludge; and comparatively low physical plant costs.

The objectives are to: 1. Demonstrate the revised Kehr Process using liquid-solids separation by high-rate flotation-denatification system of activated sludge solids. 2. Demonstrate effectiveness of the process for treating cannery wastes combined with domestic sewage having a BOD 5 of 1000 to 2000 mg/l. 3. Demonstrate performance of the process with densified return sludge solids of 4% to 8% on a dry weight basis, thus affecting plant economy by use of smaller tankage volume. 4. Determine processing requirements for application to a full-scale treatment plant.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Santa Clara City Government - California

5.0158, RENOVATION OF WASTE EFFLUENT FOR RECREATION AND POTABLE WATER SUPPLY USE **R.L. STOYER, Santee County Water District, Santee, California 92071**

The immediate objectives of the project are to demonstrate that the effluent from a recently constructed activated sludge plant can be treated through biological, mechanical, and chemical means so that the resulting effluents can then be safely used for body contact sports and other recreational activities. It will also demonstrate the elimination of bacteria and viruses. The value of this project is enhanced by the environmental characteristics of the area. Santee is an arid region, having high rates of evaporation and a water supply shortage. At present, shortage is met by importing water. With increasing populations and rising costs of imported water, Santee and other similar communities must develop supplemental water supplies for potable and recreational uses. Treated sewage effluents, when filtered through natural ground aquifers, can be reused in lakes for body-contact sports and other recreational activities, based on purification standards and of general public acceptance. By cautiously approaching this acceptance and using the most advanced treatment techniques this project can demonstrate that man-made processes can achieve the same acceptance and purity requirements.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Santee County Government - California

5.0159, RECLAMATION OF BIOLOGICALLY, MECHANICALLY & CHEMICALLY TREATED WASTEWATER FOR POTABLE WATER SUPPLY USES (ABBREV) **R.L. STOYER, Santee County Water District, Santee, California 92071 (14-12-444)**

Selection of the Contractor: The Santee County Water District is considered uniquely qualified to carry out the proposed work. Santee is presently the only site where ion exchange treatment of wastewater will be tested on a large enough scale to provide reliable economic feasibility data. It is therefore the only site at which a realistic comparison can be made between electrodialysis and ion exchange. To attempt the work anywhere else would necessitate the spending of large sums of money, not only for the ion exchange equipment, but for pretreating facilities that will already be available.

5.0160, RECOVERY & REUSE OF LIME AS A COAGULANT IN TERTIARY TREAT & NITROGEN REMOVAL FROM TERTIARY TREATED EFFLUENT **H.E. MOYER, South Tahoe Pub. Utility Dist., South Lake Tahoe, California**

The objectives of this project are to demonstrate a full-scale treatment plant, the advantages of the use of lime in advanced waste-water treatment, the advantages of the recovery and reuse of lime from secondary treated effluent, methods for the final disposal of waste lime sludge, and the advantages of nitrogen removal from wastewater by ammonia stripping at high pH. The plant-scale study will aim at extending the data already obtained at the South Tahoe plant from laboratory and pilot scale investigations.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
South Lake Tahoe City Government - Calif.

5.0161, INTEGRATED ACTIVATED SLUDGE-BIOLOGICAL FILTER PROCESS **D.L. SULLIVAN, San Buenaventura City Govt., Ventura, California**

The objective of this project is to demonstrate the feasibility and economics of treating domestic sewage with either an activated sludge process followed by a trickling filter or by a trickling filter process followed by activated sludge.

5. WATER QUALITY MANAGEMENT AND PROTECTION

The activated sludge and trickling filter processes are reliable individual treatment methods. The need to control pollution and increase the efficiencies of existing plants requires specific design and operational data on the combined processes to enable the use of existing or expanded facilities; for economy, this will involve or necessitate the addition of activated sludge to an existing trickling filter plant or vice versa.

5.0162, RECOVERY OF SALTS FROM SALINE WATERS VIA SOLVENT EXTRACTION R.R. GRINSTEAD, Dow Chemical Company, Walnut Creek, California 94598

A study is being made of the possibilities of applying solvent extraction methods to the problem of recovering byproducts from brines which might be produced from desalination operations. The systems under study are those consisting of high molecular weight amines and carboxylic acids which form organic salts in organic diluents. By contact with brines reversible extraction of inorganic species occurs. Because of the selectivity of the system for divalent cations over monovalent, and for large anions over small ones, the system possesses inherent possibilities in the recovery of magnesium and calcium salts, nitrate, and heavy halide salts from many brines. During the first year of work, effort was concentrated mainly on physical chemistry studies of the extraction systems. During the current year, work is being done on some possible applications, such as magnesium recovery from sea water concentrates. Some exploratory work is anticipated in areas of changing the selectivity and extractability of anions by modifying the amine structure, and of cations by modifying the acid structure. The effect of temperature on the extraction equilibria will be explored, because of its possible importance in the reverse action involved in stripping the extracted salts.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

5.0163, FORMULATION OF A GENERAL MATHEMATICAL MODEL FOR THE PREDICTION OF THERMAL ENERGY CHANGES IN IMPOUNDMENTS G.T. ORLOB, Water Resources Engineers Inc., Walnut Creek, California 94529

The development of a generalized mathematical model which will represent, within the practical and reasonable limits of accuracy, the thermal changes which may be expected under alternative hydrologic, hydraulic, and climatologic conditions for operating reservoirs. It is intended that the work support and complement that already completed or underway by the Study Team in its investigation of the Columbia River System. The project was started in fiscal year 1968 and will be completed in fiscal year 1969.

5.0180, NITRATE BEHAVIOR IN SOIL WATER UNDER FIELD CONDITIONS

J.W. BIGGAR, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Approximately 20 experimental plots, will be established on the West Side Field Station, University of California, on which unsaturated hydraulic conductivity values will be measured. In addition, the movement of surface water soluble compounds, including different sources of nitrogen, will be monitored within the soil profiles on the experimental plots. Sampling and analysis will be done to measure soil-water movement through field soils under heterogeneous conditions. Tests will be made to determine the leading characteristics of a field soil that control the distribution and loss of nitrogen from soil. Results of the research will be used to test the reliability of a computer program that is being developed by the University of Arizona in a companion research contract.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0181, PREDICTING NITRATE CONTENT OF AGRICULTURAL DRAIN WATER

G.R. DUTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Conceptual model systems involving lysimeters and greenhouse work will be utilized to determine chemical reactions and movement of nitrogen from various sources. Soils of different origin and mineral composition will be used. Data from the model systems, plus data on nitrogen uptake of various irrigated crops secured from a search of the literature, will be used to develop a computer program for predicting the nitrogen transformations taking place in soil-water systems under variations of time, moisture content of the soil, temperature, oxygen in soil air, source of nitrogen, or other factors. The computer program will be tested for reliability from data secured in a companion research contract at the University of California. The computer program will be applied in deriving estimates of the nitrogen content of drainage effluent from the San Luis Unit, Central Valley Project, California.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0182, NITRATE REMOVAL FROM THE AGRICULTURAL EFFLUENTS IN THE SAN LUIS DRAIN UTILIZING ION EXCHANGE RESINS

R.R. GRINSTEAD, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The objective is to determine the feasibility of developing an ion exchange resin process for removing nitrates from agricultural drain water. The study will include: 1. Cost estimates of nitrate removal utilizing present ion exchange technology. 2. An assessment of the possibilities for developing an ion exchange resin with a higher specificity for the nitrate ion than existing resins. 3. An estimate of the ion exchange resin properties that might be developed through a research effort. 4. Cost estimates of nitrate removal utilizing resins with higher nitrate specificity than existing resins. 5. Cost estimates and plan for research program needed to develop nitrate specific ion exchange resins.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0183, IRRIGATION RETURN FLOW

D.A. HOFFMAN, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Flows from irrigation projects have been unduly criticized for the deterioration of the water quality in receiving waters. Much of the salt content of many river basins has been attributed to irrigation projects. Studies based upon the transmission and fate of agricultural chemicals including fertilizers and pesticides will be supported and coordinated with related studies being performed under other Reclamation activities and by other organizations. In order to differentiate the salt contribution from natural irrigation, municipal and industrial sources two categories have been made under the main heading.

1. Nutrient Balance. Data will be correlated so that changes in selected water quality parameters can be determined as the water passes through an irrigation project. This extensive study will utilize existing studies now underway by the Division of Project Investigations.

2. Yakima River Project. This study will investigate the effect of irrigation upon the water quality in the Yakima River, Washington, and will be coordinated with Region 1, Boise, Idaho. This project represents an area where the water quality and quantity has been extensively modified by existing uses including irrigation. Specific objectives will be toward defining the influence of irrigation and looking toward possible remedial measures.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0184, LARGE IMPOUNDMENTS

D.A. HOFFMAN, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The Bureau of Reclamation has constructed numerous large impoundments which are characterized by being deep and long, located in an arid climate, and relatively unknown from the standpoint of limnological data. The lack of information is perhaps the greatest void in water data on these reservoirs. Three programs are now under study under this heading.

Lake Mead Limnological Studies --With the completion of Glen Canyon Dam and the filling of Lake Powell, the annual inflow pattern to Lake Mead has been substantially changed. Limnologic studies of Lake Mead were started in April 1964, and others were made in May and November 1966. Data collected from these surveys showed the detrimental effect of the filling of Lake Powell upon the water quality in Lake Mead. A Laboratory Report No. ChE-70 has been written on the research work at Lake Mead. Results from this study have lead to the initiation of a new study 'Eutrophication of Las Vegas Bay, Lake Mead.'

2. Eutrophication of Las Vegas Bay, Lake Mead.--During the surveys of Lake Mead it was found that the Las Vegas Bay was an area of poor quality water due to the low dissolved oxygen and high dissolved salts. As a result, it became obvious that an extensive study of this reach of Lake Mead should be made. Field studies will be made extensive study of this reach of Lake Mead should be made. Field studies will be made to quantitatively and qualitatively define, analyze, and recommend solutions needed to improve the water quality in Las Vegas Bay.

3. Pueblo Reservoir.--Pueblo Reservoir typifies a large terminal reservoir in an extensive water development project which delivers water for irrigation, municipal and industrial purposes. The study under this program is specifically directed to investigate the effect of a large reservoir and its limnological characteristics upon downstream water quality.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0185, QUALITY OF WATER AS AFFECTED BY STRATIFIED FLOW (RESERVOIRS)

D.L. KING, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Purpose: To investigate by means of models and prototype measurements the movement of water through reservoirs.

The growing demand for sediment-free water and water at controlled temperatures and/or dissolved oxygen content requires

5. WATER QUALITY MANAGEMENT AND PROTECTION

a knowledge of the movement of water through reservoirs. Studies will be made to determine the effects of reservoir geometry and tributary waters on temperature stratification, to develop selective withdrawal techniques, and to develop methods of reoxygenation of rivers downstream from dams. The effects of earthquakes and landslides on stratified flow, wave formation, and water movement in reservoirs may also be investigated.

A general purpose research facility is being used to study the basic principles of temperature stratification, density currents, and patterns of flow approaching outlets at different levels.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0186, GENERAL WATER QUALITY INVESTIGATIONS *P.R. TRAMUTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225*

A general, long-range approach is necessary for developing a coherent and purposeful water quality program. As one of the necessary steps in developing such a program, new studies of particular phases of the overall program will be explored and, where applicable, developed into individual programs. Proper integration with the work of other groups will be required, and an overall program will be coordinated with all of the Bureau programs and with related studies of Federal, state, and local agencies. In order to fully accomplish these objectives two programs have been set up under this program.

1. Coordination and Planning. A water Information Exchange Conference between the Denver Office and Regional personnel will be held in 1968. Also, an interagency meeting on Person Quality Research will be held at the FWPCA Southwest Laboratory, Ada, Oklahoma, in September 1967. Other meetings, conferences, and symposiums will be attended as the opportunity affords. 2. Special Studies. Research will be conducted on improving the techniques for the collection and analyses of water quality parameters such as nitrogen and phosphorous. The research program includes the improvement of standard methods and the development of new methods for detecting, measuring, and recording water quality parameters.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0187, TECHNIQUES AND INSTRUMENTATION *P.R. TRAMUTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225*

The principal purpose of this research is to develop and/or test new methods, techniques, and instrumentation to collect, analyze, and record water quality parameters for engineering and research needs. Two separate categories have been programmed for this work.

1. Field Research Laboratory.--To develop a two-man portable laboratory that can be used in adequate sized boats and/or trucks for field research work. This laboratory will function as a research laboratory and will contain recorders as well as instruments for measuring many chemical parameters, such as dissolved oxygen, temperature, and any other instruments that will adequately function under field conditions.

2. Monitoring Laboratory.--This study will be directed toward developing a field laboratory kit that can be used by regional personnel for monitoring water quality data where only a limited number of parameters are to be measured. Also, part of this program will be the selection of analytical methods for use as acceptable standards for comparing our work with others.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0188, STANDARDS AND CRITERIA *P.R. TRAMUTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225*

In order to establish water quality standards and criteria, it is necessary to know the requirements of the biota, materials, and users of the water. Specific studies will be made to better define reasonable standards for water quality factors of particular interest to Reclamation projects. Two areas of study are programmed under this heading. 1. Effect of Turbidity. will be conducted to quantitatively and qualitatively measure various types

of turbidity producing materials as to size, source, composition, etc., in relation to hydrologic conditions and their ultimate effect on aquatic life, irrigation structures, and transmission facilities. 2. Review of Standards. be devoted toward reviewing the State Standards for certain parameters required by the Water Quality Act of 1965, in order to ascertain their applicability and effect on Bureau of Reclamation projects. Research will be performed for updating standards as new methods and requirements become evident.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0189, SMALL IMPOUNDMENTS *P.R. TRAMUTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225*

In addition to the large reservoirs covered by other studies, Reclamation has many small impoundments which vary in their shape, operational mode, and climate from deep canyon reservoirs in mountain locations with a comparative high flow-through rate to shallow reservoirs located in the plains and operated with periods of long holdover.

1. Cheney Reservoir--Wichita Project.--A water quality monitoring and research program to investigate the effects of multi-level outlet conduits through shallow plains-type reservoirs was initiated in 1965 and continued through September 1967, in cooperation with the City of Wichita. The data collected by the City of Wichita will be analyzed by computer to relate the operation of the multi-level outlets with water quality.

2. Foss Reservoir--Washita Project.--A research program was initiated with Region 5 for a quality of water survey in the plains-type Foss Reservoir. The water in Foss Reservoir has been held in storage since March 1961 and the chemical quality has been decreasing due to the accumulation of dissolved salts. Also, the quality of water has been seriously affected by upstream watershed development of small retention ponds. This study has been maintained as a monitoring program for a few important water quality parameters and to establish basic requirements for a water treatment plant and/or desalinization unit.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0190, BEHAVIOR OF POLLUTANTS IN WATER *R.L. WERSHAW, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado*

The objective is to study pesticide residence time, transport mechanisms, and projected residue levels in natural soil and in natural hydrologic environments. The mechanisms of infiltration and solution of certain pesticides are being studied in the laboratory and conjunctive field studies are being planned to obtain information on the parameters related to subsurface infiltration and to the migration, retention, and decomposition in ground and surface waters.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

5.0191, EFFECT OF RECLAMATION PROJECTS UPON THE QUALITY OF WATER OF THE MISSOURI RIVER ABOVE SIOUX CITY, IOWA *R.F. WILSON, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225*

Collect and tabulate all usable quality of water records. Adjust historic estimated or recorded water quality to reflect existing conditions. Evaluate magnitude of the effect of existing and future USBR project developments upon water quality below project areas and determine the persistence of the effect upon selected downstream locations on the Missouri River.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0192, CONCENTRATION OF SUGAR BEET WASTES FOR ECONOMIC TREATMENT WITH BIOLOGICAL SYSTEMS *J.H. FISCHER, Beet Sugar Development Found., Fort Collins, Colorado 80521*

5. WATER QUALITY MANAGEMENT AND PROTECTION

The project is one phase of research to find an economic chemical or biological system to treat high volumes of sugar beet factory waste. One or more successful processes are necessary to satisfy effluent standards in States where sugar beets are processed.

The objective of the project is to concentrate sugar-beet factory wastes by chemical precipitation and reuse of the decanted solution in a closed recirculation system. The excess water accumulated during the operation will be treated by anaerobic and/or aerobic processes to remove BOD prior to discharge. The bioactivity will be studied concurrently.

5.0195, WATER AND WIND EROSION AND ITS CONTROL ON IRRIGATED AND NONIRRIGATED LANDS IN THE NORTHERN PLAINS

H.R. HAISE, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: For conditions of the Northern Plains: determine and characterize runoff and soil loss from natural and simulated rainfall under a wide range of soil cover and climatic conditions on irrigated and nonirrigated land; develop predictive equations to estimate runoff and soil loss; and determine causative factors associated with wind erosion and develop control measures including cropping practices, residue management, and other related measures adapted to the area.

Plan of Work: Cropping systems and cultural practices including tillage, residue management, and other surface treatments are developed and evaluated from the standpoint of wind and water erosion control for different soil-climatic areas in the Northern Plains. Small plot rainfall simulators are used to measure soil loss and runoff from water erosion, and portable wind tunnels and related aerodynamic equipment are used to measure wind profiles and velocities and to assess susceptibility to wind erosion and effectiveness of control measures. Benefits from deep tillage, subsoiling, vertical mulching, and so called minimum tillage practices are evaluated as related to erosion control benefits. Changes accompanying various cropping and cultural methods that occur in soil characteristics such as structure, permeability, aggregate stability and amounts, and volume weight aspects of the soil profile are measured with a view towards improvement of design of conservation farming methods. Relationships are developed from data collected at a number of locations in the Northern Plains to predict wind or water erosion losses.

SUPPORTED BY U.S. Dept. of Agriculture

5.0196, SOIL, PESTICIDES AND THE QUALITY OF WATER

D.D. JOHNSON, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: (1) To establish whether movement through the soil constitutes a significant source of the pesticides found in surface and ground water. (2) To identify the properties of pesticides and soils that control the extent of movement of pesticides in and through soil.

Procedures: Atrazine and monuron will be the pesticides used. Laboratory procedures will evaluate the influence of microbial activities on the leachability and diffusion of these pesticides in soils. Column leaching techniques decided upon by W-S2 will be used. Diffusion studies in laboratory will be coordinated with similar work of S. R. Olsen, USDA, ARS, Fort Collins. Field studies will attempt to ascertain those conditions of pesticide concentration and irrigation rate which will cause these pesticides to move through an underlying water table will be analyzed to see if pesticides have moved through the soil profile.

SUPPORTED BY U.S. Dept. of Agriculture
Colorado State Government

5.0197, A STUDY OF A WATER TOXICITY PROBLEM

E.W. KIENHOLZ, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 1. To design a bioassay of level of inorganic toxicity in potable water. 2. To survey objectionable water, to determine specific problems, and to attempt to reduce toxicity of objectionable water. 3. To define tolerable limits of specific inorganic contaminants in poultry drinking water.

Description of work proposed: Day-old chicks or poultts will be used as the assay animals. Since some of the objectionable water reportedly produces poor growth and livability of young birds, an assay will be sought which relates a bird performance characteristics directly to toxicity problems of available water. This assay procedure will then be used to compare water sources from various complaint areas, and to identify individual factors giving rise to toxic water.

SUPPORTED BY Colorado State Government

5.0198, WATER VELOCITY AND SPATIAL CO-ACTIONS OF HATCHERY TROUT AND WILD BROWN TROUT

R.E. VINCENT, Colorado State University, State Coop. Fishery Unit, Fort Collins, Colorado 80521

Resting microhabitat requirements of hatchery rainbow trout will be determined by the use of a flume where parameters such as water velocity, water temperature, water depth, and cover can be measured and controlled. After the resting microhabitat has been determined, wild brown trout will be introduced into the flume to observe behavior between the hatchery rainbow trout and wild brown trout. The order of introduction will then be reversed by introducing brown trout first, permitting them to become orientated and established residency, then introduce the hatchery rainbow. Displacement from optimum resting microhabitat should take place as the dominant individuals either by species or by prior residency will continue to occupy resting microhabitats with optimum water velocities.

The study is being conducted at the Pingree Park Campus of Colorado State University.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Colorado State University

5.0199, A SYSTEM FOR GEOLOGIC EVALUATION OF POLLUTION POTENTIAL AT MOUNTAIN DWELLING SITES

J.P. WALTZ, Colorado State University, Graduate School, Fort Collins, Colorado 80521

5. WATER QUALITY MANAGEMENT AND PROTECTION

The proposed research is to develop a hydrogeologic classification system for mountainous terrain. The classification system is to be designed for use in evaluating pollution potential at dwelling sites in the mountains.

Streams and wells in the mountains are susceptible to contamination because sewage disposal systems are usually privately owned and may be poorly situated or constructed. In addition, contaminated surface water can usually percolate directly into the ground via exposures of fractured or jointed rock. Also, direction and rate of ground water motion in a fractured medium are difficult to determine.

The procedure proposed for this research is to collect quantitative measures of topographic, geologic, and hydrologic variables. These data are to be used in a discriminant function analysis. The data will be in two groups: group I will contain information from sites where contamination has been documented and a source of pollution can be identified; group II will contain information from sites where no contamination can be detected, but where a pollution source is present.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
Colorado State University

5.0200, WATER TEMPERATURE AS A QUALITY FACTOR IN THE USE OF STREAMS AND RESERVOIRS

J.C. WARD, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Objectives: (1) Relate quantitatively the three parameters of the surface water sine curve to the meteorologic and hydrologic factors influencing water temperature. (2) To work out methods for the quantitative application of the water temperature sine curve to all types of lakes and reservoirs. (3) To obtain methods for predicting quantitatively the effects of thermal pollution on stream and lake water temperatures. (4) To study quantitatively the diurnal variation in stream and lake water temperature at all depths.

The laminar phenomena of surface injected heat will be studied in detail to determine the degree of insulation in both horizontal and vertical axes in providing habitat for motile and non-motile aquatic organisms. New Measurements of dispersal patterns of heated waters in relation to substrate types will be accumulated.

Pre-installation studies will be continued in an area of a small river system soon to be subjected to waste waters from a thermal power station.

Heat barrier effects in a lotic environment especially as related to fishes will be a part of a continuing study.

The effects of water temperatures and ice cover on the use of reservoirs and streams by waterfowl will be studied. The effectiveness of artificial ice-preventive measures will be determined on selected reservoirs.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

Colorado State Government

5.0202, CHEMICAL, PHYSICAL AND BIOLOGICAL REACTIONS OF PESTICIDES WITH SOILS AFFECTING SOIL PRODUCTIVITY AND PESTICIDE STABILITY

F.G. VIETS, U.S. Dept. of Agriculture, Fort Collins, Colorado

Object: To develop principles on the chemical, physical, and biological reactions of pesticides with soils including effects of

variations in soil environment on such reactions, pesticide stability and movement; and to investigate the effects of pesticides on soil properties, biology, and productivity.

Plan of Work: Study will be made of the effect of a pesticide on chemical and microbial processes currently under laboratory investigation. These include ion uptake and translocation in plants, ion diffusion and mass flow in soils, the chemical and microbial transformations of essential elements in soils, and the competition among microbial species in soils as affected by kind of crop and plant residues, aeration, temperature, fertilizers and amendments. The second approach will be specific studies with pesticides as to their adsorption on mineral and humus constituents of the soil, their movement in the soil by water and their stability as affected by adsorption, microbial activity and variations of temperature, water and aeration of the soil environment. A laboratory for pesticide assay will be established. Chemical techniques involved will be ultraviolet, visible, and infrared spectroscopy and fluorimetry; gas, paper and column chromatography. Radioisotopes may also be used.

SUPPORTED BY U.S. Dept. of Agriculture

5.0203, GRAND VALLEY SALINITY CONTROL DEMONSTRATION PROJECT

T.G. SPANNAGEL, Grand Vall. Water Purif. Proj., Grand Junction, Colorado

In three selected study areas, irrigation canals and other water conveyance channels will be lined to control the major source of recharge to the near surface aquifers, thereby minimizing the quantity of flow through mineral yielding geological formations and reducing the gradient which forces saline water into the Colorado River. Detailed field observations and measurements will be made to evaluate the effectiveness of lining in preventing seepage, the reduction in discharge to local surface streams, and the improvement in mineral quality.

Grand Valley Water Purification Project

5.0204, ORGANIC DEBRIS ON CONNECTICUT BEACHES AND SHORES

R. BENOIT, General Dynamics Corporation, Groton, Connecticut

General field surveys of selected sites are made. The quantity and identity of beach debris present in significant amounts is determined. Water characteristics (temperature, dissolved oxygen, salinity, turbidity) are determined. The origin of the debris is determined if possible. The microbial flora of water, sand, mud, and debris are determined in relation to the mode of decomposition of the debris.

SUPPORTED BY Connecticut State Government

5.0205, STUDY FOR FLOW REDUCTING AND TREATMENT OF WASTE WATER FROM HOUSEHOLDS

H. WALLMAN, General Dynamics Corporation, Groton, Connecticut (14-12-428)

The purpose of this program is to evaluate objectively all possible approaches for reducing the waste water flow from individual homes and/or to provide more complete treatment of the wastes that occur. The first phase of the program consists of gathering all available information on water use, waste disposal, and current research activities in water supply and waste disposal from the literature, opinion surveys, and personal contacts. The second phase will be to catalog and make a technical and economic evaluation of the gathered information to determine the most promising solutions to the water supply-waste disposal problems.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0206, DISPOSAL OF LIQUID WASTES

J.E. YOCOM, TRC Service Corporation, Hartford, Connecticut

In cooperation with an engineering firm, J. S. Minges and Associates, this study is being conducted to determine the feasibility of a centralized, shared, industrial waste treatment plant for many

5. WATER QUALITY MANAGEMENT AND PROTECTION

industries in the Bristol, Connecticut, area. However, the results may be applicable to other Connecticut cities and industries.

The special role of TRC in the project is to develop data on the technical feasibility of alternate disposal systems and to support the selection of optimum systems.

SUPPORTED BY Connecticut State Government

5.0207, REGIONAL UTILITIES STUDY-WATER SUPPLY, SEWERAGE, DRAINAGE AND REFUSE DISPOSAL

P. BOCK, Travelers Research Center Inc., Hartford, Connecticut

In co-operation with an engineering firm, J.S. Minges and Associates, this study is being conducted to develop long-range plans and short-term programs for the provision and co-ordination of water, sewerage, storm drainage and refuse disposal facilities in the Capitol Region (a 29-town area in north-central Connecticut).

The development of the study involves the following general activities for the four types of utilities: 1. Inventory of existing facilities 2. Development of an analytical study framework 3. Determination of future needs 4. Determination of adequacy of present facilities 5. Considerations of private 'on-lot' systems 6. Study of alternative plans 7. Preparation of long-range plans 8. Preparation of short-range development programs.

SUPPORTED BY Connecticut State Government

5.0208, THERMAL POLLUTION AND ITS IMPLICATIONS FOR THE COAL INDUSTRY-A SURVEY OF THE STATE OF KNOWLEDGE

P.B. CHENEY, Travelers Research Center Inc., Hartford, Connecticut

The objectives of this study are to assemble and organize information relevant to (a) the chemical, biological and physical effects of thermal pollution, (b) the heat diffusion and dissipation capabilities of different types of water bodies, (c) alternative methods for dissipating the heat prior to discharge, and (d) the implications of an increasing demand for electric power with regard to plant sizes, plant sites and cooling technology.

The scope of the study is intended to cover the field of knowledge in thermal pollution on a national scale. That is, the focus will not be on any one region of the nation, but rather to approach the problem on the basis that a study related to thermal pollution and its effects will be relevant regardless of geographical location.

SUPPORTED BY National Coal Policy Conference Inc.

5.0209, MARINE OIL-WATER SEPARATION SYSTEM SUBGROUP V

J.H. SEELINGER, Cuno Engineering Corporation, Meriden, Connecticut 06453

The Contractor intends to evaluate the feasibility of using commercially available filtration equipment (modified) to remove residual marine fuel oil from sea water. This project will include both land-based and shipboard tests of a full scale separation system.

This project was initiated in FY 66 and will be completed in FY 70.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

5.0210, PHOSPHORUS IN LAKE SEDIMENTS

R.D. HARTER, Conn. Agric. Expt. Station, New Haven, Connecticut 06504

Objectives: Discover the nature of the phosphorus exchange between lake sediment and water by (a) studying self diffusion of P32 through lake sediment, (b) establishing the effect of temperature on phosphorus equilibrium between sediment and water, (c) determining which fraction of mud phosphorus is exchanging with water, and (d) evaluating the rate of movement of phosphorus from sediment into water across a mud-water interface.

Procedure: Self diffusion of P32 through mud will be determined by constructing a core of bottom mud in small diameter

(16 mm) glass tubes. To the base of the column, or to the water above the soil, P32 will be added. The column will be sectioned and the P32 measured. Effect of temperature on soil-water equilibrium will be established by shaking a 1:25 soil-water mixture at different temperatures until equilibrium is reached. To determine which phosphorus fraction is exchanging with the water, the mud will first be fractionated. Samples of sediment will then be extracted by shaking in large quantities of water. The sediment will be fractionated to establish change in the phosphorus fractions. Rate of exchange of phosphorus from mud to overlying water will be evaluated by placing lake sediment in large cylinders and slowly renewing distilled water over the mud.

SUPPORTED BY U.S. Dept. of Agriculture

5.0211, DEVELOPMENT OF INSTRUMENTAL TECHNIQUES FOR THE ANALYSIS OF TRACE ORGANIC CONSTITUENTS IN WATER

R.P. COLLINS, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The proposed research plan involves the development of more effective methods for isolating, concentrating, identifying and measuring trace organic constituents in public water supplies. Improved and highly refined instrumentation is needed for this purpose because of the ever increasing amounts of highly complex organic constituents which are being introduced into water supplies and for which, at the present time, no techniques exist for their detection or measurement.

Laboratory investigations would test the usefulness of the following analytical procedures: a. Coupled gas-chromatography and mass spectroscopy. b. On-column trapping procedures. c. Coupled gas-chromatography and rapid scan infrared spectroscopy. d. Thin-layer chromatography. e. DEAE column chromatography for isolating and concentrating high molecular weight organic constituents.

Upon completion of the laboratory phase the analytical procedures developed would be used in sampling Connecticut rivers and reservoirs in which difficulties from industrial effluents and/or objectionable tastes and odors had been experienced.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Connecticut

5.0212, A STUDY OF MICROORGANISMS INDUCING TASTES AND ODORS IN WATER

R.P. COLLINS, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

Current research is concerned with the isolation and identification of volatile and non-volatile constituents produced by algal and actinomycetes involved in taste and odor problems in public water supplies. A combination of gas chromatography and rapid scan mass spectroscopy has been developed to aid in the identification of the odorous constituents.

5.0214, REDUCTION OF RIVER HEAT POLLUTION BY TURBULENCE STIMULATION

V.E. SCOTTRON, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

5. WATER QUALITY MANAGEMENT AND PROTECTION

One of the principal difficulties of 'run of the river' cooling of electrical generating stations is that the heated effluent tends to stratify horizontally in high temperature zones thus causing potentially serious damage to the biological cycle in the river. It is known that wind-generated turbulence and surface waves will aid mixing and will break up the stratification in relatively short distances. In calm periods the stratification tends to persist. A possible solution to this problem of high temperature concentration is the production of heavy turbulence in the normal river motion by means of artificial river bottom roughness such as cobbling or rip rap. This heavy turbulence would reduce the zones of concentration and the peak temperature levels.

The method of attack requires an investigation of the turbulence levels generated by a variety of roughness patterns. The river flows would be simulated by low-speed air flows in order to facilitate measurement of the turbulence properties. Once data are available on the effects of various roughnesses, these results can be applied to river systems. This investigation would be carried out in the Civil Engineering Hydraulic Laboratory.

5.0215, AIR OXIDATION OF ORGANIC COMPOUNDS IN AQUEOUS SYSTEMS

D.W. SUNDSTROM, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

Organic compounds can be oxidized chemically in an aqueous system by heating under pressure in the presence of air. When applied to the disposal of aqueous wastes, the technique is referred to as wet oxidation. Under the usual operating conditions, the organic wastes are not completely destroyed during oxidation. The method is of particular interest since the wastes are removed by chemical rather than by biological action.

The purpose of the project is to determine the reaction kinetics of several organic compounds during wet oxidation. The rate and extent of oxidation of several organic compounds will be examined over a range of temperatures, pressures and concentrations. Since simultaneous mass transfer and chemical reaction occur during wet oxidation, the relative magnitudes of these rate processes will be established. Initial experiments will emphasize the destruction of an insoluble organic compound in a flow reactor. The results of this study should provide a better understanding of the wet oxidation process.

5.0216, STUDIES ON PHOSPHORUS TRANSFORMATIONS IN EUTROPHIC LAKES

R.C. TILTON, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The proposed study is an evaluation of the role of microorganisms in the transformation of phosphorus compounds in eutrophic lakes.

The proliferation of algal forms and their ability to scavenge phosphate has been well defined. However, little information is available on the role of bacteria in the phosphorus cycle of eutrophic lakes.

The research will be conducted in the central Connecticut area. Mesotrophic and eutrophic lakes in the area will be analyzed for natural and unnatural phosphate compounds. Representative mixed populations and pure cultures will be tested for the ability to utilize one or more ^{32}P labelled phosphate compounds under a variety of environmental conditions such as available nutrient, pH, aeration, and oxidation reduction potential.

Results obtained from such a study will aid in the understanding of the dynamics of phosphorus utilization in an eutrophic lake and provide information on the environmental control of eutrophication.

5.0217, VARIABILITY IN DIATOM MORPHOLOGY AND WATER POLLUTION

F.R. TRAINOR, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The purpose of the present investigation is twofold: (1) to study the morphological and growth responses of freshwater diatoms to changes in the physical and chemical environment using the culture technique, and (2) to study morphological variability in laboratory cultures of diatoms incubated in natural waters. If we can demonstrate in controlled laboratory experiments as well as in cultures incubated under 'natural' conditions morphological responses of an organism to changes in environment, we would expect certain morphological types to be indicators of the chemistry of the water. Among the environmental components which will be investigated are: levels of inorganic nutrients, levels of available CO_2 , presence of certain organic substances, pH, temperature, and light.

5.0218, INDIVIDUAL WASTE DISPOSAL SYSTEMS

W.C. WHEELER, Univ. of Connecticut, School of Agriculture, Storrs, Connecticut 06268

The objective of these studies is to investigate oxygen and temperature levels in the disposal fields of individual septic systems and its effect on the over-all disposal system.

Experiments will be conducted to determine the effect of temperature and oxygen on the effluent leaving the septic tank with provisions to inject air into the drainage tile lines. The evaluation of these effects will be based upon field observations.

Both laboratory and field studies are planned. The field measurements will be made at selected locations in the state.

Instrumentation will include the use of multi-point recorders for temperature measurements, pH meter, dissolved oxygen analyzer, and the standard biological and sanitary engineering test as an aid in the evaluation of the effluents of the tests.

University of Connecticut

5.0219, WASTE DISPOSAL IN RURAL AREAS

W.C. WHEELER, Univ. of Connecticut, Agricultural Experiment Sta., Storrs, Connecticut 06268

Objectives: 1. To measure and analyze the thermodynamic, hydraulic, chemical and bacterial parameters prevalent in septic tank systems used for waste (excreta) disposal in rural Connecticut, with emphasis on temperature measurement and its interaction with the other parameters. 2. To design and test new septic systems.

Septic tank systems will be instrumented so that temperature patterns can be obtained for all phases of the treatment process. Efforts will be made to determine the quantity of influent and effluent without disturbing the operation of the systems. Bacteriological and chemical analysis will be made of influent, tank solution and effluent to determine the effectiveness of treatment processes. Laboratory and field installations will be used.

The physical properties of the disposal field will be analyzed and correlated to sewage stability and seepage rates. Effluent in the drain tile and separate tanks will be subjected to supplemental air and the effect on the aerobic digestive process will be studied.

Modified septic systems will be designed, constructed and tested for more effective disposal of agricultural waste materials from poultry flocks, dairy herds and rural residences.

5.0221, WATER QUALITY CONTROL WITH SYNTHETIC POLYMERIC FLOCCULANTS
J.K. DIXON, Univ. of Connecticut, Graduate School, Torrington, Connecticut 06790

The purpose of the proposed investigation is to study the flocculating action of synthetic polymers on colloidal solid materials in water in order to understand better their use in water quality control. Well-characterized samples of polyethyleneimine, a cationic polymer, and of polyacrylamide, a non-ionic polymer, will be synthesized with different chemical and physical properties and tested as flocculants for *E. coli* bacteria, the latter being characteristic of bacteria encountered as solids in the effluents from activated sludge digestion sewage plants. The results will be correlated with the theory and practice of earlier work in this field on the use of these polymers for flocculation of other solids encountered in water pollution control.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Connecticut

5.0222, INVESTIGATION OF AMPHIPATHIC WATER-SOLUBLE POLYMERS AS FLOCCULANTS AND FLOTATION AIDS IN DOMESTIC WASTEWATER TREATMENT
R.R. BROWN, Standard Brands Chem. Indus., Dover, Delaware 19901 (14-12-430)

New, commercially feasible, synthetic polyelectrolytes or nonionic polymers with improved flocculation ability for suspended matter in domestic wastewater will be synthesized and tested. The incorporation of surface active groups into the basic polymeric flocculant will be studied as a possible approach to enhancing the flocculating ability of polymers. Polymers will be analytically characterized as to composition, molecular weight, surface activity, charge type, density, and active group content for evaluation as flocculants and flotation aids in wastewater treatment.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0223, EFFECT OF BORON IN BIOLOGICAL WASTE TREATMENT
S.K. BANERJI, Univ. of Delaware, School of Engineering, Newark, Delaware 19711

The use of boron salts in the household detergents and in various industrial operations has increased considerably in the past few years, with the result that the wastewater from domestic and industrial sources are carrying higher amounts of boron.

The proposed research plan involves, first the determination of boron salts in the local sewage and in the neighboring streams. The second part of the investigation would determine the effect of boron salts on aerobic biological waste treatment process (e.g. activated sludge process) under various operating and loading conditions. The pH, temperature and concentration of the boron salts would be some of the variables for study. Warburg Respirometer boron toxicity results would supplement the results obtained in the aerobic biological waste treatment process. Adsorption of boron on clay & biological surfaces will also be determined. The concentration of boron on surfaces may be important in biological treatment systems.

University of Delaware

5.0224, SPRAY DISPOSAL OF LIQUID COW MANURE
N.E. COLLINS, Univ. of Delaware, Agricultural Experiment Sta., Newark, Delaware 19711

Objectives: 1. To develop the equipment needed for the daily disposal of liquid manure with a spray system. 2. To determine the safe capacity of the soil to assimilate liquid manure applied daily by a spray system.

Description: The project includes grinding and pumping liquid manure to a field disposal area. Preliminary tests will be conducted to determine the most efficient pump grinder combination and to determine the hydraulic characteristics of the liquid manure. For field disposal the liquid manure will be pumped 1000 feet to commercial sprinklers or other spreading device. Measurements of pollution, odor, insects, and microorganisms will be criteria for measuring the effectiveness of the disposal area.

University of Delaware

5.0226, BIOLOGICAL ALGICIDES
M.S. SHANE, Univ. of Delaware, Graduate School, Newark, Delaware 19711

The above named project is concerned with the isolation from nature, that is, ponds, rivers, reservoirs, lakes, etc., of viruses which will parasitize, replicate, and lyse algal cells.

Isolated viruses will be studied as to their effect upon the host cells under different environmental conditions, including pH, temperature, light, etc. A study of the morphology of new viruses will be undertaken by electron microscopy.

The work will first be done in flasks using standard methods for growing a large number of algal species and observing the effects of seeding these cultures with bacterial free inoculum from samples collected from areas which support large populations of algae.

Isolated algal virus will then be used to inoculate aquaria and ponds which have large populations of susceptible algae.

Hopefully, this research will be productive in establishing an algal virus collection which can help to furnish biological algicides for specific algal populations.

5.0227, SELF-ADJUSTING AND SELF-CLEANING FILTER FEASIBILITY STUDY
J.D. BANE, Hercules Incorporated, Wilmington, Delaware

This six-month program will determine the feasibility of a unique self-adjusting and self-cleaning filtration system for reducing water pollution from combined sewer systems during storm runoff conditions. The new concept is based on the expansion and leakage characteristics of Hercules' filament-wound, resin-bonded Spiralloy structures-used successfully in a number of missile motors and commercial applications. Basically, the Spiralloy filter will be designed and fabricated to expand at low pressures to yield numerous micron-size openings. During stormflow, the filter

5. WATER QUALITY MANAGEMENT AND PROTECTION

will expand in proportion to the hydraulic head and permit leakage of filtered water to a separate chamber for subsequent chlorination before final water-way discharge. The suspended and settleable solids will be retained by the filter and transported to a sewage treatment plant. Self-cleaning will be accomplished by the interior surface condition and a centerbody to impart high shear velocities along the filter wall. This approach offers an economical solution to the combined sewer pollution problem.

This program is being performed at Allegany Ballistics Laboratory (ABL), Box 210, Cumberland, Maryland. ABL is a government-owned laboratory managed by Hercules Incorporated, Chemical propulsion Division.

5.0228, U. S. S. R. LITERATURE ON WATER SUPPLY AND POLLUTION CONTROL

B.S. LEVINE, Individual Grants, District of Columbia

As stated above, this type of project is one described as individual. For the past seven years the undersigned had sole responsibility for the conduct and progress of this project. Thus far eight volumes of this survey have been published by the U. S. Department of Commerce, Federal Scientific and Technical Information of which Volume 6 which deals with conditions for the sanitary discharge of sewage and waste water into natural water bodies is probably the most significant. This volume is a complete thoroughly revised and reedited translation of the original work by Dr. S. N. Chrkinskii, Professor and Corresponding Member of the USSR Academy of Medical Sciences. Professor Abel Wohlman of Johns Hopkins University in his introduction to this volume stated: 'Citizens and Scientists accept the universality of the problem of determining the Conditions for the Sanitary Discharge of Sewage and Waste Water into Natural Water basins'. Dr. Levine deserves, therefore, the thanks of thousands of workers in making available in English the thoughtful exposition in the present volume'.

'The document not only should be read, but both its philosophy and the conclusions should be tested against the principles and practices prevailing in the United States.....Even a cursory review of the chapter headings reveals a rewarding prospect, while the detailed text is replete with challenging principles.'

5.0229, AN ENGINEERING INVESTIGATION OF STORM AND COMBINED SEWER PROBLEMS

J.G. CLEVELAND, Avco Economic Systems Corp., Washington, District of Columbia 20006

This project proposes to develop and demonstrate a methodology for assessing the extent of pollution from storm water runoff in an urban area, identifying the sources for effective pollution abatement and control. The method is unique in that it will provide an economical solution to the urban storm water pollution problem by an application of improved urban planning, zoning and land-use regulation, rather than extensive structural facilities.

The scope of the project includes: 1. A field assessment of storm water pollution in terms of analytical measurements from 'discrete' runoff sheds. The selection of runoff sheds will be based on land use practices. 2. The development of functional relationships between the various land-use and analytical pollution measurements. 3. Validation of methodology for pollution assessment. 4. The determination of cost and benefits of alternate considerations for the review of land-use practices desired to reduce the sources of pollution. 5. The development of the plan for implementing remedial measures necessary to abate or control dispersed pollution problems. The City of Tulsa, Oklahoma has been selected for the study. Tulsa is unique in having detailed land use records which will facilitate this study.

5.0230, IDENTIFICATION OF LIMITING FACTORS IN THE BIOLOGICAL TREATMENT OF SEWAGE

G.V. LEVIN, Biospherics Research Inc., Washington, District of Columbia 20011 (14-12-129)

The purpose of this contract is to explore the microbiological and biochemical wastewater literature to determine the intrinsic factors which limit the effectiveness of biological treatment of sewage. Comparisons of the fundamental microbial metabolic rates with those achieved in practice will be made. The information gained will be used to identify significant areas in which sewage treatment does not take full advantage of the biological processes. Once these areas are identified, laboratory and pilot plant research programs can be designed to develop improved treatment methods and practices. The information developed will be particularly useful in purifying the input to a mathematical model describing the activated sludge process which is being developed at the Cincinnati Water Research Laboratory.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0231, BIO-MASS DETERMINATION - A NEW TECHNIQUE FOR THE CONTROL OF AERATION SEWAGE TREATMENT PROCESS

G.V. LEVIN, Biospherics Research Inc., Washington, District of Columbia 20011 (14-12-419)

To examine a new method, conceived and developed by personnel of Biospherics Research, Inc. for the rapid determination of bio-mass and to assess the feasibility of applying this method in the control of sewage treatment processes. The proposed method is the firefly bioluminescent assay for microbial adenosinetriphosphate.

5.0232, SORPTION BEHAVIOR OF ORGANIC PYROPOLYMERS IN AQUEOUS SOLUTION

S.D. BRUCK, Catholic University of America, School of Engineering, Washington, District of Columbia 20017

The investigation of the sorption behavior of organic pyropolymers is proposed with special reference to the removal of organic materials (including pesticides), radioactive substances, and ions, such as NH_4 , from secondary effluents. These pyropolymers can be readily prepared from commercially available heterocyclic/aromatic polyimides and, unlike activated carbons, are characterized by the presence of a large number of nitrogen and oxygen atoms, lesser quantities of hydrogen, and depending on the starting material, ionic groups. These properties, plus the fact that the microporosity of the pyropolymers can be altered by varying the preparative conditions and thermal treatment, make these systems attractive candidates for the study of the sorption - desorption processes and for the elucidation of the physico-chemical parameters that enhance these processes. Direct comparison will be possible between the sorption - desorption properties of the pyropolymers and those of activated carbons studied by other workers.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0233, THERMAL DESTRUCTION OF TYPE E CLOSTRIDIUM BOTULINUM

C.W. BOHRER, Natl. Canners Association, Washington, District of Columbia

The determination of the heat resistance of Clostridium botulinum type E in selected food products forms the foundation of this project. This organism, long ignored as dangerous in food products, has been implicated in several recent outbreaks of botulism. In order to define clearly what the potential hazard may be, details of the growth, spore formation, toxic production, and particularly the resistance to heat and chemical and physical agents must be known. The effects of spore production medium, recovery medium for heat or chemically injured cells, and heating substrate on resulting resistance also will be surveyed. A determination of the time-temperature relationships for inactivation of the type E toxin will be determined in foods and the influence of water activity on spore outgrowth and toxin production will be included in the study.

5. WATER QUALITY MANAGEMENT AND PROTECTION

National Canners Association Research Fdn.

5.0235, INTEGRATED TREATMENT OF LIQUID WASTES FROM FOOD CANNING OPERATIONS

W.A. MERCER, Natl. Canners Association, Washington, District of Columbia

The objectives of this proposal are as follows: (1) to determine the feasibility of employing a high rate trickling filter in the San Jose, California canning plant to treat strong organic wastes encountered in vegetable and fruit processing operations, which accounted low in volume (approx. 20% of total), contribute as much as 60% to the total BOD load. The filter will be 14 ft in diameter and 21.5 ft. high, employing synthetic media and operating in a range between 100 and 200 gpm. It will be subjected to variations in flow, pH control and nutrient addition to determine its optimum working parameters. (2) To determine the effectiveness of using an air flotation process with and without addition of flocculants in removing suspended solids prior to secondary treatment. (3) To evaluate the center discharge solids separation techniques and its effect on the total BOD content.

A study will also be made of the usage of edible acids as a bacteriostatic agent to prevent growth in recirculated flume water. Following the one year testing operation, it is proposed to select units to be incorporated in full scale plant operations for a further demonstration project. The reason for the low project cost is due to NCA already having on hand several pieces of equipment required to test these processes.

STATUS: Received worthwhile information on operation of units during last fall's processing operations. Will continue with evaluation of the various units this fall.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0236, ARCTIC ECOSYSTEMS

S.G. SHETLER, Smithsonian Institution, Washington, District of Columbia 20560

Longterm studies of selected arctic ecosystems will be initiated in the summer of 1968 with the Smithsonian Expedition 1968. The Expedition will establish several sites, to be revisited in subsequent years, in the Brooks Range of Alaska, where two types of interdisciplinary ecosystem programs will be started, with different members of the team concentrating on one or the other program:

(1) Pollination Ecosystems. The total pollination interrelationships of selected plant communities will be studied, with special attention given to the role of insects in the pollination of arctic plants in general. (2) Aquatic Ecosystems. Composition, productivity, and energy cycling will be studied in selected inland lakes and streams.

It is hoped that analogous sites can be found at a later time in Europe and Asia for the purpose of making circumpolar comparisons of the ecosystems studied. The project only now is being

formulated, and it is expected that additional scientists will be joining the team, both from within and outside the Smithsonian Institution.

SUPPORTED BY Smithsonian Institution

5.0237, RESERVOIR WATER QUALITY INVESTIGATION

D. ROCKWOOD, U.S. Army, Corps of Engineers, Washington, District of Columbia

This is a five-year engineering study which has two principal parts: (1) Collection and interpretation and (2) Analyses of associated data. The ultimate aim is to develop methods for determining functional requirements and criteria for use in planning, design and operation of a reservoir for specific water quality control needs of the project basin.

Water quality surveys are now being made in 16 Corps-operated reservoirs selected to sample variability in geography, climate, reservoir geometry and release structure. The surveys include physical, chemical and biological changes, with time and space, at inflow, within the reservoir, outflow and at points below the dam. It is also planned to identify the nature and concentration level of pollutants entering or anticipated to enter the project streams.

The analysis phase of the program aims to answer the following specific questions before establishing criteria for economical design of water quality control storage and release facilities: 1. Given the release rate, its temperature and quality levels, what will be the temperature and quality of water at points downstream from the release point? 2. What level or levels of a reservoir must be tapped to meet specific water quality needs? 3. What is the water quality control need in terms of storage and release facilities? 4. What water quality monitoring equipment may be integrated with hydromet network for operating the reservoir for water quality control needs together with other authorized purposes?

5.0239, INDUSTRIAL WATER USE IN THE UNITED STATES

K.L. KOLLAR, U.S. Dept. of Commerce, Bus. & Defense Serv. Admin., Washington, District of Columbia 20230

The Business and Defense Services Administration is preparing a report relating water use by manufacturers to selected economic factors based on data obtained in three Industrial Water Use Surveys of 1954, 1959, and 1964 performed by the Bureau of the Census.

The study is concerned primarily with eight major industry groups: primary metals; chemicals and allied products; pulp and paper; petroleum and coal products; food and kindred products; stone, clay, and glass; transportation equipment; and textile mill products. The analyses of the water use in those groups, which

5. WATER QUALITY MANAGEMENT AND PROTECTION

together account for about 95 percent of all water used in manufacturing, will be presented for the Nation as a whole, for 20 industrial water use regions, and for states. Economic factors such as number of employees, productivity, value added, are to be related to gross water use, consumption, recirculation and discharge. The patterns of water use, as they differ from region to region, and from census year to census year are to be investigated.

5.0240, APPLICABILITY OF ARDOX CATALYST TO OXIDATION IN SPACE WASTE MANAGEMENT

A.A. BACHER, U.S. Dept. of Interior, Fed. Water Pol. Contr. Adm., Washington, District of Columbia

Objective: a. Problem - To provide efficient waste management processing in spacecraft applications for long-term manned space flight missions. b. Application: Long term manned spaceflight missions. c. Large weight and power savings may be achieved in future spacecraft life support systems where more efficient means of waste management process reactions can be developed.

Approach: The technical approach to be used in this research effort will be to test the maximum oxidizing capability of the ARDOX process on four process applications: (1) Water Reclamation with organic constituents, (2) Activated Sludge Process for Closed Life Support Systems, (3) Anaerobic Microbial Waste Treatment for Closed Life Support Systems, and (4) Zimmerman Process Effluent.

Progress: No significant progress to report at this time.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

5.0241, THE EVALUATION OF APPLICATION OF C-14 DATING OF GROUND WATER

B.B. HANSHAW, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The study is to investigate the feasibility of dating ground water by measuring its C-14 content. The absolute residence time of ground water is of considerable scientific interest and relates to the practical problems associated with waste disposal into deep aquifers and accidental introduction of radioactive fluids into subsurface materials.

SUPPORTED BY U.S. Dept. of Defense - Army

5.0242, TERTIARY TREATMENT RESEARCH AT THE JOINT FWPCA DISTRICT OF COLUMBIA PILOT PLANT

D.F. BISHOP, U.S. District of Columbia, Dept. of Sanitary Engin., Washington, District of Columbia

The engineering research will provide design data and cost quality relationships for a combination of tertiary processes applied to the DC secondary influent. The research contributes to the engineering development of advanced waste treatment processes and specifically to the development of pollution control techniques for water sources such as the Potomac River. It includes evaluation of nutrient removal and wastewater renovation processes using the treatment series: chemical (lime, alum, or iron salts) clarification for phosphate and particulate removal, air stripping for ammonia removal, pH controlled by decarbonation for removal of excess Ca, gravity filtration for final turbidity removal, granular carbon treatment for dissolved organic removal, and chlorination for product disinfection.

The pilot plant (100 gallons per day capacity) features automatic control systems which include measurement and control of: flow, pH conductivity, pressure and turbidity, and an automatic filter backwashing system. The filtration system also includes automatic differential pressure measurement through the length of filter media to permit evaluation of various media.

Chemical clarification is being evaluated first, with preliminary results: CaO dose - 250-350 mg/l; residual turbidity - 5-7 J.U.; residual phosphate - less than 0.5 mg/l.

The remaining processes will be added stepwise to the treatment series, following satisfactory development of the preceding processes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl District of Columbia Government

5.0243, CHEMICAL SLUDGE DISPOSAL AND CHEMICAL RECOVERY AT THE JOINT FWPCA DISTRICT OF COLUMBIA PILOT PLANT

D.F. BISHOP, U.S. District of Columbia, Dept. of Sanitary Engin., Washington, District of Columbia

The research will provide engineering design data for the handling and disposal of chemical sludge products in the joint FWPCA District of Columbia tertiary treatment pilot plant. These sludges may include calcium carbonate, aluminum hydroxide, and ferric hydroxide sludges. It will also determine the feasibility of recalcinating calcium carbonate sludges and removing lime for reuse in chemical clarification of wastewaters.

The research will contribute to the general development of techniques for 'ultimate disposal' of sludge produced by advanced waste treatment processes and specifically will attempt to improve the economics of lime clarification by recovery and reuse of the lime. The processes and the chemical sludge disposal system include sludge thickening, sludge dewatering (vacuum filtration, incineration and/or recalcination of the chemical sludge). The system features a pilot scale vacuum drum filter with continuous washing of the filter belt. Automatic weighing of the dewatered sludge takes continuous feeding of cake to a 30-inch diameter, six-hearth surface. The maximum furnace temperature is approximately 1900°F with individual temperature control for each hearth.

5.0244, FULL SCALE RAW WASTE WATER FLOCCULATION

P.V. FREESE, U.S. District of Columbia, Dept. of Sanitary Engin., Washington, District of Columbia

The objectives of this project are: To determine and to optimize improvement in solid capture in full scale primary settlers produced by the addition of polyelectrolytes to the raw wastewater. To determine and to optimize the effect of raw wastewater flocculation on the operational efficiency of full scale conventional wastewater treatment. To evaluate various polyelectrolytes.

Many conventional waste treatment plants are overloaded or operating at maximum capacity. Other plants have only primary treatment. Increased solids captured by raw waste water flocculation will improve plant expansion thus achieving a needed immediate reduction in water pollution.

5.0246, DEMONSTRATION UNDERWATER FACILITY - STORM OVERFLOW

S.A. SILVER, Underwater Storage Inc., Washington, District of Columbia

5. WATER QUALITY MANAGEMENT AND PROTECTION

The purpose of the demonstration facility is to show that by storage of combined flow storm and sanitary sewers in underwater rubber bags, the present practice of dumping overflow sewage into the rivers will be eliminated. Present overflow system at Barney Circle will be diverted to flow through a Parshall Flume for measuring flow and for sampling purposes. A part of this flow will be taken through the test plant for grit removal, shredding and removal of all large particles prior to gravity flow to the two 100,000 gallon rubberized nylon containers installed on cradles anchored in the river bed. Following a rain, or when feasible during hours from 11:00 PM to 6:00 AM the liquid from the underwater tanks will be pumped out to discharge to existing interceptor sewer system for treatment at the Blue Plains sewage treatment plant. Measurement will be taken of all flow into and out of the bags and chemical samples will be taken of effluent from sewer overflow and from tank discharge.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0247, EVALUATION OF HERBICIDES FOR CONTROL OF AQUATIC WEEDS

R.D. BLACKBURN, Univ. of Florida, Agricultural Experiment Sta., Belle Glade, Florida

Objective: To evaluate chemical compounds for their herbicidal activity against submersed, emersed, and floating aquatic weeds.

Description: New herbicides will be evaluated on 3 submersed aquatic weeds (*Elodea densa*, *Najas guadalupensis*, and *Ceratophyllum demersum*); 3 species of floating aquatic weeds (*Eichhornia crassipes*, *Salvinia rotundifolia*, and *Pistia stratiotes*); and one emersed aquatic weed (*Alternanthera philoxeroides*). Submersed Weeds: Evaluations will be done in a temperature and light intensity controlled laboratory. Application rates will vary from 1 to 10 ppmw or ppmv and contact time of herbicides with plant will be varied from 30 minutes to 4 weeks. Visual evaluations will be made at various intervals. Floating Weeds: Plants will be grown in plastic containers in a greenhouse. Application rates of herbicides will vary from 1 to 10 lb/A of active ingredient. Visual evaluations will be made at various intervals. Emersed Weeds: Floating mats of alligatorweed will be grown in plastic containers in a greenhouse. Application rates will be 5 and 20 lb/A of active ingredient applied as a foliar spray. Visual evaluations will be made at various intervals to determine the percent topkill and percent regrowth.

Herbicides that show herbicidal activity on any of these weeds will be further evaluated in growth pools constructed near the laboratory.

5.0248, DEMONSTRATION OF THE LIMITATIONS AND EFFECTS OF WASTE DISPOSAL ON AN OCEAN SHELF

R.F. MCALLISTER, Florida Atlantic University, Graduate School, Boca Raton, Florida

The purpose of this project is to learn the existing ecological regimen of an area subject to waste injection, and the effect of waste injection on an ocean shelf through a combined oceanographic and biological survey. It is further intended to learn how, by knowledge of local currents, to optimize the location of sewage outfalls. Studies will include the analysis of water and bottom samples and classification of the fauna and flora.

5.0249, EFFECTIVENESS OF IODINE FOR DISINFECTION OF PUBLIC WATER SUPPLIES & TO DETERMINE PHYSIOLOGICAL EFFECTS ON A HUMAN POPULATION (ABBREV)

A.P. BLACK, Univ. of Florida, Graduate School, Gainesville, Florida 32601

This project is to demonstrate the effectiveness of iodine for the disinfection of polluted water supplies and to evaluate the several variables affecting such procedures to demonstrate the physiological effects, if any, on a significant number of consumers

over an extended period of time. The water supplies of three state institutions will be disinfected with iodine and every sixth person of more than 600 inmates will be selected for intensive medical evaluation.

5.0250, CHEMISTRY OF NITROGEN IN NATURAL WATERS

P.L. BREZONIK, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

Factors controlling the concentration and forms of nitrogen compounds in lakes will be investigated. One phase of the project will determine the relative significance of certain components in the nitrogen budgets of lakes. The importance of rainfall, urban and agricultural runoff, nitrogen fixation and sediment laching as nitrogen sources will be assessed for the budgets of several different lakes, along with the importance of denitrification and sediment uptake as nitrogen sinks. The quantitative significance of these sources and sinks for lacustrine nitrogen budgets is virtually unknown at the present time.

The second phase of the project will study the turnover rates of various nitrogen compounds in natural waters in order to determine the factors influencing the distribution of nitrogen among its different forms. This will involve the use of ^{15}N isotope tracer methodology and in situ incubation experiments. Especially emphasized will be comparison of assimilation rates with regeneration rates; a number of environmental factors that may affect or control the rates of these reactions will also be studied. The role of organic nitrogen forms in the assimilation and regeneration processes will be investigated by ^{15}N tracer techniques.

Numerous lakes of varying trophic status and hydrologic environments are available in the Gainesville area for this project. This affords the opportunity to assess the importance of certain nitrogen sources and sinks under different environmental conditions and to compare the nitrogen cycle dynamics in a wide variety of lake types.

5.0251, NEMATODES ASSOCIATED WITH SEWAGE TREATMENT AND THEIR SIGNIFICANCE

W.T. CALAWAY, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

(1) Identify, classify, and make keys of the nematodes associated with sewage treatment; (2) Determine their biological activities in various types of treatment and their relation to stream sanitation.

Sample, process and examine samples from sewage treatment processes, unpolluted stream, especially bottom material, bottom material of streams and lakes receiving wastes, to determine which genera of nematodes or species of particular genera are the predominant inhabitant of these environments. If nematodes common to streams are found in sewage treatment, then their presence in a stream will not necessarily be indicative of pollution. The activity of these animals will be investigated either by direct microscopic examination or by observation of cultured materials. The source of these and related forms will provide further information. Study of the literature will be made to clarify this taxonomically confused group.

5.0252, THE ACTIVATION-CHROMATOGRAPHIC ELEMENTAL AND STRUCTURAL ANALYSIS OF FRESH WATER SOURCES

S.F. CRAM, Univ. of Florida, Graduate School, Gainesville, Florida 32601

The objective of the proposed research is the development of an analytical method for the simultaneous elemental analysis and organic structural determination of materials found in fresh water sources at trace concentrations. The experiments will involve the post-irradiation separation by gas-liquid chromatography of water

5. WATER QUALITY MANAGEMENT AND PROTECTION

sample constituents, and the analysis of the column effluent by flame ionization and beta- gamma-ray spectrometry.

The project will be directed toward the development of an analytical system which will be widely applicable, regardless of the elemental composition or matrix materials present, and capable of rapid and reproducible analyses. The elemental analysis of the samples will involve a gas chromatographic, post-irradiation separation, and analysis by gamma-ray scintillation spectrometry. The chromatographic separations will serve to enhance the sensitivity and simplicity of the activation analysis, and simultaneously, separate the degradation fragments of the organic compounds present. The specific detector response, specific activity, and functional group analyses of these fragments will be used to derive the structure of the original molecule.

The coupling experiment will be highly selective for, and sensitive to trace concentrations, and be very specific for all elements and organic materials present. Further, it represents a significant development in the understanding of basic nuclear-chemical interactions, and it will be developed specifically for the analysis of fresh-water systems in general.

5.0253, RESIDENCE TIMES OF WATERS BEHIND BARRIER ISLANDS

R.G. DEAN, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

The proposed research comprises the development and evaluation of a numerical model to calculate the residence times of the waters in lagoons behind barrier islands and in interconnected bay systems. The numerical model will be based on the governing differential equations of motion and continuity including all nonlinearities. Wind stresses, precipitation and tidal displacements at the openings to the water system under consideration will be included as 'input' to the numerical model. The model 'output' includes predictions of water velocity and elevation as functions of time and position in the water system. The 'output' is generated by representing the water area as a grid system and solving the governing difference equations for the prescribed spatial and temporal distributions of the input functions. To assess the validity of the model, a field program will be conducted to measure the input and output functions for at least two different water systems. The validity and limitations of the model will be based on a comparison of measured water elevations and velocities with those determined from the numerical model.

University of Florida

5.0254, TRANSVERSAL DRIFTS IN BOTTOM PROFILE

R.G. DEAN, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

Physical relationships between changes in the transversal profile due to sediment transport and the physical mechanisms causing such transport are sought under field conditions in the surf zone of the ocean. Pertinent parameters to be measured are the quantity of sand transport, waves (height and direction), water particle velocities, wind, tide, bathymetry, and sediment characteristics. All instrumentation and experimental facilities have been completed on the previous project for which this renewal proposal is being written.

The method of approach is to measure the time histories of the pertinent parameters over half a tidal cycle, i.e., four to six hours. Since we are measuring over a relatively short time interval a stationary process can be assumed and the techniques of spectral analysis will be employed to correlate the various parameters. This correlation allows direct cause and effect relationships to be obtained. In this manner, insight into the sediment transport phenomenon and basic processes occurring in the littoral zone of the ocean can be found.

5.0255, ANTI-POLLUTION AND SEWAGE DISPOSAL FOR FLORIDA COMMUNITIES

T.D. FURMAN, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

This is a continuing study, renewable annually, of various methods of sewage treatment applicable to the semi-tropical climate of Florida. Special emphasis is directed toward modifications of design standards in order to take advantage of the warm climate and increased sunshine. The use of native filter materials is being investigated. Among the studies which have been conducted is an investigation of the efficiency and degree of treatment provided by intermittent sand filtration as influenced by size and depth of sand as well as the hydraulic and organic loading. A study of lagooning to determine the degree of treatment and efficiency of this method of sewage treatment, using both settled and unsettled domestic sewage at various hydraulic and organic loading rates has also been completed. The ecology of the flora and fauna instrumental in the treatment was investigated.

5.0256, MOVEMENT AND ADSORPTION OF PESTICIDES IN STERILIZED SOIL COLUMNS

R.S. MANSELL, Univ. of Florida, School of Agriculture, Gainesville, Florida 32601

The objective is to determine the influence of soil and carrier solution properties on adsorption, dispersion coefficient and rate of movement of pesticides, detergent surfactants, hydrophobic surfactants and tritiated water in sterilized soil columns at various degrees of saturation and flux.

Soils sterilized by gamma radiation will be set up in columns (10 cm cube, sides enclosed with acrylic plastic) for miscible displacement of tritiated water and radioisotope-tagged pesticides and surfactants. Inflow and outflow will be through porous fritted-glass plates in contact with the top and bottom of soil columns. Filtered gas, under variable pressure, will be admitted through the sides of the container to establish the desired degrees of unsaturation. A Sigmamotor pump will control flux of solutions having different surface tensions.

A flow cell in connection with a three-channel analyzer for beta spectrometry will form a liquid radiochromatography system for the nondestructive detection, analysis and recording of the radioactive chemicals eluting from the soil column.

5.0257, PRIMARY PRODUCTION AND DECOMPOSITION IN ESTUARINE WATER

H.D. PUTNAM, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

The objective of the proposed research is to contribute to an understanding of the synthesis and decomposition of organic matter by primary producers in an estuarine environment. Studies will be conducted to estimate the productivity of certain red and brown algae which are part of the benthic community in the Waccasassa Estuary. Appropriate methods for measuring fixation of isotopic carbon by attached plants were worked out under grant No. WP-00678-03 which will be completed by this investigator August 31, 1967.

In addition an attempt will be made to define more clearly the limiting factors for primary production in the Waccasassa Estuary. Emphasis will be directed toward the interaction of chemical and biological factors.

Efforts also will be made to follow the decomposition of organic matter under anoxic conditions in estuarine sediments. These studies will be directed mainly toward the characterization of substrates which are involved in methanogenesis. The pool size of volatile fatty acids resulting from the breakdown of algae will be determined and efforts made to establish metabolic turnover rates of these components.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0258, EUTROPHICATION FACTORS IN NORTH CENTRAL FLORIDA LAKES

H.D. PUTNAM, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

The project objectives are: (1) to determine the validity of criteria now in use in other areas in measuring trophic levels in shallow, subtropical lakes, and if necessary develop other criteria; (2) to demonstrate the validity of the mathematical model of eutrophication developed by the application of systems analysis techniques and procedures; (3) to determine the controlling factors in the eutrophication process; (4) to establish guide lines to be used by regulatory agencies in the prevention of surface water deterioration. A small lake in an uninhibited drainage basin is to be used as a model for eutrophication and will be separated into control and experimental units by a dike. Nutrients will be fed into the experimental unit at a controlled rate. Changes in parameters will be determined and related to the change in nutrient flux to the unit. The ability of the lake to assimilate nutrients, the rates of recovery after nutrient enrichment ceases, and the possibility of controlling the factors inducing eutrophication will be studied.

5.0261, EFFECTS OF PESTICIDES ON MARINE ANIMALS

C.E. LANE, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Supported by a previous grant from the National Institutes of Health, we designed and constructed equipment to present experimental fish with water of carefully controlled salinity, temperature and pH containing precisely regulated amounts of pesticide. In this apparatus acute-toxicity studies were conducted to establish lethal levels of dieldrin for the tarpon and some other estuarine fishes. I now seek to determine the partition of pesticides between morphological compartments of experimental animals and to assess the effects of sublethal concentrations of common pesticides on various aspects of the physiology of estuarine fishes and common invertebrates of south Florida. These studies will include: 1) the concentration and activity of selected blood enzymes; 2) qualitative and quantitative analysis of various tissue enzyme systems; 3) the effects of pesticides on respiratory metabolism of entire animals and of surviving tissue

slices; 4) a description of the normal microscopic anatomy of the experimental animals and of modifications that may be induced by chronic exposure to sublethal concentrations of pesticides; and 5) the activity of ATPase enzymes in the gill epithelium will be given particular attention, since they appear to exercise principal control of gill permeability. These data should illuminate the metabolic fate and activity of pesticides in the runoff from coastal agricultural areas.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0262, WATER QUALITY AND FUNGI-NEMATODE-SEAGRASS RELATIONSHIPS

S.P. MEYERS, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Studies include those of fungal and nematode populations in Biscayne Bay (Miami) Florida, and their interrelationships with marine plant communities. Analyses of the nematode fauna involve field and laboratory studies of the large omnivorous species, *Metoncholaimus scissus*, from aspects of its aggregation and microzonality in the field. Biometric studies of *M. scissus* have revealed significant infection by a microsporidian parasite. Comparable investigations are planned with other nematode taxa to ascertain the effect of protozoan infection on nematode populations. Ecological data are being analyzed from a number of different locales in the Bay to establish a 'base line' of nematological activity to check the diversity of subtropical benthic habitats. Concurrent fungal studies involve physiological investigations to establish the dynamics of cellulolytic activity and comparative cellulase production. Laboratory investigations of the *Lulworthia floridana* group further indicate the significance of these fungi in degradation of cellulosic material in the sea.

5.0264, TRITIUM AS A TRACER FOR MIXING PROCESSES

G.H. OSTLUND, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

This is a continuing study of the distribution of fusion-bomb produced tritium in the equatorial Atlantic. Combined with salinity distribution the tritium data have yielded insight into the relative roles of horizontal and vertical mixing. Cruises in 1965 and 1967 have collected some 320 samples from the Equatorial Atlantic Current System and it is proposed to complete these analyses. The implications of these data will be investigated, relative to mixing processes, origins and time scales of components of the current system, etc.

SUPPORTED BY U.S. National Science Foundation

5.0265, STUDIES OF THERMAL POLLUTION IN BISCAYNE BAY

D.C. TABB, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Specific Aims - The overall objective of the research program is to determine the effects of thermal effluent on the macrofauna and -flora of Biscayne Bay, south Florida as successive generators (both conventional and nuclear) come into operation at the Florida Power and Light Company plant site at Turkey Point (Figures 1 and 2).

5. WATER QUALITY MANAGEMENT AND PROTECTION

1. To describe the plant and animal communities in the vicinity of the Turkey Point power plant site in qualitative and quantitative terms, and to relate qualitative and quantitative changes in these communities to changes in environmental parameters, principally temperature. This will be accomplished by utilizing standardized quantitative sampling methods already tested for statistical validity in recent studies for U. S. Public Health Service (Thomas and Fishback, 1967). These studies were carried out in Florida Bay where the habitat and faunal elements are essentially the same as those expected in southern Biscayne Bay. The sampling will provide accurate data on the kinds and numbers of macroscopic animals and plants in the study area. New information thus obtained will be related to data already gathered from a number of other studies to interpret the fluctuations which will be observed.

2. To integrate all this information plus that in the literature (Raney and Menzel, 1967) for the development of an accurate estimate of the thermal depth point for the fauna and flora, and to estimate the maximum heat load that the bay can carry while, at the same time, maintaining the ecological status quo. These estimates will be translated into specific recommendations to the proper Federal authorities as to the best disposition of the heated effluent.

5.0268, PESTICIDE MONITORING PROGRAM

P.A. BUTLER, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

Cooperative program involving 15 private, state and federal laboratories who collect duplicate samples of mollusks from approximately 175 estuarine stations on Atlantic, Gulf and Pacific coasts at monthly intervals. Program initiated 1965, proposed to continue until 1969; 1500 analyses completed September 1965. Samples are sent to the Gulf Breeze Laboratory for pesticide residue analysis. Eastern oyster is chief bioassay animal, also used *Mya arenaria*, *Mercenaria mercenaria*, *Ostrea lurida*, *Crassostrea gigas* and some fish species. Each sample is screened for Aldrin, BHC, Dieldrin, DDD, DDE, DDT, Endrin, Heptachlor, Heptachlor epoxide, Lindane and Methoxychlor. Analyses are made with electron capture gas-liquid chromatography techniques.

5.0269, RELATION OF ENVIRONMENTAL FACTORS TO THE PRODUCTIVITY OF ESTUARINE SEDENTARY FAUNA

P.A. BUTLER, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

The incidence of setting per square centimeter per seven days on asbestos-cement plates at one station in Santa Rosa Sound near Pensacola, Florida has been measured since 1949. Predominant fauna counted include barnacles, oysters and bryozoa. Concurrent data are collected on water salinity, temperature and tides. Meteorological data are available. All data are to be programmed for analysis. Continuing project.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0270, LABORATORY BIOASSAYS

J.I. LOWE, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

The primary objectives of the subject project are: (1) determination of the acute toxic levels of pesticides to representative marine species, and (2) investigation of possible adverse effects of prolonged exposure of marine animals to sublethal concentrations of the common pesticides.

Short-term (96-hour or less) toxicity tests are conducted in the laboratory under controlled conditions. Most of the tests are conducted in constant-flow seawater systems using oysters, shrimp, and marine fish as bioassay animals. These acute toxicity tests will be a continuing function of the project as new chemicals are received for evaluation.

Long-term experiments (3 to 6 months duration) involving the chronic exposure of marine animals to sublethal concentrations of selected pesticides will be conducted when the efforts and results seem justified.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0271, PESTICIDE KINETICS

C.W. MILLER, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

Investigate, under field conditions, the occurrence and distribution of insecticides in tidal areas associated with an estuary. Samples of water, soil and selected biota will be collected immediately prior to application of the test material to establish a base line indicative of previous commercial treatments. The persistence, localization and possible degradation of the test chemicals will be followed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0272, DISTRIBUTION OF LIFE WITH DEPTH

R.J. MENZIES, Florida State University, Graduate School, Tallahassee, Florida 32306

The objective of this proposal is to improve our knowledge of the distribution of animal life in the sea directly off the coast of North Carolina through a detailed photographic study on selected biological properties of the sea floor from shelf depth (180 meters plus or minus 20 meters) to the abyssal plain (6000 meters).

As a mechanism of significant improvement of the use of underwater photographs in biological studies, each photographic series will be coupled with samplings of animal life. Thus, this project involves the use of a grab camera, a multi-shot camera coordinated with large trawl samples, identification of species photographed, correlation of observed distribution with sediment type and hydrographic information. The aim will be to associate gross and reproducible features in the distribution of animal life with topography, hydrography (water characteristics, T, S, O₂) and sediment type.

5.0274, LIME TREATMENT AND INPLANT REUSE OF AN ACTIVATED SLUDGE PLANT EFFLUENT IN THE CITRUS PROCESSING INDUSTRY

J.W. HAYES, Winter Garden Cit. Prod. Coop., Winter Garden, Florida

The objective of this proposal will be to develop operational parameters and conduct an economic evaluation on lime treatment of effluent from a 2 mgd activated sludge system treating citrus wastes and in-plant reuse of the lime treatment effluent. The study will cover lime treatment, with the addition of coagulant aids, and dewatering of sludges by centrifugation for usage in cattle feed preparation. Determination will be made on this system's effective in further reducing BOD, COD, and nutrients found in the activated sludge effluent.

The proposed project intends to demonstrate the effectiveness of lime precipitation on effluent from a 2 mgd activated sludge system treating citrus wastes. The activated sludge system consists of an aeration pond providing from 24 to 36 hours detention time with the overflow being directed into a final clarifier. Operation of the activated sludge system will afford pH control along with nutrient supplementation and sludge recirculation.

5.0275, DEVELOPMENT OF SUPPORTING PRACTICES, SYSTEMS, TECHNIQUES AND DEVICES FOR RUNOFF AND EROSION CONTROL IN THE SOUTH

J.R. CARREKER, U.S. Dept. of Agriculture, Athens, Georgia

Object: (1) To develop and test improved terrace, diversion, contour and contour strip crop systems for control of runoff and erosion and to evolve better practices for the establishment and maintenance of vegetation in terrace outlets and waterways. (2) To develop techniques and equipment for studying runoff and erosion and for measuring the effectiveness of practices used in the control of runoff and erosion.

Plan of Work: Studies will be made of (1) improvement of the operating characteristics of the rainfall simulator; (2) obtaining basic data for the design of terraces, including overland and micro-channel flow characteristics, and tractive forces in soil movement; (3) improvement in the layout, cross-section, alignment and construction of terraces and waterways, including the use of parallel terraces; and (4) the effect of strip-cropping, row pattern, and other supporting practices on runoff and erosion control.

Cooperation: Georgia and South Carolina Agricultural Experiment Stations; SCS

SUPPORTED BY U.S. Dept. of Agriculture

5.0276, THE DISPOSITION OF PESTICIDES IN SOIL AND CLOSELY RELATED WATER

J.R. CARREKER, U.S. Dept. of Agriculture, Athens, Georgia

Object: To determine the mechanism and extent of movement by water of pesticide materials over and through the soil; the

relation of this movement to the quality of water originating on agricultural land; and the effect of water and soil management practices on the disposition of pesticide materials.

Plan of work: Loss of pesticide materials in washoff and drainage water will be determined from small watersheds, field areas, small plots and Lysimeters with both natural and artificially applied rainfall. Concentration of pesticides in farm ponds will be measured to determine the distribution of the material in the water, on suspended mineral and organic matter in the water, in the microflora, and on the pond bottom, all in relation to water depth, temperature, pH, chemical composition, inflow and outflow, and other properties of the pond. Pesticides in drainage water will be compared from open versus closed drainage systems. Controlled studies of leaching, adsorption of pesticide molecules on soil particles, and other physical and chemical phenomena of pesticide movement and persistence in the soil will be investigated in relation to the soil properties as well as to both time and space, soil moisture regime, soil fertility, physiological development of the plant, and time and method of application of the pesticide material.

SUPPORTED BY U.S. Dept. of Agriculture

5.0277, PHYSICAL-CHEMICAL PHENOMENA ASSOCIATED WITH ORGANO-COLLOIDAL SURFACE INTERACTIONS

G.W. BAILEY, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

Investigation is concerned with the elucidation of the nature of interactions between organic compounds and colloidal surface, particularly with regard to sorption, degradation and/or decomposition. It will be possible with such information to predict the behavior of a given organic in, through, and/or off soil surfaces and thus predict the possibility of such a compound entering water courses and causing a water pollution problem. With such information, it will be possible to predict the mechanism of pollutant transportation in water courses.

Three sorption parameters are being investigated: (1) Molecular orientation (by means of x-ray diffraction); (2) Bonding type (spectrophotometrically); (3) Thermodynamic properties (by means of calorimetry and/or appropriate thermodynamic relationships).

Adsorption isotherms will be run in addition to supplement the above parameters in formulating mechanism(s) of adsorption.

The applicability of the above findings to improving existing water and waste treatment processes will be tested.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0278, THE DETERMINATION OF THE STRUCTURES OF ORGANIC CONTAMINANTS IN WATER

A.W. GARRISON, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

It is the purpose of this project to apply modern instrumentation and scientific knowledge to the task of identification of organic pollutants in water as it relates to the establishment of water quality criteria. These pollutants arise from industrial wastes, agricultural operations, and other sources. The nature of most is unknown. The project involves extraction and concentration of the organic contaminants by carbon adsorption and liquid-liquid extraction techniques, but research into other methods of sample collection is planned. The concentrated extract is fractionated by column, gas, and thin-layer chromatography, solubility separations, steam and vacuum distillation, etc. The separated and purified individual compounds are then identified by their chemical properties, infrared and ultraviolet spectroscopy, gas chromatography, nuclear magnetic resonance spectroscopy, and mass spectroscopy.

5.0279, NMR AND IR STUDIES OF HYDROGEN BONDING IN N-ALKYLPHOSPHORAMIDATES

A.W. GARRISON, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

5. WATER QUALITY MANAGEMENT AND PROTECTION

The observation of an anomaly (doubling of the isopropyl methyl proton signal) in the high resolution NMR spectra of 2,4-dichlorophenyl methyl N-isopropylphosphoramidate had led to a detailed NMR and IR investigation of the causes of the doubling. Preliminary experiments have eliminated long range P31 coupling or inherent nonequivalence due to the asymmetry of the tetrahedral phosphorus atom as possible explanations of the doubled signals and narrowed the cause of this phenomenon to a hindrance of free rotation of the isopropyl group around the C-N bond. Further experimentation involving a variety of solvents, temperatures, and concentrations has established the cause of the hindered rotation to be intermolecular hydrogen bonding between the amido hydrogen and phosphoryl oxygen. Work is in progress to determine the nature of the hydrogen bonded species, the NMR and IR spectra of other N-alkyl-phosphoramidates being used toward this end.

5.0280, CHARACTERIZATION OF ORGANIC CONTAMINANTS IN TEXTILE WASTE EFFLUENTS

A.W. GARRISON, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

The object of this project is to identify organic contaminants which remain in textile wastes after conventional waste treatment procedures. The compounds present at this stage will be compared with the variety of compounds identified in the waste effluent before treatment so as to show which organics are not effected by the treatment process and which ones may be chemically changed by the process. This knowledge should lead to improvements in textile waste treatment procedures.

Various means of sample collection and concentration are being studied for application to this problem. These include liquid-liquid extraction, carbon adsorption, preparative gas chromatography, column chromatography, distillation, etc. The characterization of the separated organic contaminants will involve the use of mass spectrometry, nuclear magnetic resonance, infrared and ultraviolet spectroscopy, and gas chromatography.

5.0281, SOURCE DISTRIBUTION AND FATE OF C14 LABELED AND CHLORINATION HYDROCARBON INSECTICIDE RESIDUES IN FISH

A.R. GRZENDA, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

The rate of uptake of C14-labeled Dieldrin and DDT residues by Goldfish from food and water is being determined. It appears that uptake directly from water is substantially more efficient. The distribution and turnover rate of the residues are being determined. TLC radiochromatography has shown there is no degradation of the dieldrin residues. However, in the case of DDT, degradation to DDD and DDE was observed. These metabolites occurred principally in the liver. The possible role of mitochondria in the metabolism of these compounds is being investigated. Complete turnover of dieldrin residues was not noted in all tissues in approximately 3-weeks, when the fish were removed from the contaminated diet. Turnover rates for DDT have not yet been determined.

Similar work is being started with aldrin. Preliminary results indicate that this compound is metabolized to dieldrin at an extremely rapid rate.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0282, RURAL RUNOFF CONTROL

D.W. HILL, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

Summary of Proposed Work: This research is designed to evaluate the contribution of rural runoff to pesticide and primary nutrient concentrations found in natural watercourses. Many phenomena are being investigated in detail, such as: adsorption mechanisms, degrees of reversibility, thermodynamic parameters, and the nature of the ionic equilibria between the particulate phase and classes of pesticides. More general interrelationships

will be studied in the field including such phenomena as types and amounts of agricultural chemicals carried in surface runoff, in solution or adsorbed on different materials in the particulate phase; those that are mobile in interflow, and an estimate of the total amount received in the watercourse from other than surface runoff. An overall computer program will be constructed to incorporate those relationships that appear amenable to calculation. In some cases the findings outlined above will be incorporated in detail whereas other relationships may be grossly simplified in an effort to emphasize those phenomena which are relatively important in contributing to water pollution by rural runoff and to de-emphasize those which are relatively insignificant. Control recommendations and methodology will result from this research.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0283, HIGH RESOLUTION NUCLEAR MAGNETIC RESONANCE SPECTRA OF ORGANIC PESTICIDES

L.H. KEITH, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

The high resolution (100 Hz) NMR spectra of all available pesticides are being measured and cataloged with a complete and detailed interpretation. For cataloging purposes, the pesticides are divided into classes with a common chemical denominator or similar functional groups; i.e., organophosphorus compounds, carbamates, the DDT family, etc. Homonuclear double and triple resonance techniques, temperature studies, solvent and concentration effects, pH variations, hydrogen-deuterium exchange and signal integration are employed as needed to correlate the spectra with the structures of the corresponding molecules.

The extensive use of pesticides has made these compounds and their degradation products important sources of water contamination. Many of the pesticide degradation products are unknown both as to structure and toxicity. When such products are isolated and subjected to characterization studies, these spectra of the parent compounds will be a valuable reference source to aid in structure elucidation.

5.0284, CHARACTERIZATION OF ORGANIC CONTAMINANTS IN PAPER MILL WASTE EFFLUENTS

L.H. KEITH, U.S. Dept. of Interior, Southeast Water Lab., Athens, Georgia

A number of monoterpenes, sulfides and oxygenated organic compounds have been identified from the waste effluent of a kraft paper mill which does not employ waste treatment procedures. The primary emphasis of this project, however, is on the characterization of organic compounds from the treated waste effluents of paper mills; the object being to determine pollutants which either resist the conventional treatments or are formed during the treatment process. Various means of sample collection and concentration are being studied (liquid-liquid extraction, carbon adsorption, vacuum distillation, etc.). The characterization of the organic contaminants involves the use of gas chromatography, mass spectrometry, and nuclear magnetic resonance, infrared and ultraviolet spectroscopy as the primary means of structure elucidation and confirmation.

5.0287, THE DISPOSITION OF PESTICIDES IN THE SOIL
O.E. ANDERSON, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

A. To determine the distribution of pesticides in selected soils and their drainage waters, using sites to which known amounts of pesticides have been applied. B. To determine the physical, chemical, and biological processes, and soil characteristics which are important in the disposition of pesticides in soils.

The distribution of selected pesticides in soils will be determined by applying rates of pesticides to small, level, fallow, plots located on undisturbed profiles of differing soils of the Georgia Piedmont. Plots will be enclosed to retain rain which falls on a given plot and to prevent pesticide movement from plot to plot at the surface. At intervals, the profiles will be sampled to as much as five feet in depth and the pesticide content of the soil determined by standard methods. Studies will be extended to cropped soils after movement patterns have been characterized in fallowed soils.

Using soils selected for the movement studies, the pesticidal effect on mineralization and nitrification in unfertilized samples and in samples fertilized with an ammoniacal source, will be studied in the laboratory at temperatures from 2 degrees to 32 degrees C. by measuring the relative amounts of NH_4 , NO_2 , and NO_3 at various time intervals. Variables will be types, rates, and methods of application with special attention to the placement relationship in the soil sample of pesticide to nitrogen source.

5.0288, RELATIONSHIPS BETWEEN PESTICIDES AND GEORGIA FARM POND ECOSYSTEMS
R.A. BARNHART, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

This study is to provide some answers to the problems of the relationship of pesticides and farm pond ecosystems.

Most of Georgia's farm ponds are constructed on piedmont clay or coastal plains soils. These two major soil types will be employed in the experimental design which will test DDT and Endrin. Known concentrations of the pesticides will be introduced into plastic pools and the resulting concentrations in the two soil types, of flowing and nonflowing water systems, as well as concentrations contained in fishes and plants will be determined by use of gas chromatographic methods.

5.0289, BIOLOGICAL ACTIVITIES OF MARINE FUNGI
M.S. FULLER, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The fungi are common in the oceans as saprophytes, parasites of algae, and invertebrate animals. This research has as its primary objective the acquiring of more precise information on the role of fungi in marine ecology. A group of little known coccoid organisms is to be examined morphologically, physiologically, and biochemically to determine both their evolutionary relationships and potential role in the marine environment. One such organism which may cause the gaping disease of oysters is being examined in greater detail. Two parasites each of marine

algae and invertebrates are being subjected to detailed study to elucidate the (1) mechanism of host entry. (2) development of the parasites, and (3) the environmental and internal control of entry and development of the parasites.

5.0290, THE DISPOSITION OF PESTICIDES IN THE SOIL
J.E. GIDDENS, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

Objectives: A. To determine the distribution of pesticides in selected soils and their drainage waters using sites to which known amounts of pesticides have been applied. B. To determine the physical, chemical and biological processes, and soil characteristics which are important in the disposition of pesticides in soils. Initial work will be on Treflan and Atrazine.

Procedure: Movement of herbicides in runoff water and in percolating water will be studied using tagged compounds wherever possible.

Herbicidal compounds will be applied to soil differing in properties. By soil perfusion and other techniques, breakdown rate of the herbicides as influenced by soil properties and enriched microorganisms will be determined. Attempts will be made using gas chromatography, spectral absorption, and bioassay to identify degradation products.

Herbicidal effect upon rhizosphere organisms and effect of rhizosphere organisms on herbicides will be determined after foliar and soil applications of herbicides and making plate counts and respiration studies of microorganisms. Specific root infecting fungi will be inoculated into the root zone in presence and absence of herbicides and their behavior studies.

Herbicidal effects upon soil processes as nitrification, N fixation, and X-transformations will be studied.

Georgia State Government

5.0291, ENTERIC BACTERIAL DEGRADATION OF STREAM DETRITUS
C.W. HENDRICKS, Univ. of Georgia, School of Agriculture, Athens, Georgia 30602

At the present time many of our clean freshwater lakes and streams are receiving loads of fecal material. Besides being aesthetically objectionable, such conditions are also a serious public health hazard, and little is known about the ability of enteric bacteria to metabolize organic materials associated with the aquatic environment. The major objective of this project is to conduct basic research on mechanisms by which enteric bacteria, including pathogens, can survive and multiply within the aquatic environment. Particular attention will be given to the understanding of the growth-promoting activity of the various types of substrates present within the stream and to describe conditions that will influence the rate of turnover of both bacterial populations and substrates. This type of knowledge should give a firm basis for the construction of a model to describe the self-purification potential of a stream and perhaps yield useful data on how presently contaminated bodies of water may be reclaimed.

5.0293, PHOSPHORUS BUDGETS OF LAKES SIDNEY, LANIER AND HARTWELL

D.C. SCOTT, Univ. of Georgia, Graduate School, Athens, Georgia 30602

Lakes Lanier and Hartwell although in two different water sheds are somewhat similar in type of watershed and in size. Lake Lanier, however, probably receives considerably more nutrients than does Hartwell. Preliminary studies on Lanier have disclosed some interesting vertical distributions of phosphorus and iron in the period immediately preceding fall overturn (the only time that samples have been taken by this investigator). These observations have aroused an interest in the phosphorus cycle in this body of water. Parallel studies on Lake Hartwell may provide a contrasting situation which will aid in our understanding the phosphorus cycle in these impoundments and elucidate the fate of introduced nutrients in them.

5.0294, AEROBIC DISPOSAL OF ANIMAL WASTES WITH CONTINUOUS WATER REUSE

R.E. SMITH, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

Objectives: To study the operating characteristics of a system for the disposal of animal wastes with continuous aeration and mixing of the wastes and the use of effluent from the system for the requisite dilution of low moisture animal wastes from cattle, swine, and poultry.

To determine the design parameters for the system of influent waste dilution, feeding rate, detention time, 5-day BOD reduction, and rate of sludge build-up.

Description: Prohibitive quantities of water are required to dilute animal waste for decomposition in aerobic disposal systems. This study will reuse the effluent of a laboratory aerobic disposal unit as the diluent of influent animal waste. It will determine if concentrations of any component of animal wastes will be detrimental to the growth of the requisite microbes. Information will be obtained about optimum input rates, dilution times, BOD reduction, and rates of sludge build-up.

5.0295, RADIOTRACER STUDIES ON RAPID SAND FILTRATION

G.G. EICHHOLZ, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

This project continues a current research project aimed at determining the distribution and dynamics of fine particles of given sizes in rapid sand or anthracite filters of controlled composition and size distribution. The effect of surface condition, flow rate, bed composition, and chemical exchange on primary deposition and subsequent elution of suspended matter in the filter is being studied by means of radiotracers. Continuous readings on deposition curves and detailed analysis of succeeding layers of the filter as well as the collection of dissolved tracer ions are employed to observe the behavior of the test filter under representative conditions. Analysis of the filtration curves makes it possible to evaluate appropriate kinetic coefficients for the adsorption and exchange mechanisms.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Georgia Institute of Technology

5.0296, DETERMINATION, EVALUATION, AND ABATEMENT OF COLOR IN TEXTILE PLANT EFFLUENTS

R.K. FLEGE, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

Water pollution due to excess color is sometimes the result of textile mill effluents. It may be the result of discharged dyestuffs or it may be the result of an interaction of colorless dye intermediates with intermediates or finishing agents from the same or other plants or with natural organic waste in the stream. The problem has been greatly complicated in recent years by new classes of dyes and chemical auxiliaries for dyeing and finishing processes which have been introduced as a result of technologic innovations and new fibers.

The research will involve field and laboratory studies of the rate and extent of color build-up in streams carrying effluent from mills engaged in different kinds of textile processing. Laboratory investigations will include: (1) Spectrophotometric analysis of specimens from streams and mill effluents, (2) Development of spectrophotometric and chromatographic methods for characterizing the coloring matter, (3) Use of standard methods of water analysis to determine character and content of non-colored chemicals.

Field investigations will include: (1) Sampling of streams and mill effluent to obtain specimens needed to determine the time distribution and magnitude of color build-up, (2) interviewing management and technical personnel in plants which contribute seriously to the color pollution problem, (3) Correlation of laboratory and field data to provide a basis for recommendations to and action by the mills.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Georgia Institute of Technology

5.0297, DETERMINATION OF DEGRADED DYES AND AUXILIARY CHEMICALS IN EFFLUENTS FROM TEXTILE DYEING PROCESSES

R.K. FLEGE, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

Work will be directed toward the development of methods for identification and quantitative measurement of dyes and chemical auxiliaries, in raw and treated textile mill effluents.

Chromatographic and indirect spectrophotometric methods of analysis will be investigated. Methods developed will be extended to cover residues, from those dyes and chemicals, originating from reactions in the dyebaths or waste treatment processes.

Dyeing formulae will be made up from widely used dyes and auxiliary chemicals. Analytical methods will be developed for identification of those known dyes and chemicals.

Effluents from commercial dyeing processes, that make use of chemicals in the model formula, both before and after conventional waste treatment, will then be analyzed in an attempt to determine the degradation product of those dyes and chemicals resulting from waste treatment processes.

Processing formulae using known dyes and auxiliary chemicals will be subjected to laboratory waste treatment techniques, simulating those used for treatment of domestic waste in conventional treatment plants and lagoons. Effluents from these experiments will be analyzed for presence of original dyes and auxiliaries and their forecasted degradation products.

5.0298, INVESTIGATION OF THE INFLUENCE OF VALENCE STATES OF IRON AND MANGANESE UPON THE BIOTA OF THE HYPOLIMNION

J.J. HEISE, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The proposed research will investigate the role of valence changes in manganese and iron cations and the resulting effectiveness of their utilization by micro-organisms of the hypolimnion. The study will investigate both the absorption of these cations in sediments and the factors which make them soluble for use by biota. Model systems will be formulated from the data obtained to predict the dynamic changes in reservoirs brought about by changes in valence states of cations that affect the biota. Additionally, optimal conditions for high quality water sources may be determined from the data.

Field work will involve the sampling of biota, water, and sediments of selected reservoir. In the laboratory, the samples will be

5. WATER QUALITY MANAGEMENT AND PROTECTION

analyzed, quantitatively and qualitatively simultaneously, for certain valence states of manganese and iron by electron spin resonance spectrometry; a secondary colorimetric technique will be used to determine the total quantities of cations for comparison with valence states found; data will be evaluated to determine changes in the cations as they exist in solution, in micro-organisms, and in sediment.

5.0300, A STUDY OF GEORGIA RIVERS AND LAKES

R.S. INGOLS, Georgia Inst. of Technology, Engineering Experiment Station, Atlanta, Georgia 30332

The study of Georgia Rivers has been supported by a small budget over many years to permit the travel involved in observations of rivers and lakes near Atlanta for development of research work with outside support. At the moment, the support of a Water Resources Center project under public Law 88-379 has permitted an expansion of the research on water quality in the hypolimnion of lakes and the rivers below hydraulic power installations. Observations have been made while teaching or directing special student projects. Numerous basic publications have been developed and services rendered to industry and government agencies with the instruments acquired for these studies.

SUPPORTED BY Georgia Institute of Technology

5.0301, PRODUCTION AND DISPERSAL OF PATHOGENIC BACTERIAL AND VIRAL AEROSOLS BY AERATION OF CONTAMINATED WATERS

R. KING, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The mechanism of bacterial aerosol production from polluted waters has been demonstrated for selected bacteria. These investigations, however, have not been expanded to include pathogenic bacteria and viruses.

It is proposed to investigate aerosol production from polluted waters as a possible pathway for the spread of tuberculosis and viral diseases.

Effects of tuberculosis have been demonstrated at extremely low concentrations of tuberculosis bacteria in the air. The spread of tuberculosis in the vicinity of certain sewage treatment plants by aerosol formation is, therefore, a possibility. Studies utilizing organisms which demonstrate similar characteristics to *Mycobacterium tuberculosis* will be conducted. Such an organism may be *Mycobacterium smegmatis*.

The survival rate of viruses has been shown to be quite high in air. An investigation to demonstrate aerosol formation by aeration of polluted waters as a means of dispersing viruses to the atmosphere will be undertaken using as subjects those viruses which attack bacteria (bacteriophages) to simulate those which are of importance to man.

Experimental equipment will include a controlled atmosphere (wind tunnel) equipped with devices for the aeration of bacterial and viral solutions under varying conditions (simulated sewage treatment processes). Down wind aerosol samples will be collected by means of slit samplers, settling plates, and others, analyzed by means of applicable microbiological techniques, and subjected to statistical analysis.

SUPPORTED BY Georgia Institute of Technology

5.0302, THE FINITE ELEMENT METHOD IN FLUID MECHANICS

P.G. MAYER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The finite element method is a powerful analytical tool in solving engineering problems. The present study is undertaken to explore the applicability of this method to hydraulic engineering.

Successful solutions have to be found in steady saturated subsurface flows. The application is to be extended to time-dependent problems. Its immediate usefulness may be in problems involving heat dissipation and the disposal of biologically or chemically degradable liquid wastes.

SUPPORTED BY Georgia Institute of Technology

5.0303, CHARACTERIZATION OF STREAM REAERATION CAPACITY

E.C. TSIVOGLU, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

Research Objectives: The broad objective of this research is to fully develop techniques for the accurate evaluation of waste treatment needs and associated costs in specific situations as currently used procedures are not adequate. The principal source of difficulty and large error has been our inability to accurately evaluate the reaeration capacity of natural streams. Research begun by the Administration three years ago has been successful in providing a direct field technique for the accurate determination of stream reaeration capacity. This technique now forms the necessary basis for providing water pollution control agencies and industry with the means for accurate evaluation of and prediction of waste treatment requirements and costs.

The specific objectives of this research, are to apply the gaseous tracer method developed by the Administration to: evaluate the range of error normally associated with the various available mathematical models for predicting reaeration capacity (O'Connor-Dobbins, Churchill, etc.); on the basis of direct field observations of reaeration capacity, to develop the necessary modified and/or additional models for this purpose; and, to develop a standardized laboratory procedure for evaluating the effects of various kinds of water pollutant on the reaeration capacity of river water.

In order to assure results and procedures that are practical and directly applicable to specific problems, the proposed research is to be conducted with natural river waters and with specific real wastes such as municipal, paper mill, and poultry processing wastes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0304, WEED AND ALGAE CONTROL, SMALL IMPOUNDMENT INVESTIGATIONS

UNKNOWN, State Game & Fish Commission, Atlanta, Georgia

Objectives: To determine the most effective new chemicals and/or technique for control of noxious aquatic vegetation.

To test pre-emergent treatments using soil sterilents during winter drawdowns using new herbicides as available.

Procedures: Field testing and observations of new aquatic herbicides and techniques will be initiated to determine feasibility for inclusion in management programs for the Commission. Controls will be used whenever possible in order to better evaluate herbicides and techniques tested. The numbers of experiments will be determined by the quantities of new herbicides that are available and the availability of satisfactory testponds.

New coil sterilents will be applied as available to the exposed mud flats of some ponds and evaluated the following summer after inundation. A reconnaissance survey of ponds with known weed problems will be conducted to select those most suitable for experimentation.

5.0305, HYDROLOGY OF COASTAL AREA IN THE VICINITY OF RICEBORO, GEORGIA

A.N. CAMERON, U.S. Dept. of Interior, Water Resources Division, Atlanta, Georgia

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Georgia.

Purpose - To determine the hydraulic and chemical characteristics of surface waters in the North Newport River Drainage Basin and the piezometric surface and quality of water in the principal artesian aquifer in the vicinity of Riceboro prior to the beginning of operations of a large industry as well as after the plant is in operation.

Methods - The tidal behavior of the Newport River estuary will be studied and the amount of interchange between salt and fresh water, the time of travel through the estuary, and the dispersion patterns will be determined. Discharge measurements will be made. Chemical analyses will be made on water samples collected periodically and water quality monitors will be installed. Wind direction and velocity component data will be recorded at one station. Continuous water level recorders will be installed on four wells. Electric and gamma-radiation logs will be made of selected wells within 30 miles of Riceboro to determine the amount of casing and depth of the well and aid in interpretation of the geology and identification of the aquifer. Aquifer tests will be made at the plant site after completion of the plant wells.

5.0306, SALT-WATER ENCROACHMENT IN THE BRUNSWICK AREA, GEORGIA

D.O. GREGG, U.S. Dept. of Interior, Water Resources Division, Atlanta, Georgia

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Georgia.

Purpose - To determine the feasibility of reducing the rate or stopping chloride contamination of the aquifer by pumping water from the underlying brackish-water zone.

Methods - Two wells will be constructed in the brackish-water zone near the focus of one area of contamination of the overlying fresh-water aquifers. One well will be pumped to reduce the artesian head in the brackish-water zone and the other used as an observation well. Water from these and existing wells will be sampled and head measurements will be obtained to observe the effects of pumping.

5.0310, CHARACTERIZATION AND REMOVAL OF REFRACTORY COLOR COLLOIDS FROM HAWAIIAN SURFACE WATERS

N.C. BURBANK, Univ. of Hawaii, Water Resources Research Ctr., Honolulu, Hawaii 96822

Refractory color colloids in naturally occurring Hawaiian surface waters have long caused waters of otherwise potable quality to be regarded with aversion and as unacceptable by citizens even in the midst of drought.

Previous testing using the conventional coagulants have failed to give satisfactory removals of color.

The project is designed to determine the basic physical chemical electric properties of the refractory colloids, to determine their charge (zeta potential) and the character of the charge (cationic or anionic). It is also designed to determine the correlation of zeta potential with the dosage of coagulant or coagulant aid, the reduction of the zeta potential to discharge the color colloid, the selection of a high molecular weight coagulant aid to act as a weighing agent, and the further addition of a simple chemical or a synthetic polyelectrolyte to discharge the color colloid, to discharge the zeta potential to zero to assist in the collision and coagulation of the color colloids by the natural forces of attraction. In this the progression of the coagulation and colloid discharge must be observed with an instrument of the quality and capabilities of the zeta-meter.

R.H. YOUNG, Univ. of Hawaii, Water Resources Research Ctr.,
Honolulu, Hawaii 96822

The proposed project will study the physical and chemical characteristics of return irrigation water derived from areas of tropical agriculture. Sampling will be from areas on Oahu, with principal sites at Kalauao and Kahuku, and Maui and Kauai. Well samples will be obtained from these areas for complete water analyses including determinations of pH, conductivity, chloride, sulfate, nitrate, hardness, bromide, iodide, boron, total organic carbon, and phenols. Basic data collection will necessitate sampling of rainwater, surface runoff, bulk-fallout and spring water. Tritium studies for flow tracing and age-dating of samples will be utilized. The total water quality information obtained will be collated and correlated with irrigation practices and land-use patterns to ascertain man's contributions to basal water, to assist in formulation of ground water quality standards, to identify patterns of ground water flow, rock weathering and chemical erosion.

5.0315, MARINE TOXINS OF THE TROPICAL PACIFIC

A.H. BANNER, Univ. of Hawaii, Hawaii Inst. of Marine Biology,
Kaneohe, Hawaii 96744

In the investigation all marine toxins arising from the tropical biota of the reef and shore fauna of the Central Pacific that may be passed on to man, directly or indirectly, will be studied. The studies are divided into three major phases: the biological origin,

the chemical isolation and identification, and the pharmacological action of the toxins. Correlated with the major aspects of the investigation is the accumulation of local island knowledge of toxic marine animals, native remedies, and the epidemiology of fish poisoning in the Pacific.

For the present year of investigation, as in the previous years, the main emphasis will be upon those fish which are regionally toxic and cause the loosely defined disease known as ciguatera; biological field studies will be conducted in French Polynesia; chemical studies will attempt to further elucidate the structure of the toxic molecule, now isolated; and pharmacological studies will be concerned both with the development of assay methods adaptable for field conditions and with investigations of the mode and site of action of the drug.

5.0316, PREVENTING OR CONTROLLING ACCELERATED EROSION OF UNSTABLE FOREST SOILS

W.F. MEGAHAN, U.S. Dept. of Agriculture, Intermtn. For. & Rge. Ex. Sta.,
Boise, Idaho 83706

Object: To identify the interrelations of soil, water, and vegetation to soil stability; to determine mechanical and vegetation cover requirements for stabilizing soil; and to study soil movement and water yield as affected by timber harvesting and roadbuilding methods.

Plan of Work: The project staff is continuing to survey natural land slumps on slopes and in channels. Studies are proceeding to evaluate the effect of hydrologic and erosion processes related to roadbuilding, logging, and natural land slumping. They are developing soil-stabilizing methods of roadbuilding, slash disposal, cover establishment, and channel structures. Pilot watersheds are being calibrated to evaluate the above processes and stabilizing procedures plus the comparison of logging methods that might be employed on steep unstable slopes.

SUPPORTED BY U.S. Dept. of Agriculture

5.0317, EUTROPHICATION RESEARCH AMERICAN FALLS RESERVOIR STUDY

V.C. BUSHNELL, U.S. Dept. of Interior, Bureau of Reclamation,
Boise, Idaho

Eutrophication of the American Falls Reservoir has become an acute problem. This study includes sampling the reservoir at seven locations at different depths, and eleven significant inflowing streams at two-week intervals from May 1 - October 1, 1968 and 1969. Tests include: Temperature and DO on site; one quart samples with HgCl₂ added to 40 ppm are analyzed for COD, SiO₂, Phosphates, ammonia, nitrite, nitrate, and organic N; and one quart samples (iced) for pH, ED, B, CO₃, HCO₃, Cl, SO₄, Ca, Mg, Na, K, and F. Notes are taken on visual algae conditions. One gallon samples are collected, as appropriate, for suspended solids.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

5.0318, DETERMINATION OF THE DISTRIBUTION OF RADIONUCLIDES DISCHARGED TO THE GROUND AT THE NRTS, IDAHO

J. BARRACLOUGH, U.S. Dept. of Interior, Geological Survey,
Idaho Falls, Idaho

Program is a continuation of that conducted in previous years. The observation of migration of the radioactive isotopes contained in the aqueous wastes has been a primary part of the program. Underground movement has not yet reached a steady state and observations will continue until steady state is reached. The program consists of observation of radionuclide migration and is determined from empirical analysis of data on aquifer discharge effects observed as water level fluctuations in wells tracer studies using both natural and introduced elements for the purpose of determining both vertical and horizontal movement, determination of head differentials between aquifers and single wells and between wells and bore hole geophysical logging.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Atomic Energy Commission

5.0319, HYDROLOGY OF SUBSURFACE WASTE DISPOSAL - NATIONAL REACTOR TESTING STATION, IDAHO

J.T. BARRACLOUGH, U.S. Dept. of Interior, Water Resources Division, Idaho Falls, Idaho

Objectives of this project are to acquire information on the geohydrologic and geochemical environment of the National Reactor Testing Station, requiring a study of the composition and structure of the earth materials underlying the plain, the inventory and continued evaluation of the water resources, the dynamics of the hydrologic cycle, and relevant geochemical processes. This information will help to determine within the environment the concentration of any increment of aqueous waste disposed and to define it qualitatively in time and place.

Attempts will be made to determine the direction and rates of vertical and lateral ground water movement within the basalt aquifer system, movement and dispersion of radioactive wastes, the volume of regional ground water movement and storage, and to apply the techniques of radioactive dating of the quaternary basalt and Tertiary rocks exposed in the area to the solution of structural problem significant in the geohydrology of the Station.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

5.0320, REDUCTION OF GROUND WATER INFILTRATION INTO SEWERS BY ZONE PUMPING

D.M. STOREY, Meridian City Government, Meridian, Idaho

The project consists of a 20 inch well, up to 100' deep and lined with a perforated casing. A pump of up to 700 gpm capacity is to be used with a probable total dynamic head of 35' to pump ground water out of the well into a drain ditch for transfer to a local stream. This will lower the water table and keep ground water infiltration out of the sanitary sewer system, thereby reducing flooding conditions to basements in the City of Meridian.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Meridian City Government - Idaho

5.0321, STREAMFLOW REGULATION AND SEDIMENT CONTROL IN NORTHERN ROCKY MOUNTAIN FORESTS

H.F. HAUPT, U.S. Dept. of Agriculture, Moscow, Idaho

Object: To relate forest characteristics and timber harvesting methods to snow accumulation and melt, streamflow peaks, sedimentation, and improved water yields; and to reduce streamflow peaks and sediment production and increase summer flow.

Plan of Work: The project staff is calibrating experimental watersheds to evaluate streamflow characteristics and sediment transport. Plot studies are progressing on roads and skid trails to determine, (1) erosional processes, (2) the hydrologic processes of infiltration, percolation, overland flow, and storage in relation to soils, and (3) watershed damage prevention methods. The staff is also conducting plot studies in timber-harvest areas to determine, (1) the effect of western white pine and lodgepole pine on snow behavior, (2) the effect of different cutting practices on precipitation disposition, (3) erosional processes, and (4) watershed damage prevention methods.

SUPPORTED BY U.S. Dept. of Agriculture

5.0322, AZOTOBACTER ECOLOGY

G.R. ANDERSON, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

Objectives: (1) To determine whether or how Azotobacter propagate in the main streams and irrigation systems of Southern Idaho. (2) The identification and classification of Azotobacter from plot and soil studies. (3) To determine if Azotobacter can serve as an indicator of the toxicity of fluorine effluents.

There continues to be some promise in the possibility of using free-living microorganisms, particularly Azotobacter, as nitrogen suppliers for crops. The ecology of these organisms in Portneuf soils and related-irrigation waters will be studied. The

effect of nutrients and climatological factors on Azotobacter in native waters will be followed through population changes. Unusual Azotobacter isolates from natural and artificially induced populations will be identified through known keys. The particular effect of fluorides on Azotobacter strains will be measured in soil, water, and laboratory cultures, using a fumigation chamber.

Idaho State Government

5.0323, AQUATIC ENVIRONMENT AND FOOD HABITS OF MAYFLIES

M.A. BRUSVEN, Univ. of Idaho, Water Resources Research Inst., Moscow, Idaho 83843

The food habits of mayflies will be studied in northern Idaho, principally in the St. Maries and St. Joe River drainages. Both polluted and unpolluted waters will be investigated representing streams, ponds, and reservoirs. Gut analyses will be performed on the digestive tracts of immature mayflies to determine their food habits and preferences and to evaluate the role of food as a limiting factor in regulating the distribution and abundance of this aquatic group. In addition, the physical and chemical characteristics of the water will be studied, the substrate will be critically evaluated to understand microhabitat requirements and an attempt will be made to study the interrelationships of mayflies with other components of the biota in the aquatic ecosystem.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Idaho

5.0324, BEHAVIOR AND HABITAT INTERACTION OF BROOK TROUT AND CUTTHROAT TROUT

J.S. GRIFFITH, Univ. of Idaho, Cooperative Fishery Unit, Moscow, Idaho 83843

Objectives: 1) To study interaction in habitat selection between cutthroat and brook trout. 2) To study the comparative behavior of the two species, both intra- and interspecifically, and its role in habitat selection and maintenance.

Methods: 1) Sections have been chosen in each of three northern Idaho streams - one stream has only cutthroat present, one with brook trout only, the third with both species. 2) Map and physical parameters of each section. 3) Periodically during summer 1968 mark locations of fish in each section by skin diving. 4) Analyze habitat data by multiple regression technique to assess interaction. 5) Remove all members of one species in sections with sympatric populations to collect microhabitat data, and observe if remaining fish move to vacated areas. 6) Observe behavior in laboratory stream tank and in field.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
University of Idaho

5.0325, SOILS, PESTICIDES AND THE QUALITY OF WATER

G.C. LEWIS, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

Emphasis of the project will be placed on the following objectives: (1) to establish whether movement through the soil constitutes a significant source of the pesticides found in surface and ground water. (2) To identify the properties of pesticides and of soils that control the extent of movement of pesticides in and through soils. (3) To ascertain the effects of management of pesticides and land on the transport, by all means, of pesticides to water supplies.

Organic phosphate compounds will be the class of pesticides studied. Leaching columns in the laboratory and field plots will be used to study the following variables in relation to pesticide movement: (1) soils of different texture, cation exchange status, and organic matter content. (2) Different moisture regimes-continuous leaching and adding solution in increments after equilibrium has been established. (3) Different ratios of calcium, magnesium, and sodium in the leaching solution.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0326, BIOLOGICAL PRODUCTIVITY OF THE COEUR D'ALENE RIVER AS RELATED TO WATER QUALITY
F.W. RABE, Univ. of Idaho, Water Resources Research Inst., Moscow, Idaho 83843

The objectives of this study are (1) to collect and analyze certain physical and chemical data from the South Fork and North Fork of the Coeur d'Alene River, Idaho; (2) to measure primary production in various zones of the river and to estimate standing crop of herbivore and carnivore levels over a yearly period; and (3) to determine the median tolerance limits (tlm) of rainbow trout, *Salmo gairdneri*, to various concentrations and combinations of heavy metals from the river. Field collections will consist of collecting data from various locations in the river which typify clean water and water treated with mine wastes and domestic sewage. Periphyton will be collected to assess production. Laboratory studies will involve bioassays of fish under both static and running water conditions.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

5.0327, THE FEASIBILITY OF REUSE OF CHLORINATED SEWAGE EFFLUENT FOR FERTILIZATION AND IRRIGATION IN IDAHO (ABBREV)
R.E. WILLIAMS, Univ. of Idaho, Graduate School, Moscow, Idaho 83843

The objective of this study is the evaluation of the feasibility of statewide reuse of sewage effluent. The steps to be taken consist of: 1. Location of communities in Idaho producing sufficient volumes of effluent to merit construction. 2. Determination of average annual volume of effluent of reuse facilities produced by each community -- minimum usable volume will have to be determined during the course of the study. 3. Determination of type of treatment employed by each community. 4. Determination of type and thickness of soils and geologic formations in each community. 5. Determination of distance from each community to irrigated crop land or to a forested area which might receive effluent. 6. Determination of types of crop grown in each irrigated area. 7. Determination of type of irrigation system employed in each area. 8. Estimation of cost of introducing sewage effluent from each locality into the existing irrigation system. 9. Estimation of cost of chlorination of effluent. 10. An analysis of existing devices in each locality which may be used for the monitoring of the quality of waters moving downward toward the ground-water table. 11. Determination of distance from ground surface to ground-water table in each locality. 12. When possible an interpretation of the direction of movement of ground water at each locality. 13. Determination of annual volume of phosphate and nitrate currently applied to the irrigated land in each locality investigated -- the volume of effluent required to duplicate this application rate can subsequently be estimated.

Once these data have been collected and analyzed, it will be possible to define those areas in Idaho wherein the addition of sewage effluent to streams can be eliminated and safely and beneficially applied as fertilizer and irrigation waters to crop or forest lands.

5.0330, REAGENTS FOR DETERMINATIONS OF TRACE IMPURITIES IN WATER
A.L. CASKEY, Southern Illinois University, Graduate School, Carbondale, Illinois 62903

The proposed research plan involves laboratory investigations in the design of reagents for determinations of trace impurities in water. The first family of reagents involved will be sulfonated ortho nitrosonaphthols.

Problems proposed to receive early attention are: A. The Spectrophotometric determination of Nitrate in Water Using 2-Nitroso-1-naphthol-4-sulfonic Acid. B. The Spectrophotometric Determination of Nitrite in Water Using 1-Naphthol-4-sulfonic Acid. C. Effect of the Position of the Sulfonic Acid Substituent on Acidity of the Naphtholic Hydrogen. D. Sodium 2-Nitroso-1-Naphthol-5-Sulfonate as a Reagent for Cobalt in Water. E. 2-Nitroso-1-Naphthol-7-Sulfonic Acid. F. Sodium 2-Nitroso-1-Naphthol-8-Sulfonic Acid.

The long term objective of this proposed research is to develop ideal reagents; sensitive, specific, stable, water soluble reagents for rapid, spectrophotometric determinations of trace impurities in water.

5.0333, BIOLOGICAL SURVEY OF STREAMS OF COLES COUNTY, ILLINOIS
L. DURHAM, Eastern Illinois University, Graduate School, Charleston, Illinois 61920

This project's purposes are: 1. To determine the present species of fishes, macroinvertebrates and plankton in the streams of

5. WATER QUALITY MANAGEMENT AND PROTECTION

Coles County, Illinois. 2. To determine the present environmental conditions in the streams with respect to pollutants (organic materials, silt loads, chemicals and others). 3. To compare the existing fish populations and environmental conditions with those present approximately 53 years ago as reported by Hankinson (1913).

This information will be useful in many forms of fresh water biology, including fisheries management and pollution control. Also, a planned flood control reservoir which is to be built near Charleston, Illinois will undoubtedly have considerable effect on many of these streams. This study will provide a good record of conditions prior to the influence of the reservoir.

5.0337, AMMONIA STRIPPING MATHEMATICAL MODEL FOR WASTE WATER TREATMENT R.H. SNOW, IIT Research Institute, Chicago, Illinois (14-12-193)

To develop a mathematical model of air stripping of ammonia from waste water. Variables to be considered are: pH, post-precipitation, operating temperature ranges, distribution of capital and operating costs. The model will be written in a FORTRAN language applicable to an IBM 360/65 computer.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0338, USE OF COAGULATION IN THE FLOTATION OF WASTEWATER C.F. GURNHAM, Illinois Institute of Technol., School of Engineering, Chicago, Illinois 60616

'Gross flotation' is the removal from a water medium of all species of particulate matter, including oily droplets, by attachment to the particles of freshly nucleated gas bubbles, followed by gravity separation and skimming. This process is currently in use for the treatment of industrial and municipal wastewaters, and serves to remove suspended matter including much that is not removable by the more conventional operations of pri-

mary treatment. Along with the suspended matter removal, the biochemical oxygen demand and other parameters of stream pollution are simultaneously reduced.

The process of gross flotation would be more widely used, to the benefit of the nation's waterways, if some of the present operating difficulties were better understood and could be removed, and if the operating efficiency of the process could be improved. The use of chemical coagulation in conjunction with gross flotation is an obvious means for improvement. Some waste treatment facilities have successfully employed this technique; other attempts have failed completely. Recycle ratio is undoubtedly a significant variable; zero recycle gives the maximum yield of bubbles and the opportunity for nucleation on the dispersed particles, but damages or destroys the coagulant floc by the necessity of passing it through a pump and other constrictions. Increasing recycle ratios can eliminate the latter problem, and may still produce an adequate bubble yield. Nucleation, however, is an essential and little understood aspect. The hypotheses of time lag in nucleation and of a possible very significant distinction between nucleation in homogeneous and heterogeneous fluid media are to be investigated in the project.

5.0339, ISOLATION AND TAXONOMY OF YEASTS IN LAKES AND SEWAGE L.R. HEDRICK, Illinois Institute of Technol., Graduate School, Chicago, Illinois 60616

To date, 13 different sites in the Calumet River area on the Illinois-Indiana border have been sampled for yeasts. The two genera most often encountered were *Candida* and *Rhodotorula*. In an effort to determine just what aspects of pollution were affecting the yeast population, data on chemical and physical pollution indicators were fed along with the numbers of yeasts into an IBM 360 computer. At every station, it was found that two parameters which gave the highest regression values were the nitrite-nitrate nitrogen and dissolved oxygen content of the water.

Currently, a survey of changes in yeast populations with the seasons is being conducted. The following pathogenic yeasts have been isolated: *Cryptococcus neoformans*, *Torulopsis glabrata*, *Candida tropicalis*, *Candida Parapsilosis*, and *Trichosporon cutaneum*.

5.0340, EFFECTS OF SURFACTANTS ON FIBROUS BED COALESCENCE R.C. KINTNER, Illinois Institute of Technol., School of Engineering, Chicago, Illinois 60616

The efficacy of close-packed beds of a mixture of fibers of cotton and a supporting material has been demonstrated and the results published (Sareen, et. al., A.I.Ch.E. Journal, 12, 1045 - 1966). The effects of Surface Active agents were shown to be unpredictable by ordinary criteria. In the current work, it is proposed to characterize the various types of SA agents as to solubility, hydrolysis, polarity, ionic condition, etc., in such a way that their effect on coalescence of oil droplets in an aqueous liquid field can be predicted. The use of an emulsion 'break-time' test seems to be the best criterion to date. Surface phenomena are of paramount importance and the manner in which SA agents produce such interfacial conditions is a prime subject of this inquiry. The relation between these factors and coalescence is a final objective.

5.0342, ULTIMATE DISPOSAL OF PHOSPHATE FROM WASTEWATER BY RECOVERY AS FERTILIZER

K.M. RIES, W.R. Grace & Company, Lake Geneva, Illinois 60047 (14-12-171)

A method will be developed for removing nutrients, i.e., phosphates and ammonia nitrogen, from wastewaters and converting them into a fertilizer material. The phosphates, which are concentrated in the aerobic step of the activated sludge process, will react with the ammonia present in the waste stream and added magnesia to form magnesium-ammonium-phosphate. This compound is of low solubility in water and can be separated by the use of flotation or other separation techniques. The separated magnesium-ammonium-phosphate sludge will be converted by further processing into a fertilizer material.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0343, DEVELOPMENT OF A MATHEMATICAL MODEL FOR SEPARATION COAGULATION AND SEDIMENTATION PROCESS USING ADDITION OF CHEMICALS

W.A. JASIONOWSKI, General American Trans Corp., Niles, Illinois (14-12-416)

The contractor shall develop a mathematical model for coagulation and sedimentation of activated sludge process effluent using lime or alum as an additive. The emphasis shall be placed, first, on establishing the current state of design procedures for predicting the performance of existing equipment such as the Inflico Densator or Accelerator. Next, limitations of current design procedure should be delineated by comparison with data from existing installations.

The limitations of existing design procedures should then be used as a basis for developing improved design procedures or, if necessary, recommending additional experimental programs.

The model shall consist of a set of preliminary design relationships for computing the size of the equipment required, the amount of chemicals and power required, and estimates of both capital and operating and maintenance cost. The performance of the process as expressed by the volume flow and concentration of all important species in the effluent streams from the process as a function of the characteristics of the influent stream and the operating and design conditions should be expressed in mathematical terms.

5.0345, SYSTEMS APPROACH TO COMBINED SEWER-STORMWATER OVERFLOW POLLUTION ABATEMENT

J. FINK, Shelbyville Government, Shelbyville, Illinois 62565

This project is a full-scale demonstration of the application of several control and treatment methods applied in a coordinated manner to abate pollution of surface waters caused by overflows of untreated wastes from combined storm and sanitary sewers.

The effectiveness of treating combined sewer overflows from small drainage areas utilizing three types of detention and treatment units will be evaluated. The individual units will be incorporated into a total control system for the community.

Units to be installed and evaluated include: 1. lagoon designed for 5-day detention of a 10-year storm, followed by primary and secondary stabilization lagoons--receiving flow from 95% of the drainage area. 2. A storm overflow holding tank for 600% of dry-weather flow. 3. weather flow with 2-hour detention. The tank will be equipped with a chlorinator, comminuter, solids collecting facilities and lift station to pump sludge to the municipal sewage treatment plant.

5.0346, COOK STREET STORM WATER OXIDATION POND

P. TROEMPER, Springfield San. Dist. No. 5, Springfield, Illinois

Springfield, like many older cities, has an extensive system of combined sewers. Separation of these sewers is economically impractical at the present time. Conventional treatment of the combined sewer overflow is not considered feasible since it would be difficult to keep available a supply of organisms sufficient to treat the storm volumes. The oxidation pond seems to provide the most likely possibilities for a solution. Tributary to this project contains approximately 12.5 square miles of separate sewered area and 3.25 square miles of combined sewered area. It is proposed to investigate feasibility of the oxidation pond to treat combined sewer overflows by measuring flow from the pond, and 24 hour composite sampling of both pond influent and effluent for BOD, suspended solids, and coliform counts. Daily grab samples will be taken at 3 points in the receiving stream for D.O., BOD, suspended solids and coliform count. Biological sampling of the pond and stream will be done at monthly intervals. A fish assay of the stream will be run before the start and at the completion of the investigation.

5.0348, EFFECTS OF POSSIBLE POLLUTANTS ON ENERGY PRODUCTION BY BLUEGILL LIVER MITOCHONDRIA

R.C. HILTIBRAN, State Natural History Survey, Urbana, Illinois

In 30 Warburg experiments, data indicate that of the four metals, cadmium, zinc, manganese and calcium, cadmium, zinc and manganese altered oxygen uptake more than phosphate uptake whereas calcium altered phosphate metabolism more than oxygen uptake. Less extensive data on other metals indicated that divalent and monovalent copper, trivalent and divalent iron, cobalt and aluminum severely inhibited oxygen uptake over a wide concentration range but did not alter phosphate metabolism at any level. Chromium and barium inhibited oxygen uptake only at high levels, but did not alter phosphate uptake.

5. WATER QUALITY MANAGEMENT AND PROTECTION

The ultimate objective of these investigations is to attempt to correlate the effect of these metals on oxygen and phosphate uptake with the recorded toxicity data of these metals to bluegills.

SUPPORTED BY Illinois State Government

5.0349, CHEMICAL CONTROL OF AQUATIC VEGETATION

R.C. HILTIBRAN, State Natural History Survey, Urbana, Illinois

Seven new herbicide preparations were used for the first time during 1967. A total of 36 herbicide preparations were applied to 13 aquatic plant species in 119 test areas in 14 bodies of water. Preemergent herbicides were tested in 69 test areas. Most of the preemergent applications were made in late December 1966 and the remainder in April of 1967. The recent development of leafy pondweed, *Potamogeton foliosus*, in Allerton Lake has given us an opportunity to test the effect of preemergent herbicides against that species. The results indicated that rates of 20 lbs/acre of dichlobenil and fenac did not give season-long control of leafy pondweed and new approaches will be tried in attempts to obtain season-long control. Recently it was brought to my attention that spatterdock, *Nuphar advena*, and waterstargrass, *Heteranthera dubia*, were not controlled in Illinois by herbicides suggested for their control. It was found that granular silvex and 2,4,5-T at a rate of 80 lbs/acre substantially reduced stands of spatterdock within the treated area. Liquid applications of silvex and 2,4,5-T were not effective. Waterstargrass was eliminated from the treated areas by diquat cation at a rate of 1 ppm. The effect of other herbicides on waterstargrass was not determined.

Most of the herbicides tested for the first time were not as effective on the species treated as are the currently available herbicides.

5.0350, INORGANIC ADDITIONS RESULTING FROM WATER USE

R.L. EVANS, State Water Survey, Urbana, Illinois

Normal waste treatment systems are designed to remove only the suspended and biodegradable organics. Therefore, the general character and concentration of the mineral constituents in 'one use water' are being studied as a means of assessing the reuse potential of such waters for agricultural and industrial practices or other uses.

In the initial phase of the study, five residential areas were selected, and analyses were performed on samples collected at weekly intervals from water taps and from sewers in each area. The second phase of the study will involve the collection of composited samples in the same areas to obtain an estimate of the additions of refractory organics to a water subjected to a domestic use of one cycle. Projection of the study will involve determining that proportion of common ions contributed by industrial usage of water in municipalities.

SUPPORTED BY Illinois State Government

5.0351, ILLINOIS RIVER STUDY

R.L. EVANS, State Water Survey, Urbana, Illinois

The principal purpose of the study is to determine the waste assimilative capacity of a 77-mile sector of the Illinois River from Pekin to LaGrange, Illinois. Since in this particular investigation the capacity is considered contingent upon the oxygen resources of the stream, field work is limited to critical periods of high temperature with low flow. An evaluation of existing data would appear to preclude the use of conventional analytical techniques for making an intelligent appraisal of the stream's capacity. Proper analysis will permit reasonable decisions regarding the degree of waste treatment required.

SUPPORTED BY Illinois State Government

5.0352, BIOLOGICAL ASPECTS OF TERTIARY PONDS

R.L. EVANS, State Water Survey, Urbana, Illinois

Tertiary ponds of relatively short detention periods (2-5 days) have successfully demonstrated their value in improving the effluent from secondary units of sewage treatment works. Field

observations of a 23-acre pond complex, with depths varying from 10-16 feet receiving treated sewage at an average flow of 25 mgd revealed the major biological organisms, other than bacteria, to be protozoa. An investigation has been undertaken to monitor the phytoplankton population in the ponds and associated environmental conditions for an 18-month period.

SUPPORTED BY Illinois State Government

5.0353, DIATOM REMOVAL BY FLOCCULATION

R.L. EVANS, State Water Survey, Urbana, Illinois

Plankton examinations suggest the principal forms of algae in Peoria Lake (on Illinois River) are diatoms. Recent studies indicate that some of the abundant genera are those associated with sand filter clogging. An existing water treatment plant pumping mgd from Peoria Lake provides a means for determining the removal efficiency of plankton in a clarifier preceded by a flocculation unit. Data to be evaluated will include flow, detention, chemical dosages, temperature, chemical characteristics of raw water, floc formation, and plankton reduction.

SUPPORTED BY Illinois State Government

5.0354, LIMNOLOGICAL STUDY OF PEORIA LAKE

R.L. EVANS, State Water Survey, Urbana, Illinois

A short-term study of Peoria Lake (on Illinois River), commencing in March 1967, was undertaken to gain some insight on the dynamics of phosphorus, nitrogen, iron, turbidity, and silica as related to phytoplankton productivity in natural waters. Two hundred and twenty-five water samples have been collected and subjected to chemical and biological examination. Evaluation has been substantially completed and a report is being prepared.

SUPPORTED BY Illinois State Government

5.0355, NUTRIENT REMOVAL IN A WATER TREATMENT PLANT

R.L. EVANS, State Water Survey, Urbana, Illinois

The Illinois River with a total phosphorus concentration ranging from 0.5 - 3.0 mg/l (as P) serves as a source of water for the city of Peoria. Treatment units consisting principally of a flocculator, clarifiers, and sand filters produce potable water. The uses of chemical coagulants, filtration, and biological stripping have been demonstrated as possible avenues for phosphorus removal. This study involves the collection and analyses of water samples for the purpose of determining the extent of phosphorous and ammonia-N removal as well as changes in COD, BOD, total residue, and others and the role each treatment unit contributes to such removal or changes in concentration.

5.0356, HYDRAULICS OF STORM SEWER JUNCTIONS

H.W. HUMPHREYS, State Water Survey, Urbana, Illinois

The growth of new urban areas has made urban storm drainage a major problem in the country today. There is an urgent need to improve designs for the several parts of a storm drainage system. As one facet of the needed research, a model test program is planned to study the hydraulics of storm sewer junctions. At the present time, storm sewer junctions are designed by 'rules of thumb,' developed through the years in engineering practice. The model tests should indicate the validity of these 'rules.' If better design criteria can be developed, the design procedures then can be modified, which could result in more economical structures.

5.0359, REDUCTION OF HAZARDS ASSOCIATED WITH INSECTICIDAL CHEMICALS IN THE ENVIRONMENT

W.N. BRUCE, Univ. of Illinois, Agricultural Experiment Sta., *Urbana, Illinois*

Objectives: 1. Determine the fundamental physical, biochemical, and biological factors influencing occurrence, magnitude, interaction, and persistence of insecticidal chemical residues in soils and raw agricultural commodities. 2. Identify and evaluate fundamental factors influencing the magnitude and mechanism of air and water pollution by insecticidal chemical residues. 3. Develop basic studies related to the metabolism and detoxication of insecticidal chemical residues in animals, plants, soils and water. 4. Identify and evaluate the effects of residues of insecticidal chemicals on eco-systems with special emphasis on fish and wildlife. 5. Explore the reciprocal influences of residues of insecticidal chemicals on soil microflora, microfauna, and non-insect fauna. 6. Develop and improve analytical techniques essential to the pursuit of this research.

Procedures: To study the persistence, metabolism and detoxication of insecticide chemical residues in soils, plants, animals and water and study the effects of toxicant residue on ecosystems in soils and water.

5.0360, LIVESTOCK WASTE MANAGEMENT AND SANITATION

D.L. DAY, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

Field testing the oxidation ditch method of treating manure collected beneath slotted floors in hog finishing buildings is in progress. A second partially slotted floor building has been equipped with a rotor. Data including D.O., B.O.D., C.O.D., pH., temp., solids, and fertilizer value are being collected and analyzed by a digital computer program. Foaming has continued to be somewhat of a nuisance, but the material in the gutter has been maintained in an odorless condition. Complete biological stabilization has not been achieved without subsequent treatment.

An investigation of aerating cattle manure was performed by D. D. Jones for his M.S. degree thesis research. The objective was to determine the aerobic-digestion characteristics of beef and dairy cattle on high-concentrate rations. Significant reductions of biodegradable organic-matter were obtained without odor problems.

5.0361, MECHANISMS OF SLUDGE THICKENING

R.I. DICK, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

It is proposed to continue previous work which has shown present criteria for evaluating the solids loading capabilities of

settling tanks to be inadequate when applied to activated sludge because of their failure to consider the rheological properties of the material. Attempts will be made to define the fundamental mechanisms which control the behavior of the sludge. The techniques for examining the thickening properties of activated sludge will be extended to other suspensions which are troublesome in water and wastewater treatment because of their failure to consolidate into compact masses. Results of laboratory batch settling tests will be compared to the performance of continuous processes in the laboratory and the field. Knowledge of the basic properties of the suspensions will be employed to evaluate possible chemical, physical or biological processes or alterations of conventional processes which might improve the effectiveness of sludge thickening. Rational bases of design of the thickening portion of settling basins, as suggested by results of the fundamental studies, will be proposed.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0362, SECONDARY EFFLUENT POLISHING BY RAPID SAND FILTRATION

R.I. DICK, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

The suitability of rapid sand filtration as a means of advanced treatment of effluent from secondary biological waste treatment plants is being investigated. Two pilot models of rapid sand filters have been installed and operated at an activated sludge waste treatment plant. Final effluent from the plant has been used. Changes in suspended solids, biochemical oxygen demand, chemical oxygen demand, dissolved oxygen, and nitrogen compounds have been noted.

SUPPORTED BY University of Illinois

5.0363, APPLICATION OF SEWAGE SLUDGE TO FIELD CROPS

R.I. DICK, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

Investigations are being carried out to evaluate the effect of digested sludge constituents on crops, land, and on ground and surface water. A few of the potential sources of concern are heavy metals, nitrates, and pathogenic microorganisms. Other information needed to permit a rational approach to the design of new systems involving liquid application of sludge to land is being sought. Examples of such information are the optimum dosage intensities and frequency for various climates, crops, and soil types and the effect of various sludge application methods such as flooding and spraying.

SUPPORTED BY Chicago City Government - Illinois

5.0364, VIRUS REMOVAL BY CHEMICAL FLOCCULATION

R.S. ENGELBRECHT, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

The purpose of the proposed research is to delineate the basic mechanisms involved in the removal of viruses by alum flocculation. The first stage in the removal of viruses by coagulation and flocculation appears to be the formation of a virus-aluminum complex, followed by subsequent precipitation and flocculation of the complex. The first phase of the study will investigate the interaction of the virus with the metal ion by (a) demonstrating the complex formation between aluminum and viruses and (b) determining the nature of the 'complex' and virus inactivation by aluminum. The second phase will be directed towards a quantitative investigation of virus removal by alum flocculation under controlled laboratory conditions, studying such variables as pH, organic matter, bivalent metal ions like calcium and magnesium, and synthetic polyelectrolytes. Throughout the study, a bacterial virus will be used as a model. The results with the bacterial virus will be confirmed using an animal virus so as to be able to interpret the data in terms of viruses which may be significant in water supplies.

5.0367, CHLORINATION OF WASTE WATER EFFLUENTS

R.S. ENGELBRECHT, Univ. of Illinois, School of Engineering, Urbana, Illinois

The objective of this study is to investigate the effect of a chlorinated waste effluent on the bacteria population of a small, receiving stream. The effluent from the activated sludge treatment plant at Paxton, Illinois, discharges into a small stream which is being sampled above and below the outfall. Effluent and the stream samples are being analyzed for total coliform, fecal coliform, and enterococcus bacteria in the absence of and during chlorination of the waste effluent.

SUPPORTED BY University of Illinois

5.0368, FACTORS INFLUENCING FREE-LIVING NEMATODES IN WATER SUPPLIES

R.S. ENGELBRECHT, Univ. of Illinois, School of Engineering, Urbana, Illinois

It has been observed that nematodes can be removed effectively by rapid sand filtration if their motility can be reduced. The use of various chemical agents, e.g., chlorine, bromine, copper sulfate and silver nitrate, on nematode motility is being evaluated in terms of nematode removal by subsequent water treatment processes. Results indicate that 3mg/l of free available residual chlorine, prior to coagulation, sedimentation and filtration, can eliminate more than 99 percent of the nematodes in the finished water as compared to about 66 percent in systems without chlorine. Copper sulfate was effective only when the hardness of water was low. Studies are being continued, using tap water, sewage treatment effluent, and stream water to determine the efficiency of different chemicals under various conditions, e.g., pH, organic and inorganic composition of the water.

5.0369, EFFECTS OF OXYGEN DEMAND ON SURFACE REAERATION RATES

E.R. HOLLEY, Univ. of Illinois, School of Engineering, Urbana, Illinois

For turbulent water flow with no oxygen demanding materials in the vicinity of the air-water interface, the surface reaeration rate has been shown to be proportional to the rate of turbulent energy dissipation. When oxygen demand is present, dissolved oxygen may be 'consumed' near the water surface and allow a more rapid reaeration. In this research, it is proposed to experimentally investigate the extent of the increase in reaeration rate due to the presence of different amounts and different types of oxygen demand. The experiments will be conducted both in a vessel with no throughflow where turbulence is generated by oscillating screens and in open channel flows with various roughness. The laboratory results will be compared with available field data.

5.0370, TRANSPORT PROCESSES OF PARTICLES IN DILUTE SUSPENSIONS IN TURBULENT WATER FLOW

B.G. JONES, Univ. of Illinois, School of Engineering, Urbana, Illinois

An experimental and analytical study of the behavior of small particles in dilute suspension in turbulent water flow in a circular tube is being conducted. Individual particle trajectories are examined by recording analog signals of the motion on magnetic tape, converting these into digital form and processing them with high-speed digital computers. The detailed characteristics of the turbulent fluid field are determined by using hot-film anemometer techniques. The macroscopic and microscopic characteristics of the particle motion are determined directly from the trajectory information. The former are compared with analytical predictions of dispersion and sedimentation. The latter provide insight into the detailed structure of the particle motion which is necessary to determine the validity of analytical models.

5.0372, (U) DETERMINATION OF FREE BROMINE IN WATER (US 14)

T.E. LARSON, Univ. of Illinois, State Water Survey Division, Urbana, Illinois (DA-49-193-MD-2909)

CHEMISTRY OF BROMINE, TO DEVELOP A SUITABLE ANALYTICAL METHOD FOR FREE BROMINE AND BROMAMINES IN WATER, AND TO EXAMINE THE REACTION OF CHLORINE WITH AMMONIA IN THE PRESENCE OF BROMIDE ION.

TECHNIQUES USEFUL FOR CHLORINE AND IODINE SPECIES IN WATER WILL BE EXPLORED AND MODIFIED WHERE NECESSARY. COLORIMETRIC AND AMPEROMETRIC METHODS WILL BE EMPHASIZED.

5. WATER QUALITY MANAGEMENT AND PROTECTION

COLORIMETRIC REAGENTS WERE EVALUATED ON THE BASIS OF THEIR REACTIONS WITH BROMINE, CHLORINE, CHLORAMINES AND BROMAMINES. AT THE PRESENT TIME METHYL ORANGE AND PHENOL RED ARE THE BEST AVAILABLE REAGENTS FOR TOTAL BROMINE AND ARE IN GOOD AGREEMENT. BROM CRESOL PURPLE IS THE BEST AVAILABLE REAGENT FOR FREE BROMINE. PHENOSAFRANIN GIVES REASONABLY GOOD RESULTS FOR FREE BROMINE, BUT ITS PRIMARY APPLICATION MAY BE IN DETERMINING HIGH CONCENTRATION OF BROMINE /UP TO 10 MILLIGRAMS PER LITER/. BREAKPOINT CURVES WITH BROMINE AND AMMONIA HAVE BEEN DETERMINED FOR VARIED CONTACT TIMES AND AT DIFFERENT PH VALUES. THE BROMAMINES ARE FAR LESS STABLE THAN THE CHLORAMINES. STUDIES OF THE STABILITY UNDER VARYING AMMONIA-TO BROMINE RATIOS AND VARYING PH VALUES HAVE BEEN MADE. A STUDY WAS MADE OF THE REACTION OF CHLORAMINES WITH BROMINE ION. NO EVIDENCE OF BROMAMINE FORMATION WAS FOUND BY ULTRA-VIOLET ABSORPTION, BUT STABILITY OF THE CHLORAMINE SOLUTION WAS DECREASED, AND IT APPEARS THAT UNSTABLE BROMAMINE WAS FORMED SLOWLY. THE CHLORAMINEBROMIDE ION SOLUTIONS EXHIBITED CHARACTERISTICS SIMILAR TO THOSE OF BROMINE SOLUTIONS. AS WITH BROMAMINE SOLUTIONS, THE STABILITY OF CHLORAMINEBROMIDE SOLUTIONS MAY BE IMPROVED BY INCREASING THE AMMONIA BROMINE /OR BROMIDE ION/ RATIO OR BY INCREASING PH.

5.0377, CONTROL OF BIOLOGICAL GROWTHS IN RAPID SAND FILTERS AS RELATED TO IRON REMOVAL

J.T. OCONNOR, Univ. of Illinois, School of Engineering, Urbana, Illinois

Problems with the reduction of iron from the ferric to the ferrous form in sand filters have been associated with the consumption of dissolved oxygen due to nitrification. In addition to the leakage of iron through the filter, nitrified filter effluents are found to have lowered oxidation-reduction potentials, lowered pH, and high total bacterial counts. It is proposed that studies be conducted to test practical remedial measures for the inhibition of biological growths in rapid sand filters being used for the removal of iron. Inhibition of nitrifying organisms would prevent nitrification in filters treating ground waters which contain ammonia. Remedial measures to be evaluated for the control of biological growths will include periodic chemical disinfection of the filter media at the time of the filter backwash. In addition, the effect of more efficient backwash procedures, employing physical methods such as surface or air wash, will be observed.

SUPPORTED BY University of Illinois

5.0378, DIFFUSION AND FLOW IN INTERPHASE TRANSPORT

J.A. QUINN, Univ. of Illinois, Graduate School, Urbana, Illinois

In elucidating interphase transport, whether encountered in conventional engineering operations or in the many and varied problems involved, in the supply and efficient usage of our water resources, the coupled problems of diffusion, convection, and interfacial phenomena invariably appear. This research program is concerned with the analysis and systematic exploration of these various problems as they apply to transfer through fluid interfaces, through structured liquids, and through model membranes. Current and proposed studies are in the following areas: (1) Convective instability in thin fluid layers, (2) Permeation through multimolecular films or model membranes, (3) Diffusion in structured fluids, (4) Transient diffusion through the liquid-liquid interface, (5) Rates of spreading and migration in a fluid interface, (6) The effect of surface-active agents on absorption rates.

Our objective in this work is to provide fundamental information on the overall subject of interphase transport, to carry out original experiments which will augment existing theories and which will increase our knowledge of the physical and chemical factors involved.

5.0379, EFFECT OF CHLORINATION ON CILIATE PROTOZOA AND THEIR ROLE AS A BARRIER TO STREAM POLLUTION

E.B. SMALL, Univ. of Illinois, Graduate School, Urbana, Illinois

This investigation will study two significant relationships of the ciliate protozoa present in a heavily, biologically polluted portion of the Saline Ditch in Champaign County, Illinois. One relationship is the role played by the ciliates as a natural barrier to the biological pollutants of the Champaign-Urbana sewage effluent. To be investigated here will be (1) the nature of the ciliate flocculating process and (2) the chemical and physical factors (e.g. Dissolved Oxygen and temperature) which may control the density of the protozoan population. The second relationship is the effect, either direct or indirect, that chlorine in various representative dilutions may have upon the protozoan populations. In the laboratory, field samples of controlled temperature circulating growth chambers where the ciliate population as well as temperature, dissolved oxygen and other factors will be monitored by electronic sensors and time lapse microcinematography. These results will be compared to the chlorine effects noted when this chemical sterilant is added to the effluent.

5.0380, DISINFECTION OF SEWAGE EFFLUENTS

F.W. SOLLO, Univ. of Illinois, State Water Survey Division, Urbana, Illinois

A study is being made of the effectiveness of bromine as a disinfectant for treated sewage effluents under varied conditions of temperature, pH, and bromine concentration in parallel with a study with chlorine as the disinfectant. Disinfection is being measured in terms of coliform, fecal coliform, and total bacterial numbers.

In addition, two streams receiving treated effluents, one chlorinated and the other to be chlorinated in the near future, are being surveyed to determine the effect of chlorination on both bacterial counts and general stream chemistry.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0381, WATER QUALITY CRITERIA FOR SELECTED RECREATION USES

E.H. STOREY, Univ. of Illinois, Graduate School, Urbana, Illinois

The proposed research plan involves laboratory and field investigations directed at the determination of water quality criteria for selected recreation uses. The objectives of the project are: I. To survey the types and extents of water pollution which are, or are considered to be, detrimental to selected water-oriented recreation activities of the residents of a six county area in East Central Illinois. A. To determine the beliefs and attitudes toward different types and extents of pollution for different activities (questions about what types and extents of pollution bother the respondents). B. To determine if choice of location for particular activities is related to physical measures of water quality. C. To determine types of pollution that users believe to affect their choices of sites for particular activities, and how the users conceptualize these pollutants. These problems are to be investigated for both on-site and off-site users. II. water quality criteria for water oriented recreation, based on a combination of information from the survey and from existing quality standards; and to develop a rating scale, for selected recreation uses of water, based on the quality criteria.

The research will be conducted by survey questionnaires and interviews of users at recreation sites and at off-site locations. Statistical analysis may include Kendal's coefficient of concordance, differences in the mean or the number of cases, bivariate frequency tables, chi square analysis, and multiple regression techniques. Both chemical and biological tests of water quality will be made.

The survey method and methods for developing the water quality criteria and rating scale, if successful, will provide states, regions, other agencies and the national with a tool to survey their

residents, test their waters and develop comprehensive water quality criteria for recreation.

5.0382, USE OF PURE STRAINS OF ALGAE AND MIXED ALGAE-PROTOZOA, AND ALGAE-BACTERIA CULTURES IN SEWAGE TREATMENT

S.V. GANAPATI, Univ. of Baroda, Baroda, India

Object: To reduce costs involved in treatment and disposal of sewage from small rural communities through determination and application of optimum algal-protozoal and algal-bacterial symbiotic balances.

Plan of Work: Various species of photosynthetic algae growing in sewage from different locations will be gathered, and evaluated as to their oxygen-liberating capacity and ability to withstand attack by zoo-plankton predators. The most suitable for cultivation in sewage liquors will be selected and the optimum conditions determined for their growth, development, and sewage purification ability. Some algae species will be further treated with ultraviolet, colchicine solution, etc. in varying concentrations, to get mutants and the resulting changes in physical and physiological properties studied and evaluated with respect to liberation of oxygen in a sewage liquor environment and consequent capacity for purification of sewage. Selected species of algae will be grown along with Vorticella, Epistylis, and perhaps other types of protozoa in a sewage liquor environment, with environment varied to determine the optimum for algal-protozoal growth and for purification of the sewage. Similar studies will be made of algal bacterial symbiosis. If laboratory results indicate promise, a pilot plant with a number of small, outdoor tanks will be constructed and its performance studied.

5.0383, EFFECT OF HEATED WATER DISCHARGE FROM IPALCO'S PETERSBURG PLANT ON THE WATERS OF WHITE RIVER, INDIANA

A.F. AGNEW, Indiana University, Water Resources Research Ctr., Bloomington, Indiana 47405

The project area is in southwestern Indiana, just below the junction of the East Fork and West Fork of the White River, Pike County, Indiana.

A thorough investigation of the physical, biological, and chemical characteristics of the river will be made over a three-year period, including one year before construction of the new steam-electric generating plant, and one year after, in order to determine the effects of thermal pollution.

It is anticipated that this investigation will result in information that will be useful not only to the power-producing company but also to the power-regulating State agency.

The investigation of several parameters, such as temperature, dissolved oxygen, fishes, BOD, plankton, turbidity, and bottom fauna has produced significant data in the past three years. The continuation of the project for another three years will permit us to continue to assess the effect of Unit No. 1, and the added effect of Unit No. beginning in 1969.

This project will also include a microbiologic study by Thomas D. Brock and Warren Silver as part of an AEC contract.

5.0385, MICROBIOLOGICAL ASPECTS OF ACID MINE-DRAINAGE

R.M. RAMALEY, Indiana University, Graduate School, Bloomington, Indiana 47405

The high concentrations of sulfuric acid and ferric ion found in streams draining coal mining regions are due almost entirely to the biological oxidation of the pyritic minerals associated with coal, chiefly by autotrophic bacteria in the Thiobacillus-Ferrobacillus group.

The present investigation will emphasize the quantitation of both the iron-oxidizing and sulfur-oxidizing bacteria in several Indiana localities, according to the method of Silverman and Lundgren (J. Bacteriol. 77:642, 1959); in addition, chemical data will be obtained from each of the sites visited. (All dilutions, etc. will be conducted in the field to minimize errors that may occur during transport back to the laboratory.)

Some attention will also be given to the development of a rapid field test for the biological rate of sulfur or iron oxidation (present tests require 15 days).

It is hoped that this study will indicate methods of strip mine operation that show the most promise in preventing the microbiological oxidation of sulfur and iron, and will supplement recent investigations on the chemical aspects of acid mine-drainage in other areas (Barnes and Romberger, J. Water Pollution Control Fed., 40:371 (1968)).

5.0386, HYDROLOGY STUDY IN U. S. GYPSUM MINE, SHOALS, INDIANA

Y.M. STERNBERG, Indiana University, Graduate School, Bloomington, Indiana 47405

An artesian water system appears to be actively dissolving gypsum and associated rocks in the lower part of the St. Louis Limestone near Shoals, Indiana and probably elsewhere along a line running about N 20 degrees W from near Alton on the Ohio River to Freedom in Owen County. The source of the water is not known but is presumed to be up the dip of the rocks to the east of areas of known gypsum. It may be that the ultimate source of the water in the Shoals region is the extensive sinkhole area near Mitchell. The system discharges through a line of sulphate-water springs that includes those at French Lick and West Baden plus several others less widely known. Most of these springs flow into the East Fork of White River or into the lower part of Lost River.

In the first phase of the study the source direction of movement and the quantity of water involved will be determined using trace studies and water level elevations of wells and nearby streams.

5.0387, TERTIARY TREATMENT OF COMBINED STORM WATER, SANITARY RELIEF DISCHARGE AND SEWAGE TREATMENT PLANT EFFLUENT

F. GURNHAM, East Chicago Sanitary District, East Chicago, Indiana

The objective of this project is to develop and verify, on a small pilot scale, the preliminary design and operating conditions for chemical coagulation, sedimentation, dual media filtration,

and granular activated carbon adsorption for treatment of combined municipal industrial wastes mixed with storm run-off. This pilot-plant unit will be operated for approximately 4 months. In addition, the aim is to design and construct a minimum 1-MGD pilot plant to include the operation of the above process steps.

5.0388, THE EFFECT OF INORGANIC SEDIMENT ON STREAM BIOTA

J.R. GAMMON, Depauw University, Graduate School, Greencastle, Indiana 46135

The basic purpose of this research is to quantify the effect of inorganic pollution in the form of stonedust on certain biotic components of the stream. Thus far a deleterious effect on macro invertebrate populations of riffles and fish populations of pools has been noted in pools and riffles immediately downstream from the point of pollution. No major reorganization of species composition has occurred, although some species of fish appear to be scarce below the point of sediment entry. The populations of these biotic components approach normal farther downstream.

5.0389, A STUDY OF THE QUALITY OF INDIANA SURFACE WATERS

J.M. BELL, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

Data collected during an 8 year period from 24 Indiana streams, Lake Michigan, and the Ohio River was analyzed.

A quality index was calculated for 63 sampling stations. The quality characteristics used in the calculation were: dissolved oxygen, B.O.D., Temperature, coliforms, specific conductance, pH, and chlorides. The project is a continuing study.

5.0393, REDUCTION OF INSECTICIDAL HAZARDS

J. FAHEY, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

1. Determine the fundamental physical, biochemical, and biological factors influencing occurrence, magnitude, interaction, and persistence of insecticidal chemical residues in soils and raw agricultural commodities. 2. Identify and evaluate fundamental factors influencing the magnitude and mechanism of air and water pollution by insecticidal chemical residues. 3. Develop basic studies related to the metabolism and detoxication of insecticidal chemical residues in animals, plants, soils and water. 5. Explore the reciprocal influences of residues of insecticidal chemicals on soil microflora, microfauna, and non insect fauna. 7. Develop and improve analytical techniques essential to the pursuit of this research.

DESCRIPTION OF WORK PROPOSED: Study the effect of cultural practices such as methods of application and tillage on the deposition, distribution and persistence of residues of insecticidal chemicals in soils. Investigate chain of contamination such as the translocation of insecticidal chemical residues from soils into mint hay and their occurrence in mint oil. Study the dislocation of insecticidal residues from soils through water movement and the accumulation of insecticidal chemicals in ponds and drainage water. Investigate the effect of chemical and physical composition of soil on the persistence and resistance to leaching of insecticidal residues. Study the effects of insecticidal chemicals on the non-insect fauna of the soil. Improve instrumentation and procedures for the analysis of insecticidal chemical residues.

5.0394, DISPERSION DURING FLOW IN HETEROGENEOUS POROUS MEDIA

R.A. GREENKORN, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

The immediate objective of this project is to study the theory and measurement of dispersion in heterogeneous anisotropic porous media. A better understanding of dispersion phenomena is necessary to obtain useful flow models of real porous media. Initially, we will study the differential equations associated with dispersion. Present statistical models will be extended to include heterogeneity and anisotropy. Dispersion coefficients will be measured in linear and radial flow in heterogeneous anisotropic media using tracer techniques and these data will be used to determine the statistical range of the dispersion coefficient in view of microscopic and macroscopic heterogeneity, fluid properties, and anisotropy. A better understanding of the fundamental nature and description of dispersion will allow better calculation of miscible flow in porous media. This study of effects of heterogeneity and anisotropy on dispersion has immediate practical application: in tracing seepage of contaminants into underground fresh water; in reclamation of waste water; in underground disposal of chemical, bacterial, and radioactive wastes; in ion exchange; in filtration theory; in the movement of fluids in the human body; and in the flooding of oil reservoirs.

5.0396, EFFECT OF PESTICIDE RESIDUES AND OTHER ORGANO-TOXICANTS ON THE QUALITY OF SURFACE AND GROUNDWATER RESOURCES

E.J. MONKE, Purdue University, School of Agriculture, Lafayette - West Lafayette, Indiana 47907

Laboratory experiments will be utilized to study sorption mechanisms of organo-toxicant materials to mineral and organic fractions in the soil and the movement of these substances through soil profiles. Incubation studies using enrichment culture techniques will be used to isolate microorganisms capable of decomposing those materials which offer the greatest water pollution hazards. Special studies will be made to determine relationships between molecular structure and decomposability of specific toxic substances to determine the feasibility of altering molecular structures. The feasibility of treating reservoirs with special adsorbing or chelating materials in order to flocculate, precipitate, or otherwise deactivate the organo-toxicant materials or their residual decomposition products will be studied using radiological tracer techniques with model filters. Accompanying biological experiments with similar organo-toxicant materials will be conducted in laboratory aquaria to determine the effects of different concentrations and synergisms.

Field studies will be conducted on well characterized, controlled watersheds and associated reservoirs to determine the effects of application practices on pollution hazards. The rate of the applied organo-toxicant materials both on the watershed and subsequently in the small reservoir will be determined possibly using radioisotope tracer techniques. Attention will be given to the development of ready means of detecting the toxic substances or its residue in water storages. Both aquatic and terrestrial indicator organisms will be used to assess the movement and concentration of the organo-toxicant, soil-borne organo-toxicant, or organo-toxicant residue on the watershed and in associated small reservoirs. Samples of water, bottom muds and watershed soils will be subjected to chemical, biological and physical analyses during pre-treatment, treatment, and post-treatment periods for possible organo-toxicant residue and pertinent fauna.

5.0401, FEASIBILITY OF FISH PRODUCTION IN TERTIARY WASTE TREATMENT PONDS

R.W. BACHMANN, Iowa State University, Graduate School, Ames, Iowa 50010

As a means of upgrading the quality of effluents from municipal waste treatment plants, there is much current interest in the use of tertiary treatment ponds where plant nutrients can be removed by algae and organic materials can be further oxidized. We propose to explore the feasibility of raising fish in these ponds. If successful, the returns from the fish culture operation would help to pay for the ponds and at the same time channel some of the waste nutrients into a usable form.

Our objectives are to determine if tertiary treatment ponds are suitable for fish production, to determine the potential production of fish on a pounds per acre basis, to evaluate the economic feasibility of raising fish in these ponds and to determine the role fish have in the dynamics of the ponds.

In the initial experiments channel catfish (*Ictalurus punctatus*) will be stocked in tertiary treatment ponds at Ames, Iowa. Fingerling fish will be used in the early spring and will be harvested in the late fall. Data will be collected on the costs attributable to the fish cultural operation and the marketable value of the fish harvest. Data will also be collected on various physical, chemical, and biological parameters of the ponds.

5.0402, USING SOIL FILTRATION TO REDUCE POLLUTION POTENTIAL OF LAGOON EFFLUENT ENTERING GROUND WATER SYSTEM

C.E. BEER, Iowa State University, School of Engineering, Ames, Iowa 50010

The practice of disposal of animal manure and collection of feedlot runoff in lagoons is being widely used. In most cases Pollution Control Commissions will not permit the direct release of lagoon effluent into surface water streams.

The objectives of this research are to develop land application criteria for the lagoon effluent whereby the quality will be such that pollution potential will be minimal, and the effluent may enter the ground water system. The change in the soil structure, soil chemistry and biological environment will be also studied.

The experimental procedure will involve the sprinkling of lagoon effluent (swine wastes) at controlled rates and frequencies on the experimental area. A tile network will intercept the effluent after infiltration and filtering through the soil and permit the change in quality of the effluent to be evaluated. The soil samples to be studied will be taken directly from the experimental areas.

5.0403, EMPIRICAL PREDICTION OF SAND FILTER PERFORMANCE

J.L. CLEASBY, Iowa State University, School of Engineering, Ames, Iowa 50010

In recent years, there has been a trend to higher filtration rates for sand filters used in municipal water treatment. However, no acceptable rational method has been developed to predict quantitatively the filtering characteristics of a given suspension of solids using a granular filter media. Previous attempts at developing a filtrability index were done with thin filters which measure only surface removal effects and are thus not indicative of the depth removal obtained in a sand filter. Equations currently under study for prediction of the filter behavior have limitations that restrict seriously their usefulness. Data collected in this study should permit proper evaluation of such equations.

The objectives of this study are to develop a standard filtrability index to quantify the filtering characteristics of suspended solids on granular media. A device has been developed consisting of 3 shallow filters of increasing depth to measure both surface and depth removal tendency. Hopefully, a measured index can be correlated to full depth filter performance. Typical filtrability measurements are being made with the device in the laboratory, and at various plants treating waters of different types to test whether a measured index can be used for prediction of plant scale performance. If satisfactory correlation is evident, the device will be suggested as a standard means of measuring filtrability for granular filters.

5.0404, REDUCTION OF HAZARDS ASSOCIATED WITH THE PRESENCE OF RESIDUES OF INSECTICIDAL CHEMICALS IN THE ENVIRONMENT

P.A. DAHM, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

1. Determine the fundamental physical, biochemical, and biological factors influencing occurrence, magnitude, interaction and persistence of insecticidal chemical residues in soils and raw agricultural commodities. 2. Develop basic studies related to the metabolism and detoxication of insecticidal chemical residues in animals, plants, soils, and water. 3. Seek methods of removing or reducing residues of insecticidal chemicals from the environment. 4. Develop and improve analytical techniques essential to the pursuit of this research.

Greatest emphasis will be placed on objective 2, by studying the metabolism of organophosphorus, carbamate, and chlorinated hydrocarbon insecticides in animals, plants, soils, and water. Differences between closely and distantly related species of animals and plants will be investigated as well as intra-specific factors such as age, physiological conditions, and environmental influences. The interaction of insecticides with other synthetic chemicals in our environment will also be explored.

5.0405, AN ECONOMIC ANALYSIS OF ORGANIZATIONS OF WATER USERS

J.R. DAVIS, Iowa State University, Graduate School, Ames, Iowa 50010

Users of water resources often generate 'spillover effects' that affect the cost and/or benefits accruing to other water users. The purpose of this study is to examine ways in which spillover effects that raise the cost or reduce the benefits of affected parties might be reduced or eliminated.

In some cases legislation can force offenders to reduce spillover effects, but since this raises their costs they often successfully resist regulation. We plan to use established methods of estimating costs and benefits to determine when the following types of spillovers are likely to be present. (1) Cases where those who benefit from reduction of spillovers find it worthwhile to pay those creating the spillover to reduce or eliminate it. (2) Cases where all parties to an agreement can gain net benefits that are unattainable if they act individually.

The problems of organizing water users when spillover effects of the variety cited are present will then be examined. At least one pilot study involving water users along a major river in Iowa is anticipated.

5.0407, FARM ANIMAL WASTE DISPOSAL

T.E. HAZEN, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

The objectives are to determine the properties of animal manures and to test and evaluate one or more promising procedures which can be used in the handling, treatment and safe disposal of the farm animal wastes.

Qualitative and quantitative measurements of the physical, chemical and biological properties of swine, poultry and cattle wastes from confinement production units will be taken. Both University and private production units will be studied in this study. Methods of manure treatment and disposal presently under consideration (some already under test) are one- and two-cell lagoons, oxidation ditch and sludge digestion. The effect of waste management in a hog confinement unit will be studied so as to evaluate ventilation and structural design requirements in confinement rearing.

5.0408, DEVELOPMENT OF PULSATING ADSORPTION FILTER FOR TERTIARY TREATMENT OF WASTE WATERS

R.L. JOHNSON, Iowa State University, School of Engineering, Ames, Iowa 50010

In the near future, many of the effluents from conventional sewage treatment facilities will need further tertiary treatment to reduce the organic pollution load entering our waterways. The proposed research will determine the design and operating parameters for a new type of tertiary treatment process, first through laboratory scale investigations using synthetic sewage and second by pilot plant operation of the process on actual secondary sewage plant effluent.

The new process will utilize the adsorption phenomenon of the organic materials onto sand, coal and other media, with the adsorption providing a concentration effect. This concentration of the organic material in the presence of oxygen and biological life allows further bio-degradation of the organic material. The air supply to the process provides the required oxygen for the biological life as well as the pulsating effect needed to prevent clogging of the media beds.

5.0410, TREATMENT OF AQUEOUS AGRICULTURAL WASTES FOR CLEAN WATER AND FOR MICROBIAL PROTEIN PRODUCTION

G.T. TSAO, Iowa State University, School of Engineering, Ames, Iowa 50010

The present proposal concerns a study of a biological engineering process for treating extremely high BOD (biological oxygen demand), heavily contaminated, aqueous agricultural wastes to produce microbial cells, in an unusual culturing vessel known as the Waldhof fermentor. Because of their content of surface active agents, agricultural wastes usually foam excessively when bubbled with air for oxygen supply. Ordinary sparger-agitator type of culturing vessels cannot be used for this purpose due to the high antifoaming demand. The Waldhof fermentor actually makes a virtue of extreme foaming properties and accomplishes high degree of aeration by making use of foam which has a large air-liquid contacting interface. The foam is continuously recycled in the system.

5.0411, THE EFFECTS OF DREDGING AND SILTATION ON DIVING DUCK FOODS AND FEEDING HABITS ON THE MISSISSIPPI RIVER

M.W. WELLER, State Conservation Commission, Des Moines, Iowa

Gather information on population size and feeding behavior of ducks in the Keokuk-Fort Madison Pool.

Populations data will be gathered by counts from shore and boat transect. Aerial censuses will be made during migration periods.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Feeding behavior will be observed from duck blinds and from shore to determine choice feeding areas, depth of water preferred, age and sex composition of flocks and methods of feeding.

Gizzards and proventriculi will be collected and examined for food utilization analysis. Food will be analyzed in the laboratory as to species, volume, percent occurrence and size.

Data on the composition and size of hunter harvest of this Pool will be collected by direct hunter contact. Sexing and ageing of all ducks will be recorded and gizzards removed from birds for laboratory when possible on these contacts.

5.0412, MANAGEMENT OF CATTLE FEEDLOT WASTES R.R. DAGUE, Univ. of Iowa, School of Engineering, Iowa City, Iowa 52240

Previous research has shown that cattle feedlots represent a significant source of water pollution. Anaerobic lagoons have been proposed as a means of accomplishing a reduction in the polluting strength of cattle feedlot wastes through biological decomposition. Fundamental theory indicates that it may not be possible to accomplish a significant improvement in the quality of feedlot runoff by the use of anaerobic lagoons. The supernatant in an anaerobic lagoon is the effluent from the lagoon when additional wastes are added. This research is designed to determine whether or not any significant improvement in the quality of the supernatant liquid occurs after an initial improvement as a result of solids separation.

5.0414, DISPERSION OF WATER POLLUTANTS IN CURVILINEAR FLOWS E.O. MACAGNO, Univ. of Iowa, School of Engineering, Iowa City, Iowa 52240

In a modern, technologically sophisticated society, many rivers are assigned in addition to their natural functions the conflicting roles of serving as sources of fresh water supplies and recipients of the water-borne wastes of urban and industrial areas along their courses. Due to their turbulence and irregular velocity distributions, river flows have a certain capability to disperse and/or oxidize the contaminants that they receive; on the other hand, it is obvious that excessive concentrations of pollutants are intolerable. Hence the increasing interest in recent years in obtaining a better understanding of turbulent mixing in open channel flows.

Two important aspects of the dilution processes have not yet been extensively investigated: the effects of channel curvature and the attendant secondary currents on lateral mixing and longitudinal dispersion, of density differences between the pollutant and the polluted liquids. The first of these is presumed to be the dominant factor responsible for the divergence between laboratory and field values of dispersion coefficients; it is of great practical significance because natural rivers are never straight for more than a few channel widths. Density stratification must play a significant role in cases where the density of the contaminating fluid is different from that of the diluting fluid; this can be inferred from earlier basic research on the effects of density stratification on turbulent mixing.

The proposed research would consist of an experimental and analytical study of the separate and joint effects of channel curvature and pollutant buoyancy (positive and negative) on dispersion in open channel flows, with the goal of developing predictors to enable engineers to estimate better the temporal and spatial dilution that will occur when a particular waste is introduced into a given natural stream.

5.0422, CATTLE FEED LOT WASTE WATER TREATMENT

R.C. LOEHR, Univ. of Kansas, School of Engineering, Lawrence, Kansas 66045

The objective of the project is to evaluate a system that will treat the wastes from beef cattle feed lot operation. Evaluation will be made of treatment efficiency, ability of the system to reduce pollution from runoff and on the potential reuse of the treated wastewater. A system consisting of anaerobic lagoons will

be constructed at a commercial feed lot. The influent and effluent from the lagoons will be routinely analyzed, rate of solids buildup will be determined and possible ground water pollution evaluated.

5.0423, CHEMICAL REMOVAL OF NITRATE FROM POTABLE WATER SUPPLIES

W.J. OBRIEN, Univ. of Kansas, Water Resources Institute, Lawrence, Kansas 66045

High concentrations of nitrate in potable water supplies are both medically and economically undesirable. At the present time controlled removal of nitrate from potable waters is not considered economically feasible. The usual procedure upon discovering high nitrate contamination in a supply has been to seek another source or to simply warn those who might be adversely effected. These approaches are inadequate at the present time and will become even more deficient in the future.

The purpose of this project will be to investigate the removal of nitrate by chemical reduction with air stripping and by ion exchange. Nitrate reduction will be carried out in conjunction with lime-soda softening in suspended solids contact units. Air stripping of the ammonia produced by reduction will be facilitated by the high pH inherent in the lime-soda process.

The nitrate removal characteristics of Type 1 anion exchange resins operated on the chloride cycle will also be evaluated.

An economic evaluation of both techniques will be conducted.

5.0424, OXYGEN CONSUMPTION IN CONTINUOUS BIOLOGICAL CULTURE

W.J. OBRIEN, Univ. of Kansas, School of Engineering, Lawrence, Kansas 66045

The objectives of this research are to measure the rate of oxygen consumption of nutrient limited, completely mixed, activated sludge systems and to utilize these measurements to develop a theoretical basis for the response of these systems to abrupt changes in the influent nutrient concentration.

Hydraulic means residence times in the aeration basin of from three to twenty-four hours are being investigated. Both aeration only and aeration with sludge return systems will be considered.

Preliminary results indicate the existence of a peak rate of oxygen consumption during transition growth periods following an increase in the influent nutrient concentration in aeration only systems. This peak will be of critical importance in establishing aeration design criteria for the recently proposed plants using biological compartmentalization of the influent nutrients followed by chemical flocculation to remove the micro-organisms from solution.

5.0425, EFFECT OF URBANIZATION ON WATER QUALITY

W.J. OBRIEN, Univ. of Kansas, School of Engineering, Lawrence, Kansas 66045

The problem of water quality and contamination by the environment is one of the most challenging areas for research in our society. However, the more specific problem of the effect of urbanization on water quality has been essentially ignored. We propose to examine this problem by investigating the quality of runoff water draining the south part of the campus (U. of Kansas) and exiting down the Naismith channel. The study will include an investigation of seasonal, sudden storm, and dry period effects as reflected in the 10 water quality parameters: Biological oxygen demand, chemical oxygen demand, coliform count (total and fecal), solids content (total, dissolved, and volatile), nitrate, phosphate, pH, temperature, and chloride. Our objectives are: (1) to determine time-distribution of water quality both on a seasonal basis and in response to runoff following a heavy rain-

5. WATER QUALITY MANAGEMENT AND PROTECTION

storm, (2) to determine the feasibility of using urban runoff as a supplemental municipal water source from a water quality standpoint, (3) to compare runoff quality between an open residential area (Lawrence) and a mixed-industrial-city urban area (1 paper in literature), (4) to ascertain whether climatic differences are evident in quality of runoff water (literature presents data for Cincinnati and Leningrad).

5.0426, OPTIMIZATION OF STEP AERATION WASTE TREATMENT PROCESSES

L.T. FAN, Kansas State University, School of Engineering, Manhattan, Kansas 66504

This research involves an analysis, optimization, and process design study of step aeration waste treatment processes. The primary purpose of this investigation is to develop optimal designs and methods that lead to optimal designs for step aeration waste treatment systems.

For each system that is considered, the procedure to be used will involve a definition of objectives, the development of system equations or mathematical model the application of optimization theory to optimize the design variables in the mathematical model, the compilation of solutions, and the definition of the method of attack recommended for that particular system.

A number of types of problems related to step aeration waste treatment process will be approached considering all available optimization techniques, but with special emphasis on the dynamic optimization techniques which include dynamic programming, a discrete version of the generalized maximum principle, a continuous version of the generalized maximum principle and combinations of these.

5.0429, FACTORS INFLUENCING INSECTICIDE RESIDUES ON OR IN FOOD AND FORAGE CROPS

T.L. HOPKINS, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

Objectives: (1) Determine fundamental physical, biochemical, and biological factors influencing occurrence, magnitude, interaction, and persistence of insecticidal chemical residues in soils and raw agricultural commodities; (2) identify and evaluate fundamental factors influencing the magnitude and mechanism of

air and water pollution by insecticidal chemical residues; (3) develop basic studies related to the metabolism and detoxication of insecticidal chemical residues in animals, plants, soils and water; (4) identify and evaluate the effects of residues of insecticidal chemicals on ecosystems with special emphasis on fish and wildlife; (5) develop and improve analytical techniques essential to the pursuit of this research.

Description of Work: The degradation and metabolism of organophosphorus insecticides are studied with reference to environmental effects of solar radiation, temperature, and humidity.

Field studies are in progress to determine potential buildup of insecticide residues in a newly established irrigation district with little previous insecticide exposure. Soil and foliar applications of selected insecticides at recommended rates are applied yearly to corn, sorghum and alfalfa. Soil, water, foliage and certain wildlife species are analyzed at intervals for residues.

5.0430, RELATIONSHIPS BETWEEN PESTICIDAL APPLICATION AND WATER CONTAMINATION UNDER IRRIGATION IN THE GREAT PLAINS

H. KNUTSON, Kansas State University, Graduate School, Manhattan, Kansas 66504

The pesticides to be most commonly used in irrigated areas in the Central Great Plains are applied on a 20 acre experimental field in the Cedar Bluff irrigation District in Ellis Co., Kansas. Various rates of pesticides are applied, along with certain water application rates. Terraces and subdivided terraces constitute individual treatment plots.

Water is analyzed in the residue analysis laboratory of the Department of Entomology at Kansas State University for pesticidal residues taken in wells of various depths within and surrounding the experimental field, in the irrigation ditch as it flows into the field; and in any overflow water resulting from heavy rains.

Soil analysis determines rate of penetration into the soil; toward the well bottoms.

5.0431, LIGAND EXCHANGE REAGENTS

J.L. LAMBERT, Kansas State University, Graduate School, Manhattan, Kansas 66504

Present emphasis is on ligand exchange involving ion association compounds of very low solubility, which are formed between large cations and anions of low charge. When one of the ions is a complex ion and is altered chemically by ligand exchange with an ion from solution, the colored counter ion is released into solution for spectrophotometric determination. A method that has been submitted for publication involves the determination of cyanide ion in the 0 to 8.0 p.p.m. range by reaction of the cyanide ion with triiodide ion of the insoluble tris(1,10-phenanthroline) iron (II) triiodide compound. The released red tris(1,10-phenanthroline)iron(II) cation is determined from its absorbance at 514 millimicrons. A reagent consisting of the insoluble compound between tetraphenylarsonium cation and the complex thorium- Alizarin Red S (1,2-dihydroxyanthraquinone-3-sulfonate) anion shows promise as a direct colorimetric method for small concentrations of fluoride ion. Several reagents for the determination of sulfite ion are under study. Use is made of the selective complexing ability of sulfite ion for mercury (II) complexes to release colored anions from insoluble moniodomercury(II)-dye anion compounds, to release a dye cation from insoluble Methylene Blue-tetrabromomercurate(II) compound, and to release mercury dibromofluorescein from its insoluble compound with trimethylamine ligand.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0432, WATER QUALITY MODELING AND PREDICTION

E.S. LEE, Kansas State University, School of Engineering, Manhattan, Kansas 66504

5. WATER QUALITY MANAGEMENT AND PROTECTION

The primary objective of this research is to apply the recently developed modeling and prediction techniques such as the quasilinearization technique, invariant imbedding, and nonlinear filtering and estimation to establish realistic mathematical models. It will be shown that by the use of these modeling techniques, computational requirements can be reduced and certain experimental difficulties in obtaining the data can be eliminated.

Another objective of this study is to develop and improve the above mentioned techniques for water quality modeling. Since all the modeling techniques to be used are fairly new, further developments and improvements which are especially suited for water quality modeling will be made.

The modeling and parameter estimation of (1) the amount of pollutants in a water stream or river with and without longitudinal dispersion, (2) the estimation of rate constants in waste treatment systems, and (3) dynamic modeling will be studied. Only plug flow situation will be studied in the dynamic modeling.

5.0433, BIOLOGICAL TREATMENT OF BEEF ANIMAL WASTES TO REDUCE WATER POLLUTION

R.I. LIPPER, Kansas State University, School of Engineering, Manhattan, Kansas 66504

Water pollution resulting from cattle feeding operations could be reduced greatly if cattle were reared in confinement on concrete so that wastes could be readily collected for biological treatment. Poultry and swine producers have already demonstrated that confinement rearing is practical on a large scale. Confinement systems for beef production are being investigated. This research proposes to evaluate two systems for the biological treatment of beef cattle wastes. A recirculating oxidation ditch will be operated under a slotted floor for pens holding twenty beef animals in an open front shed. Another shed with capacity for twenty animals will have a solid concrete floor. Manure from the second shed will be pushed into a waste collection hopper at weekly intervals. Waste from the hopper will be fed into a mixed, anaerobic treatment system. Total and volatile solids, BOD and COD will be determined for material fed to each system. The efficiencies and operating characteristics will be determined for each system. The adaptability of the system to cattle management schemes will be evaluated.

5.0435, MECHANICS AND PRINCIPLES OF WATER EROSION AND THEIR APPLICATION FOR EROSION CONTROL IN THE SOUTHERN PLAINS

N.P. WOODRUFF, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

Object: To determine erosion causes, processes and study methods; and the relations between various soil conditions and properties, climate and erosion; to improve erosion prediction methods; to determine soil erosion tolerances; and to develop methods to control erosion and accelerate soil renewal.

Plan of Work: Use will be made of (a) a tower to simulate rain with and without wind, (b) a rain simulator to test erodibility of various soil and cover conditions, and (c) runoff and erosion

records for individual storms. Major research techniques will be developed. Results obtained with rain simulators will be supplemented, compared, and coordinated with comparable field conditions. Study will be made of promising cropping and tillage practices; physical and chemical soil properties; permeability as it relates to erodibility of different soil types; relations between soil conditions, erosion-control structures, vegetative cover, topography, etc., under different climatic conditions, and integration into an improved water erosion equation; new and improved structures (terraces, furrows, crop rows) to control erosion under dryland and irrigated systems; climatic factors and runoff at various locations; and soil erosion tolerances and soil renewal methods.

5.0436, COMPLETE TREATMENT OF TANNERY INDUSTRIAL WASTE FOR CHROME TANNING, ALUM TANNING AND VEGETABLE TANNING

J.R. HOWLETT, Caldwell Lace Leather Company, Auburn, Kentucky 42206

No completely satisfactory method has been devised for treating tannery industrial waste. Since tanneries use large volumes of water, containing organic and inorganic matter, suitable treatment methods must be found.

The objectives of the project are to demonstrate the feasibility of completely treating tannery waste from the only plant in U.S. that tans all three types of leather tannages - Chrome, Vegetable and Alum - and to obtain basic data to design full-scale treatment plants usable for any tannery.

The basic plan is to develop methods to pre-treat the three present leather tannages, to combine their streams, and to completely treat tannery industrial waste. The high alkaline content of beam house waste will be neutralized with high acid made up of various tannages. The organic solids will be reduced in an anaerobic-aerobic lagoon.

5.0438, METABOLIC ROLE OF SULFATES AND SULFIDES PRODUCING BACTERIA IN THE POLLUTION OF WATERS

W.I. ALEEM, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

The proposed investigations involve laboratory and field studies directed at an attempt to determine the effects of metabolic activities of microflora involved in sulfur, iron and nitrogen transformations in the pollution of waters. The work is concerned with the studies of the biochemistry of such processes. The prime sites for initiating such investigations will be creeks receiving run-off from strip mined areas as well as the spoil banks. Any imbalance in the 'normal' sulfur and nitrogen cycle will be equated with the altered environment (either biologically or chemically), in an attempt to shift the environment back to the normal.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

5.0439, ANALYSIS OF SOLUTIONS FOR SURFACE-ACTIVE CONSTITUENTS

H.H. BAUER, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

The behavior of surface-active substances at electrodes will be investigated in order to identify the effects due to the nature of the surfactant, the nature of the electrolytes present, and the relation between these two factors at different concentrations of both types of substances. These studies will be made by the tensammetric method which is well established.

The results will indicate the extent to which such methods can serve for the determination of surfactants in the presence of the wide variety of other substances that one expects to be present in samples of water that will need to be monitored for possible pollution. In addition, it may become possible to treat adsorption processes on a theoretical basis that includes the effect of the presence of electrolytes at the surface; present theories do not take this effect into account.

The applicability of a new technique of greater sensitivity and precision than the tensammetric method will be explored after the main features of the phenomena occurring have been elucidated by the tensammetric technique.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Kentucky

5.0440, ELECTROANALYTICAL CHEMISTRY - STUDIES OF ADSORPTION AND REDOX PROCESSES AT ELECTRODES

H.H. BAUER, Univ. of Kentucky, Graduate School, Lexington, Kentucky 40506

1. Studies of adsorption processes; primarily at adsorption-desorption (tensammetric-peak) potentials, by measurements of distortion induced in applied sinusoidal currents. 2. Influence of so-called inert electrolytes on characteristics of redox processes, to elucidate effects of electrical double-layer. 3. A.C. polarography in aqueous-alcoholic solutions: fundamental studies; decreased sensitivity to small amounts of contaminants.

Applications are foreseen to the monitoring of constituents of natural and polluted waters, both electroactive species and surface-active ones. Tensammetry may provide an empirical overall index of surfactant impurities since this technique detects the presence of the major surfactant independently (or usually nearly so) of the specific chemical nature of the surfactants present.

SUPPORTED BY University of Kentucky

5.0441, DETECTION AND IDENTIFICATION OF MOLECULAR WATER POLLUTANTS BY LASER RAMAN SPECTROSCOPY

E.B. BRADLEY, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

The proposed research is a study of the application of laser Raman spectroscopy in the detection and identification of molecular water pollutants. The primary advantages in such an approach are (1) laser Raman spectroscopy offers a direct method of detection and identification of molecules in water solution or suspension, and (2) the ability to detect and identify high-molecular-weight pollutants.

Laboratory and field investigations will include the following: (a) preparation of standard samples of various industrial and agricultural molecular water pollutants to which Raman spectroscopy is uniquely applicable, (b) use to standard samples to establish levels of detectability, sensitivity limits, and numbers of compounds in representative polluted water samples from industrial effluents that can feasibly be detected and identified by laser Raman spectroscopy at one time without separation techniques, (c) construction and testing of internal-beam-condensing cells, multiple-entrance cells, and laser-cavity cells, (d) sensitivity enhancement of Raman spectra by beam ratioing, (e) develop-

ment of a catalog of standardized Raman spectra of a wide variety of water-soluble industrial waste products divided into the following categories: 1. organic pesticides, 2. petroleum products, 3. detergents, 4. inorganics.

The data will be employed to develop practical applications of laser Raman spectroscopy for the extension of analytical techniques of molecular identification outside the normal capability of GLC and mass spectroscopy.

University of Kentucky

5.0442, PROCEDURES FOR TRACE ANALYSIS OF DISSOLVED INORGANIC AND ORGANIC CONSTITUENTS IN WATER

G.D. CHRISTIAN, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

Various analytical techniques will be exploited for the determination of trace constituents in water.

1. Atomic Absorption Spectroscopy - Methods will be investigated to improve existing sensitivities. A systematic study of organic solvent systems will be conducted to determine the best solvent for each particular metal; acetone appears to offer generally high sensitivity. Thus, methods will be investigated for separating acetone from aqueous solutions via salting-out techniques and for performing solvent extractions with this system. Formation constants and metal/ligand ratios of metal ion complexes with ammonium pyrrolidine dithiocarbamate will be investigated by polarographic techniques. The use of atomic absorption spectroscopy for determining nonmetals in water by indirect methods will be studied.

2. Coulometric Titrations - The feasibility of electrogenerating hydrogen ions in concentrated salt solutions will be studied. Some concentrated neutral salts enhance the activity of the hydrogen ion with the result of certain nonaqueous solvent properties. Variables to be studied include: type of salt and concentration, current efficiency, endpoint detection, types of bases which can be titrated. This system may prove useful for titrating certain trace weak bases in water and bime solutions without the necessity of obtaining them in a non-aqueous solvent.

University of Kentucky

5.0443, ALGAL GROWTH AND DECOMPOSITION - EFFECTS ON WATER QUALITY

E.G. FOREE, Univ. of Kentucky, School of Engineering, Lexington, Kentucky 40506

The proposed study will be basically an extension of a previous study conducted by the principal investigator. The objectives of the proposed study are as follows: 1. To further evaluate a model for calculating the organic composition of algae as a function of the COD/weight ration and the nitrogen content. This will be accomplished by growing algal cultures of varying compositions and comparing directly measured values for the protein, carbohydrate and lipid contents with calculated values. 2. To further evaluate a model describing the regeneration of nutrients (nitrogen and phosphorus) during the decomposition of algae. Specifically, studies will be conducted to extend the model to aerobic as well as anaerobic conditions and to predict the kinetics as well as the extent of nutrient regeneration. 3. To relate the magnitude of the refractory organic fraction (that portion which is resistant to degradation) of a particular algal culture to initially measurable parameters such as DOD/weight ratio and nitrogen content.

Experimental methods will consist primarily of periodic sampling and analysis of algal cultures growing and decomposing under controlled laboratory conditions.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Kentucky

5.0444, FOAM SEPARATION FOR FIELD WATER TREATMENT

R.B. GRIEVES, Univ. of Kentucky, School of Engineering, Lexington, Kentucky 40506 (DADA)

5. WATER QUALITY MANAGEMENT AND PROTECTION

Tech. Objective: Final establishment of and testing of design criteria for a field, water clarification unit to be used by the individual soldier are to be carried out. Criteria include column size and geometry, aerator size and porosity, aeration system, air pressure and air rate, aeration time, surfactant(s), surfactant dosage, and mode of operation.

Approach: Utilizing actual raw waters sampled from a variety of sources with highly variable quality, an actual-size prototype of the field unit is used to establish the ability of the foam separation process to clarify readily any water. The measures of success of the process are the turbidity of the clarified water, the volume of the raw water carried into the foam, and the residual surfactant concentration. Criteria, applicable to the field, are determined to minimize all of these measures.

Progress: Approximately 100 individual experiments have been conducted during the past six months utilizing waters sampled from six different sources in the Central Kentucky area. Using both Cetol (Fine Organics, Inc.) and Adogen 471 (Archer Midland Daniels), surfactants, all samples have been clarified readily and successfully, most within a 20 minute aeration time. Currently, modification of the aeration system to a hand-driven compressor is being initiated, and concurrent disinfection and foam separation are being investigated. Of the eleven final criteria listed in Technical Objective, all but three have been determined.

SUPPORTED BY U.S. Dept. of Defense - Army

5.0445, FOAM SEPARATION FLOTATION OF COLLOID ORGANIC SYSTEMS

R.B. GRIEVES, Univ. of Kentucky, School of Engineering, Lexington, Kentucky 40506

The overall objective of this investigation is the establishment of definite design criteria for specific, continuous foam separation processes. The processes will include the foam fractionation-flotation of colloidal and soluble iron from water supplies, the ion flotation of hexavalent chromium from plating wastes, the foam fractionation of sulfate, sulfite, and lignin-containing wastes from pulp and paper mills, the ion flotation of free and complexed cyanide, and several additional processes, involving specific industrial waste constituents. The processes will be conducted on a batch and on a continuous-flow basis, establishing the efficiencies on the basis of effluent contaminant concentration, and on the quantity of influent lost into the foam stream. For each process an economic evaluation will be carried out, and definite recommendations on the applicability of each process will be made.

Based on previous work and on work currently being conducted, foam separation processes can become a vital part of industrial waste treatment systems. They have excellent potential for water clarification and for iron and manganese removal. This research will enable the design of full-scale processes for specific contaminants.

An additional phase of the investigation will be a feasibility study of the addition of low concentrations of colloidal particulates to wastewaters to enable the foam separation of weakly-surface-active organics.

5.0446, A STUDY OF INHIBITORY COMPOUNDS PRODUCED BY FRESH-WATER ALGAE

D.O. HARRIS, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

The purpose of this study is to examine the biological and chemical properties of inhibitory compounds produced by fresh-water algae (Volvocales). Past experiments by the author have shown a substance produced by *Platydorina caudata* to be: heat labile, non-dialyzable, dilutable several times with no loss in activity, specific for *Platydorina*, unstable at both acid and base conditions and unaffected by short periods of freezing and exposure to bacterial contamination. Studies here will be expanded to include Sephadex, DEAE cellulose, proteolytic enzymes, electrophoresis, etc. in an attempt to isolate and completely characterize these substances.

The study here will be three-fold in nature: (1) a study of substances which are auto-inhibitory in nature, (2) an examination of substances which are not specific for any one organism but

effect a wide range of both animals and plants, and (3) a characterization of the substance and an attempt to learn how they work in order to gain insight as to a method for controlling non-desirous algal blooms. Perhaps this line of investigation will eventually provide clues to a method of controlling algae in water supplies, etc.

5.0449, OIL CONTAMINATION OF OYSTER FROM OIL WELL DRILLING MUDS

A.L. BERTRAND, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

Objectives: 1. To determine the amount of diesel oil present in contaminated oysters. 2. To determine the threshold amount of oil which can be detected by taste or organoleptically. 3. In what areas or organs of oysters the oil is concentrated. 4. The relationship between concentration of drilling mud in sea water to the oil concentration in the oysters.

At times drilling mud has been released into the surrounding areas. If oyster beds are in the vicinity where drilling muds are released such material can slowly settle over the oyster beds. This may cause the oysters to have an oily taste or if the concentration is high enough death of the oysters.

Oysters will be placed in tanks containing bottom mud mixed with oil drilling mud containing tagged hexadecane C14. Samples of oysters will be removed at regular intervals and the amount of oil from the drilling mud will be determined by liquid scintillation spectrometry. This is a cooperative project with the La. Wild Life and Fisheries Commission. The Grand Terre Laboratory will conduct the biological work. The extraction of the oil will be conducted in this Dept. The spectrometry will be carried out in the Nuclear Science Center at La. State University.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0450, SEDIMENT TRANSPORTATION AND BOTTOM CONFIGURATION, AMITE RIVER

V.E. GWINN, Louisiana State University, Graduate School, Baton Rouge, Louisiana 70803

This is the second year of a two-year project. The periods in the annual discharge cycle when maximum depth of scour occurs in bends and crossings will be determined together with gross patterns of scour and aggradation in the channel. Predictions based on the results of current (1967-68) work will be tested by observing the patterns of distribution of clay-organic sediment beneath point bars inside the bends and comparing the facts with forecasts. Data on the scour-and-fill pattern during floods will be used to select optimum periods for installation of channel stabilizing structures, and optimum periods for installation of such structures in bends. On the basis of field work to date, the point bar terrains, clayey at the surface, are predicted to comprise largely sand and gravel in the subsurface.

5.0451, PESTICIDE CONTAMINATION OF THE ENVIRONMENT AND ITS SIGNIFICANCE

L.D. NEWSOM, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

Objectives: (1) To determine the extent to which the environment is contaminated and to develop a continuing monitoring system. (2) To develop more satisfactory analytical techniques and methodology than those which presently exist for residues of some insecticides. (3) To furnish pesticide analytical services to cooperating departments.

Description of Work Proposed. Amounts of insecticide residues currently present will be determined in representative samples of soil, water, bottom sediments, aquatic and terrestrial animals, and plants from five areas differing in ecology and land use. Data obtained will be used as a base line with which all subsequent data may be compared to determine changes resulting from changes in insecticide use pattern. Particular attention will be devoted to developing more satisfactory techniques for determining levels of organophosphorus and carbamate residues as well as any new materials which come into widespread use. Capability for performing analytical work will be increased to the point that pesticide analyses can be done for all cooperating departments.

5.0453, EFFECTS OF WATER QUALITY ON HATCHING SUCCESS

J.S. HUGHES, State Wildlife & Fish Comm., Baton Rouge, Louisiana

Objectives: (1) To determine the effect of water quality on hatching success of striped bass eggs. (2) To determine the effect of water quality on the hatching time and survival of striped bass fry.

Procedure: This job is contingent upon availability of striped bass eggs in Louisiana. When striped bass eggs are obtained, approximately 100 eggs each will be placed directly into one pint hatching jars. Waters of known quality will be used for hatching. As necessary, reference waters will be formulated. Duplicate hatching jars will be used with each water type. Studies will include but not be limited to the effects of temperature, pH, hardness, iron and zinc. Combinations of various chemicals will be evaluated as well as individual parameters. The temperature variations will be from 50 degrees Fahrenheit to 80 degrees Fahrenheit at 5 degree intervals. The pH will be varied from 5 to 9 among the hatching jars. A Hach Colorimeter will be used to determine the concentrations of most chemicals. The percent hatch, time of hatching and five day survival in all jars will be recorded. The various stages of egg development will be examined microscopically to determine when development is affected by the different water qualities.

5.0454, EFFECTS OF CHANGES IN WATER QUALITY ON FRY AND FINGERLINGS

J.S. HUGHES, State Wildlife & Fish Comm., Baton Rouge, Louisiana

Objectives: (1) To determine tolerance limits of striped bass to changes in chemical constituents in water.

Procedures: Striped bass ranging in size from fry to six inches in length will be used for this study. Both gradual and rapid chemical changes and combinations of chemical changes will be tested. These will include but not be limited to hardness, pH, zinc, iron, sulfate, copper, chloride and turbidity.

Standard bioassay techniques will be used. Tests will be run with reconstituted water held at 22 degrees Centigrade. Graduated concentrations of a chemical will be placed in a series of aquaria. The fish will be observed for 96 hours or until death occurs. Concentrations where all fish die, all live and fifty percent live will be reported for each 24 hour period when applicable.

5.0455, A COLOR REMOVAL AND FIBROUS SLUDGE DISPOSAL PROCESS FOR THE KRAFT PAPER INDUSTRY

F. JOHNSON, Continental Can Company Inc., Hodge, Louisiana 71247

The two year project will develop economical design and operation data applicable to the Kraft pulp and paper industry in removal of color in mill effluents, and disposing of fibrous sludges. Color removal will be accomplished by lime precipitation of the color bodies and fibers, with subsequent regeneration of the lime by sludge combustion in a kiln.

5.0456, ENZYMES FOR ANALYSIS AND PURIFICATION OF SALINE WATER SYSTEMS

G.G. GUILBAULT, Louisiana State University, Graduate School, New Orleans, Louisiana 70112

Research will be conducted on (1) the use of enzymes systems for determination of inorganic and organic pollutants in saline water and (2) purification of water by selective enzymatic degradation of toxic materials. The approach involves the investigation by means of electrical and fluorimetric techniques, of a number of enzyme systems for analysis of impurities such as heavy metals, hydrocarbons, phenols and pesticides. In another phase of the work, the efficiency of enzymatic conversion of amines, acids, alcohols and hydrocarbons will be investigated.

5.0457, A LIMNOLOGICAL STUDY OF LAKE PONTCHARTRAIN, LOUISIANA, IN THE SUMMER OF 1968

D.H. STERN, Louisiana State University, Graduate School, New Orleans, Louisiana 70112

A limnological reconnaissance of Lake Pontchartrain, emphasizing chemical and physical dynamics, will be carried out during the summer of 1968. Four cruises (four or five stations per cruise) will be run successively. The cruise stations will be selected so as to sample the summer variability in physico-chemical parameters in the Lake waters. Stations will be established in such locales as river or bayou mouths, canal and sewer outfalls, and offshore lake waters. As soon as one cruise cycle (four cruises) is completed, the next one will be initiated.

Shipboard analyses will include surface, mid-depth and bottom measurements of the following: salinity, dissolved oxygen, light extinction, pH, and alkalinity. Laboratory analyses of surface, mid-depth and bottom water samples will include the following: turbidity, specific conductance, total phosphate, hardness, anionic detergents, nitrate nitrogen, ammonia nitrogen, silica, coliform bacteria presence, chlorophyll a and suspended matter. Additional tests which may be included are those for barium, chromate, cyanide, nitrite, nitrogen, total biomass per liter and plankton per liter. Finally, there will be an attempt to make preliminary determinations of the direction and rate of flow of water currents through the Lake during the summer period.

5.0458, CHLORINATION AND HYPOCHLORINATION OF POLLUTED STORM WATER PUMPAGE

C.J. POWELL, New Orleans Sewer. & Wat. Bd., New Orleans, Louisiana

To control bacteriological pollution in Lake Pontchartrain the project will demonstrate the effectiveness, efficiency, and economics of using open drainage canals as treatment facilities; the effectiveness of chlorine and hypochlorite disinfection on intermittent high flow discharges; and the optimization of various feeding rates, multiple points of application; and control times. Facilities for disinfection will be placed and operated in the St. Charles Canal, the London Avenue Canal and the Orleans Avenue Canal. A sodium hypochlorite blending plant will be constructed and a chlorine alarm system installed. The project will include the provision of appropriate instrumentation for the generation of quantitative and qualitative data necessary for a comprehensive evaluation.

5.0459, COMPILATION OF WATER QUALITY DATA

J.T. DAVIS, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. Secure all water quality data previously collected by all investigators. 2. Compile water quality data secured. 3. Analyze data to determine possible factors limiting striped bass in this area.

Procedures: 1. Contact all agencies taking water quality data on these lakes and their tributaries and secure data. 2. Compile data using ADP equipment presently owned. 3. Compare and analyze data based on reports of striped bass in other areas.

Several components in the instrumentation console for use with the modulated sub-carrier attenuation calibration systems in the frequency range 8.2 - 18 GHz have been constructed. These include an improved 1000 Hz constant-amplitude phase shifter and associated circuitry, a redesigned and improved null amplifier, a 1000 Hz phase detector, and a new driver amplifier for the ferrite modulator.

A new 30 MHz cut-off attenuator has been constructed for the parallel IF-substitution attenuation system. A longer precision

lead screw is used and the input impedance-matching network was redesigned.

Approximately 45 waveguide items have been constructed for the attenuation calibration systems including sliding short-circuits, waveguide tuners, precision waveguide sections, sliding terminations, and a variable attenuator.

Two high-resolution gear trains have been constructed for use with the rotary-vane attenuators.

The period reported upon above is from approximately the starting date of the project given in Box 13 to 311267.

5.0460, REPOPULATION OF EXPERIMENTALLY DECIMATED AREAS BY STREAM FISHES

G.E. GUNNING, Tulane University of Louisiana, Graduate School, New Orleans, Louisiana 70118

An alternative to restocking a stream artificially with fishes following natural decimation by pollution is to allow natural movement of the animals to repopulate a decimated area. The time for this to occur can be expected to vary depending upon environmental conditions and the species of fish in question.

The principal goal of the proposed study is to consider the rate of repopulation of experimentally decimated areas by stream fishes. The proposed study would utilize basic information on five species of fishes already obtained by the writer during the past seven years from three study areas in Louisiana which will be used again.

Segments of streams will be decimated by removing all fish possible in a given stretch. The movement of fishes marked upstream into the center area as well as the samples marked downstream from the central area in each stream will enable us to see the extent of repopulation under natural conditions.

SUPPORTED BY U.S. National Science Foundation

5.0461, BEDDING AND INFILTRATION STUDIES OF SANITARY SEWERS IN THE GULF COAST AREA

F.W. MACDONALD, Tulane University of Louisiana, School of Engineering, New Orleans, Louisiana 70118

The purpose of this project is to determine the best types of bedding arrangements and the most suitable materials to be used in laying sewer pipes in the Gulf Coast areas, including studies on manholes, teir and other appurtenances of sewer systems. A major portion of the project will be infiltration studies using various materials of construction. Some of the studies will be with a testing frame in the University laboratory, while other studies will include field studies of sewer lines in the area.

5.0462, CONTAMINATION OF OYSTERS BY PESTICIDES

F.W. MACDONALD, Tulane University of Louisiana, School of Engineering, New Orleans, Louisiana 70118

The objectives of this project are to determine the concentration factors, the rate of uptake, and rate of decontamination of oysters exposed to radiolabelled dieldrin and endrin; to examine the pesticide interaction with bottom sediments from Wilkinson Bay; to determine the amounts of dieldrin and endrin in Wilkinson Bay Oysters, to compare these amounts with the water, suspended material and bottom sediments in Wilkinson Bay, and to evaluate the environmental effects upon uptake. Data obtained should indicate whether the pesticide concentration in the oysters poses a health hazard to consumers, affects oyster growth, and will provide a base line for future samplings.

5.0463, THE ENGINEERING AND ECONOMIC ASPECTS OF USING SEWAGE EFFLUENT FOR IRRIGATION

C.W. WILSON, Louisiana Polytechnic Inst., School of Agriculture, Ruston, Louisiana 71270

5. WATER QUALITY MANAGEMENT AND PROTECTION

This research project is to investigate the technical and economic feasibility of using sewage plant effluent as irrigation water and will be conducted in Lincoln, Jackson, and Ouachita Parishes.

A review of literature will be made to determine the previous work, the city officials will be contacted and visits to treatment plants will be made. The treatment process at the plants and rate of discharge will be examined and records kept. The physical, chemical, and bacteriological conditions of effluent will be determined. The location of land that could be irrigated with the effluent will be determined. The cost of delivering the effluent to the point of use will be determined and the value of chemicals will be calculated. The cost of irrigation water from alternate sources will be determined and the economic feasibility of each project calculated.

From the references mentioned it is anticipated that this effluent will provide a low cost source of irrigation water. Field use of this resource should improve the economy of Louisiana. Public laboratory facilities, office space, and personal transportation are available to conduct this research.

5.0464, EVOLUTION OF ALLOPATRIC POPULATIONS

W.H. EVERHART, State Inland Fish & Game Dept., Augusta, Maine 04330

Beginning third year of work on this project.

Fertilized brook trout (*Salvelinus fontinalis*) eggs representing all possible crosses among seven distinctive trout populations in Maine were obtained during fall 1966, and are being reared at a local State fish hatchery. Rearing of the resultant young trout will continue through their second summer of life. During this time, studies of egg size, egg development rate, growth and condition of the resulting fry and parr, mortality of fry and parr, morphology and coloration, socio-territorial behavior, stamina, and resistance to unfavorable chemical features of the environment will be or have been carried out. Differences among lots can most probably be attributed to differences in genotype, and the 7 x 7 design of the experiment will allow evaluation of the heritability of the differences found.

An ecological-systematics study of three additional populations of wild brook trout is in progress. This study may show the magnitude of the differences to be expected among trout from deep, cold trout lakes; shallow, warm lakes; and cold, mountain streams.

General morphological and serological investigations of Maine's wild trout populations continue, along with experimental transfers.

5.0466, PHASE II-STUDY OF A RIVER SYSTEM AS A CHEMICAL REACTOR

E.G. BOBALEK, Univ. of Maine, School of Engineering, Orono, Maine 04473

The objective of the proposed work is to develop a mathematical model of an actual river system. This model will be

developed and treated from the point of view of the river as a chemical reactor. A total systems concept will be applied in hopes of developing a practical control scheme which will ultimately optimize the manipulation of the river variables such that optimal water quality control will be attained. The river chosen is the Penobscot river between Bangor, Maine and the Atlantic ocean. While this work considers a typical paper industry river, it is hoped that the resultant model will be extensible to other rivers polluted by industrial and sewage wastes. The means of implementing and manipulating the model is analog, digital and hybrid simulation and control.

5.0468, WATER QUALITY DEGRADATION BY SEPTIK TANK DRAINAGE

M.W. HALL, Univ. of Maine, School of Engineering, Orono, Maine 04473

Both field and laboratory studies will be performed to determine the degree of nitrogen and phosphorus removal that can be expected of septic tank-drainfield wastewater disposal systems. This investigation will provide information relative to the amounts of nitrogen and phosphorus which enter a lake as a result of seepage or drainage from septic tanks located along lake shores. The information obtained will provide authorities with a means for assessing the importance of this form of pollution.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

5.0469, WATER QUALITY ASPECTS OF RECREATIONAL LAKES

M.W. HALL, Univ. of Maine, School of Engineering, Orono, Maine 04473

The extent of nitrogen and phosphorous removal afforded by septic tank - drainfield systems - has not been adequately evaluated. Available evidence tends to indicate that such systems convert insoluble organic and inorganic forms of nitrogen and phosphorous to soluble inorganic forms. It is, therefore, highly probable that septic tank systems can not be expected to effect significant removal of these compounds. The goal of this research is to provide pertinent information on the quantities of nitrogenous and phosphatic materials that enter Maine lakes as a result of septic tank - drainfield practices.

5.0470, STUDY OF STRIPED BASS POPULATIONS IN MAINE COASTAL WATERS

R.W. HATCH, Univ. of Maine, Graduate School, Orono, Maine 04473

Striped bass are becoming an increasingly important sport fish in Maine coastal waters and river estuaries. Intelligent management of this source requires knowledge of the population structure of the species. Present indications are that most striped bass caught in Maine come from a large migratory population. Factors influencing the migratory pattern of this population are not clear, but may include temperature of estuarine waters, variable distribution of preferred food organisms, degree of estuarine

5. WATER QUALITY MANAGEMENT AND PROTECTION

pollution, and variation in offshore currents. Natural spawning sufficient to maintain the known stocks has not been demonstrated in eastern Maine. Lack of spawning populations may be related to head-of-tide dams that restrict access of striped bass to fresh water on most Maine coastal streams. Future efforts will be directed toward identifying the source of striped bass and the factors which determine annual variations in estuarine abundance.

5.0471, THE EFFECT OF SALTS APPLIED TO HIGHWAYS ON THE INFILTRATION AND PERCOLATION OF WATER THROUGH THE SOILS BANDING HIGHWAYS F.E. HUTCHINSON, Univ. of Maine, School of Agriculture, Orono, Maine 04473

The application of chloride salts to highways as a means of ice removal in the northeastern United States has become a widespread practice during the past twenty year period. In Maine alone in excess of 100,000 tons of salt were applied for this purpose during the year 1964-65. The fate of these salts with respect to soil and water resources is not adequately known at present. The nature and extent of their accumulation in the soils bordering highways is to be determined by this project.

Soil samples will be collected from specific sites near highways which have been regularly salted and from the same soils at sites away from highways. Analyses for sodium will be made with a Beckman flame photometer and for chloride by a Dohrmann microcoulometric titrating system. Infiltration and percolation rates for salted and unsalted soils will be made in the field. Snow and water samples will be collected and analyzed to determine the salt concentration of the liquid entering and flowing over the soils near major highways. The project will be started in fiscal year 1965 and terminated in 1968.

5.0474, ADSORPTION OF VIRUSES ON MINERAL SURFACES O.J. SPROUL, Univ. of Maine, School of Engineering, Orono, Maine 04473

At the present time it is known that most small soil particles will adsorb virus particles. There does not exist, however, a rational method for predicting the capacity of soils for viruses.

The minerals to be used in the investigation would be quartz, orthoclase, albite, anorthite, muscovite, biotite, augite, hornblende and olivine. The minerals would be further classified as to expected mode of reaction in accordance with their physical and chemical structures. Bench scale experimentation to yield data for adsorption isotherms would be carried out. The effect of particle diameter would be assessed by separate experiments. The T4 bacteriophage would be used in the initial work as a screening virus. Subsequent work with a fewer number of typical minerals would be done with the Type I poliovirus and with either an adenovirus or a reovirus. Isotherms from the desorption of the virus would also be determined through the use of competing adsorbate. Adsorptive behavior in column studies would be carried out to determine virus breakthrough curves.

5.0476, CHEMICAL CONTAMINANTS FOUND IN SURFACE AND SUBSURFACE WATER AS RELATED TO SOIL AND CLIMATIC CONDITIONS R.A. STRUCHTEMEYER, Univ. of Maine, School of Agriculture, Orono, Maine 04473

The quality of stream water is greatly influenced by the amount and contamination of runoff water. Contamination of the runoff waters is primarily a result of chemical applications to soils and plants and through the weathering of minerals. This contamination could effect human, biological or industrial users.

This study will consist of the analysis of surface waters from existing runoff plots as to mineral elements and pesticides. Mineral elements such as iron, manganese, zinc, chloride and others will be determined by spectrographic, colorimetric and other techniques. Residues of insecticides, fungicides and herbicides will be analyzed by gas chromatography, chromatography, and other analytical methods.

An attempt will be made to evaluate the movement of these materials through the soil as a result of leaching.

Interrelations of climatic and soil characteristics such as soil temperature, precipitation, and soil moisture will be studied.

The present runoff plots are located in Presque Isle, Maine. Samples will be brought to the University of Maine for analysis.

5.0477, INDUCED AIR MIXING OF LARGE BODIES OF POLLUTED WATER S.A. ZIEMINSKI, Univ. of Maine, School of Engineering, Orono, Maine 04473

The Problem: Organic matter of industrial and natural origins tends to settle on the bottom of lakes and other large water reservoirs where it decays depleting the water of dissolved oxygen necessary to ensure normal aquatic life. Although the upper surface of water which is in direct contact with atmosphere may be saturated with oxygen, the mixing resulting from density differences is too small to replenish the oxygen deficiency in the lower layer. The resulting anaerobic conditions lower the water quality. Formation of hydrogen sulfide as well as sulfides of iron and manganese takes place. The carbon dioxide concentration increases and the pH decreases. This anaerobic decomposition can produce undesirable organics, imparting bad taste, odor and occasionally toxicity to the water. The undigested organic matter

5. WATER QUALITY MANAGEMENT AND PROTECTION

piles up on the bottom and gradually the body of water becomes smaller and shallower. Plan of Attack: Introduce compressed air in appropriate places of the body of water. The resulting mixing oxygen supply and improved surface aeration will provide to the whole body of water the oxygen necessary for bio-oxidation of the waste organic matter. In addition to substantial increase in dissolved oxygen the application of this method results in precipitation of iron, reduction in carbon dioxide content, improvement of color, etc. Although this method has a tremendous potential in decreasing pollution of large bodies of water, very little is known about the various factors affecting the efficiency of the system and therefore its optimum design. The Objective: A mathematical analysis has been conducted in our laboratory which resulted in selection of a mathematical model which correlates the rate of mixing, density differences produced by the induced air, depth of immersion of the aerator, etc. A complete experimental procedure has been worked out to check or modify the model. It is expected that this work will allow a successful and efficient design of induced air systems for different shapes, sizes and depths of large bodies of water.

5.0478, WATER QUALITY - BENTHIC INVERTEBRATE RELATIONSHIPS IN ESTUARIES

D. DEAN, Univ. of Maine, Ira C. Darling Ctr. For Res., Walpole, Maine 04573

This project proposes to investigate the relationships between water quality and benthic invertebrates in Maine estuaries. Studies will be conducted in three estuaries, the Penobscot, the upper reaches of the Damariscotta and the Sheepscot, representing heavily polluted, moderately polluted and unpolluted conditions, respectively. Comparable portions of each estuary will be studied to determine the benthic communities present, the settlement of benthic invertebrate larvae, larval metamorphosis, and the growth and survival of juvenile forms. Hydrographic, chemical and geological parameters of the waters and sediments will be measured and used as guidelines for controlled laboratory experiments on larval settlement.

The results of this project should aid 1) in the interpretation of fish distribution patterns in estuaries subject to different levels of pollution and 2) in predicting biotic changes that would occur in an estuary subjected to increased or decreased pollution loads.

5.0479, FLUID FRICTION IN THE PRESENCE OF NON-RIGID BOUNDARIES

J.C. GEYER, Johns Hopkins University, School of Engineering, Baltimore, Maryland 21218

In the presence of thin biological slime layers at the walls of water transmission systems, frictional losses are often observed that are considerably higher than would be expected from the relative roughness of the interior of the conduits.

It is suspected that the biological slime represents an 'active surface,' i.e. a boundary that can be set in motion under the action of fluid flow. Under certain conditions resonance phenomena between the flexible slime surface and the bulk liquid probably account for the high frictional resistance.

The purpose of the proposed study is to investigate the mechanism responsible for this high frictional resistance in the presence of slime layers. Experiments are outlined to determine the functional relationships between the essential parameters. With this information it should be possible to derive criteria for effective control of aquatic slime layers taking into account chemical as well as physical aspects.

5.0482, DETERMINATION OF RESIDUES OF INSECT CONTROL CHEMICALS IN PLANT AND ANIMAL PRODUCTS AND IN SOILS

M. BEROZA, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To determine (1) the amount and distribution of residues on or in plants and plant products, soils, animal tissues, milk, eggs or other animal products as a result of insect control chemicals, (2) breakdown products of such insect control chemicals resulting from metabolic processes in plants and animals or from the action of weathering, and (3) the rate of disappearance of insect control agents or their breakdown products from plant and animal tissues and soils.

Plan of work: Data will be obtained on the rate of deposition and the persistence of residues from the application of new insecticide chemicals. Included will be a wide variety of crops and soils that have been treated directly or that contain residues of chemicals applied to crops grown in the soils. The accumulation and persistence of residues in the fat, organs, and milk of cattle treated directly, or exposed by treating premises or feed crops will be determined. Occasional analyses will be made of tissues from game animals for pesticide residues. Emphasis will be placed on new insecticides that will not cause residues in food crops or animal tissues. Telodrin, dimethoate, dicapthon, phorate, Di-Syston, diazinon, Imidan, Tedion, Ethion and DDVP residues will be studied.

SUPPORTED BY U.S. Dept. of Agriculture

5.0483, AGRICULTURAL SIGNIFICANCE OF CERTAIN TRANSITIONAL ELEMENTS FROM PESTICIDES AND OTHER AGRICULTURAL CHEMICALS

L.A. DEAN, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To develop methods to detect and determine heavy metals of Group II and transition elements in soils and plants; and to study the chemistry of these elements in soil with emphasis on interactions between environmental characteristics such as soil type, fertilizer, moisture, temperature, aeration, and plant species on the availability of these elements to plants.

Plan of work: Analytical techniques will be developed to extract and determine arsenic, copper, cadmium, cobalt, chromium, nickel, hydrargyrum or mercury, plumbum or lead, tin or stannum, and zinc. An extracting technique must be developed that will remove from the soil an amount of the element that is highly correlated with the concentration of that element in an indicator plant growing in the soil. Several chelating agents will be used and evaluated as extractants. Spectrographic or other instrumental or chemical procedures will be studied as an analytical tool in determining concentrations of the extracted elements. Certain problems dealing with the chemistry of these elements will be studied concurrently with the development of the analytical techniques. Environmental factors associated with fixation and availability will be of primary interest.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Agriculture

5.0484, ACCUMULATION AND MOVEMENT OF FISSION PRODUCTS IN SOILS AND PLANTS

L.A. DEAN, U.S. Dept. of Agriculture, *Beltsville, Maryland*

This project seeks ways to reduce contamination of field-grown crops with radioactive fallout. Particular consideration is given to the soil chemistry and plant uptake of strontium-90.

Uptake of radiostrontium by crops may be sharply reduced by burying it deeply in the soil profile in contact with chemicals that inhibit root development in the contaminated zone. Without chemicals, the uptake of radiostrontium from layers buried 20 inches beneath the soil surface in field plot experiments has averaged about half of that from the normal plow depth. When Na_2CO_3 was applied with the buried layer at the rate of 10 tons per acre, the uptake of radiostrontium was only a few percent of the uptake when no chemical was used. Further tests of uptake by crops with different types of root systems will be made, using a large moldboard plow to bury strontium-85 and Na_2CO_3 .

The fixation and exchange reactions of strontium on soil materials are studied for their relevance to uptake. Laboratory studies show that hydrous sesquioxide gels on a kaolinite surface play a role in fixation. The selectivity coefficients of exchange reactions on clay minerals vary somewhat with composition of absorbed cations, whereas the exchange capacities increase with increasing concentration of external solution. Relationships of these effects to an assumed heterogeneous charge density at the clay mineral surface are being investigated.

Absorption of strontium-90 from rain by field crops varies widely between species. In controlled environment, absorption increased with increasing relative humidity and temperature of the air to which the leaves were exposed for 24 hours after an applied radiostrontium solution became dry. Differences between species were related to differences in wettability of the leaves.

SUPPORTED BY U.S. Dept. of Agriculture

5.0485, PESTICIDE POLLUTION OF FARMSTEAD WATER SUPPLIES

R.F. EAGEN, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To assemble information on the use and handling of pesticides on and around the farmstead and to develop methods for preventing entry of pesticide pollutants into farmstead water supplies.

Plan of work: Pertinent information on characteristics of insecticides, rodenticides, herbicides, fungicides, and other such pesticides reaching farmstead domestic water supplies will be collected and assembled by search and monitoring of available literature; correspondence, discussion, and other communication with appropriate Federal and State scientific workers in the health and sanitation disciplines, manufacturers representatives, and others; and by a sampling and analysis program. Field and laboratory studies will be made to trace the routes taken by the pesticides from the point of application, accidental discharge, or waste disposal, to the point of entry into the water source or other point in the supply system. Means for detecting presence of pesticides in water will be studied in an effort to develop equipment, instrumentation, and techniques that would be practical for detection under farm conditions. Exploratory investigations will be made on methods for preventing entry of pesticides into farmstead domestic water supply facilities.

5.0486, ALTERATIONS OF THE PERSISTENCE AND MOVEMENT OF HERBICIDES IN SOIL, WATER, AND PLANTS

J.T. HOLSTON, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To determine the effects of herbicide formulation and placement and of soil management practices in the volatility, decomposition and movement of selected herbicides in soil, water and plants.

Plan of work: Factors influencing the persistence of herbicides will be determined by literature review and laboratory studies; the herbicides will include CIPC, EPTC and TOA. Persistence and movement of herbicides in soil and in growing plants

will be determined by field experiments on a range of soil types. Factors affecting persistence and movement to be investigated include: (1) use of soil additives such as fertilizers and carbon sources; (2) soil manipulation; (3) placement of herbicides on and in soils, and (4) changes in granular and liquid formations of herbicides. The use of fungicides and bactericides to increase persistence in soil will be investigated. Granular matrices and accompanying ions or compounds will be selected to give optimum retention times for given purposes. Granular formulations will be used principally to reduce or increase vaporization losses. The effects of granules on detoxification of microorganisms and on leaching losses will be explored. Similar studies will be conducted with liquid formulations. The use of different solvents and chemical additives will be explored. Sensitive quantitative methods for determination of herbicides will be developed if needed.

SUPPORTED BY U.S. Dept. of Agriculture

5.0487, THE MOVEMENT OF HERBICIDES OFF, INTO, AND THROUGH SOILS

P.C. KEARNEY, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To determine the lateral and vertical movement in soils of known physical, chemical, and mineralogical properties of several herbicides differing in physical and chemical properties.

Plan of Work: The presence of herbicides in and on soil surfaces caused by lateral and vertical movement will be determined in a well defined watershed with detailed past information on cropping history, fertilizer treatments, soil physical properties, climatic conditions, and hydrological data. Soil samples will be taken at 0-2, 11-13, 23-25, and 35-37 inches at least four times a year for chemical analysis to determine the depth of movement of at least six herbicides. Water samples collected from weirs will be taken prior to the application of the chemicals, and at subsequent times thereafter as determined by the amount of precipitation and the amount of runoff. Herbicides in soil and water samples will be assayed using appropriate analytical methods, including colorimetric, spectrophotometric and gas chromatographic procedures. All data will be subjected to appropriate statistical analyses, and correlated with the soil and climatic data pertaining to the areas receiving herbicide applications.

SUPPORTED BY U.S. Dept. of Agriculture

5.0488, CONTROL OF INSECTS ASSOCIATED WITH SWINE PRODUCTION WITHOUT THE USE OF INSECTICIDES

C.M. KINCAID, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To investigate fly and insect propagation under different systems of handling swine wastes and devise effective methods of controlling such insects without the use of insecticides.

Plan of work: Confinement systems of producing swine will utilize methods of handling wastes as follows: (a) an open front, shed-type house with a covered concrete floor, in which manure, bedding and other wastes are scraped and spread on the land at weekly intervals, (b) a completely enclosed, insulated and ventilated housing unit with a partial slotted floor and manure pit for accumulation of waste, which will be spread in liquid state on the land at 30-day intervals, (3) the same type housing as (b) with waste discharged into septic tank and the effluent from the septic tank discharged into an oxidation lagoon, and (d) a confinement unit similar to (b) and (c) above with the waste discharged directly into a lagoon for anaerobic decomposition. Each of the units will be screened. Known numbers of houseflies will be introduced and population buildup observed. Larvae and adult mosquitoes in the lagoons will be evaluated. Wastes spread on the land from units (a) and (b) will be monitored for insect propagation at intervals after each spreading. Detailed records will be kept on all animals--weights, feed consumption, and any departures from normal response or behavior.

5.0489, DETERMINATION AND EVALUATION OF FACTORS AFFECTING WATER RUNOFF AND EROSION IN

5. WATER QUALITY MANAGEMENT AND PROTECTION

THE DIFFERENT LAND RESOURCE AREAS OF THE NORTHEAST

J. LUNIN, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To evaluate the interactive effects of climatic, topographic, vegetative and soil conditions found in the different land resource areas of the Northeast on runoff, soil erosion, and percolation, and to develop and evaluate water management practices for the control of these factors.

Plan of Work: Various soil and crop management practices are being evaluated quantitatively for runoff and erosion losses and their effect on soil physical properties under natural field conditions. Practices such as plow-plant and stubble-mulch seedbeds are being studied along with a more critical evaluation of contouring and the use of diversion terraces. In the glaciated areas of New England, special attention is being given to the effect of rocks and stones on runoff and erosion. Landforming on sloping land is being studied as an aid to contouring for the purpose of eliminating point rows to facilitate mechanization. Rainfall simulators are utilized to permit a more quantitative evaluation of the erosive properties of soils with and without various types of vegetative cover. Results of these various investigations will be utilized to improve existing soil erosion predictive equations so that they will be equally applicable to the various land resource areas.

SUPPORTED BY U.S. Dept. of Agriculture

5.0490, INSECTS ASSOCIATED WITH AQUATIC WEED PESTS OF FOREIGN ORIGIN IN LOUISIANA

R.I. SAILER, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To discover, collect, preserve representative samples, identify, and study the biology of insects associated with aquatic weeds; and to evaluate their potential for control of such weeds.

Plan of work: The work will consist of the following: (1) conduct surveys throughout the year in major ecological areas of Louisiana, to determine what insects and related arthropods feed on alligatorweed, water hyacinth, and parrot's feather; (2) collect all species of arthropods found associated with the weeds; (3) properly prepare specimens in order that they may be identified; (4) conduct basic biological studies of those insects apparently capable of suppressing the weeds in the field, small concrete or metal tanks, and in aquaria in the laboratory; (5) preserve samples of developmental stages of the insects studied under number 4 above together with a record of the conditions under which the specimens are found.

Grant project with the Louisiana State University and A&M College.

SUPPORTED BY U.S. Dept. of Agriculture

5.0491, METHODS OF ANALYSIS FOR INSECT-CONTROL CHEMICALS

M.S. SCHECHTER, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To develop methods of analysis for insecticides, attractants, repellents or other insect-control chemicals and for their residues, metabolites, or breakdown products in crops, soils, animal tissues, and milk.

Plan of work: When an insect control chemical has shown sufficient promise so that ENT plans to evaluate it with a view to recommending it for use, a method to analyze the chemical compound and its residues or metabolites will be developed, when necessary. The chemical and physical properties of the compound and the various reactions it can undergo in order to find characteristics that are specific and permit quantitative measurement will be studied. For example, such a characteristic might be reaction with certain reagents to give a colored product measurable by a spectrophotometer at a definite wavelength, quantitative reduction at a specific electric potential, or passage through a gas chromatograph column under definite conditions in a specific time interval. After a suitable colorimetric reaction or other characteristic has been found, the optimum conditions for precise and accurate measurements in the desired concentration range will be established. Suitable procedures also will be developed for the extraction and cleanup of samples, including plants, soils, fat, milk, etc., to be analyzed for residues by a given method.

SUPPORTED BY U.S. Dept. of Agriculture

5.0492, PATHOGENS AS BIOLOGICAL CONTROL AGENTS FOR MOSQUITO LARVAE

C.H. SCHMIDT, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To search for, identify, and study pathogens including viral, fungal, bacterial, protozoan, and/or nematode infections which affect mosquitoes and study their potentiality as biological control agents for larvae or adults.

Plan of work: The contractor shall be responsible for conducting all of the research outlined in this line project. Surveys of natural mosquito breeding areas will be conducted to locate mosquito populations infected with pathogens. Samples of these populations will be collected and returned to the laboratory to determine: (1) Species of mosquitoes which are infected, (2) types of species of pathogens causing infection, and (3) an estimation of the degree of infection of the natural population of mosquitoes. Studies will be conducted in the laboratory to determine the life cycle of pathogens (virus, fungus, bacterium, protozoa or nematode), the environmental factors influencing their development, and the mechanisms by which these pathogens infect mosquitoes.

SUPPORTED BY U.S. Dept. of Agriculture

5.0493, DISPERSAL OF CONCENTRATED OR UN-DILUTED INSECTICIDES FOR IMPROVED MOSQUITO CONTROL

O.H. SCHMIDT, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To evaluate aerial applications of concentrated or undiluted sprays of insecticides for the control of mosquito larvae and adults, with particular emphasis on the effectiveness of different formulations and the economy of this method of application in irrigated agricultural lands in California.

Plan of Work: The contractor shall be responsible for conducting all the research outlined in this line project. Formulations of insecticides known to be effective in the control of mosquitoes and possessing physical characteristics suitable to low volume dispersal will be developed. Existing aerial spraying equipment will be evaluated for the dispersal of undiluted or highly concentrated insecticides. Modifications of existing equipment or the design of new equipment will be undertaken to obtain the most satisfactory dispersal of this type of formulation. The effectiveness of different formulations in controlling mosquito larvae and adults, which are produced in irrigated agricultural areas, will be evaluated under field conditions in California. Studies will include the effects of air speed, heights, and flight patterns on effectiveness of mosquito control and effects on other insects in the area.

SUPPORTED BY U.S. Dept. of Agriculture

5.0494, COMPARISON OF VARIOUS FORAGES FOR AGRICULTURAL WASTE WATER DISPOSAL

J.H. AXLEY, Univ. of Maryland, School of Agriculture, College Park, Maryland

Various amounts of waste water from an agricultural processing plant will be applied with a sprinkler irrigation system to several forage species. Forages to be compared are pure stands of Kentucky 31 tall fescue, reed canary-grass, orchardgrass, and sudangrass; and a mixture of Alsike clover, Ladine clover, and tall Fescue. A fallow plot will be included. The forages will be harvested several times each year and evaluated for yield and content of N, P, K, and possible waste contaminants. Plant vigor and persistence will be observed. The infiltration rate with which the water enters the soil under the different treatments will be measured. The soil will be analyzed biennially for pH, P, K, organic matter, and soluble salts.

5.0495, KINETIC STUDIES OF THE OXIDATIVE DEGRADATION OF DETERGENT, AND RELATED CHEMICAL SPECIES IN AQUEOUS SOLUTION

R.B. BECKMANN, Univ. of Maryland, School of Engineering, College Park, Maryland

5. WATER QUALITY MANAGEMENT AND PROTECTION

This is a joint research effort of the Department of Microbiology and Chemical Engineering to study the fundamental biological, and physical-chemical and engineering aspects of the biodegradation process for LAS detergents and to explore the similar fundamental aspects of alternative oxidation routes. Phase I is to be investigated by utilizing a pure (insofar as is possible) LAS derivative, such as A- Dodecene Benzene Sulfonate (or other alkyl derivative in the C12-C15 linear alkyl range) and investigate the rate of degradation in 'synthesized' systems; the systems being 'synthesized' in that the LAS, bacterial, and dissolved oxygen contents will be controlled and the intermediate products and end products will be continually monitored. Once the specific intermediate products have been identified, rate studies will also be carried out using these intermediates as starting materials. By utilizing the 'synthesized' reaction systems in this initial stage, a 'control' or 'ground state' can be established for extension of the kinetics into the realm of industrial or multicomponent mixtures, and it will also serve as a comparative base for the second (II) and concurrent phase of the project. The last concentration range covered will be that anticipated in normal effluents 10-1000 parts per million with ultimate extension to the more concentrated regions that might be encountered in sludges.

5.0496, OXYGENATION KINETICS OF REDUCED SULFUR SPECIES

F.B. BIRKNER, Univ. of Maryland, Graduate School, College Park, Maryland

It is anticipated that the proposed investigation will supply much needed kinetic and stoichiometric information concerning the oxidation of reduced sulfur species by molecular oxygen under conditions which exist in natural water environments. The project has been designed to determine the order of the reaction kinetics and the effects of pH, ionic strength, temperature, and specific metal cations on the rate of the oxidation reaction. Preliminary calculations, based on recent polysulfide equilibrium data, indicate a significant change in the distribution of reduced sulfur species with pH when both monosulfides and polysulfides are considered to be present simultaneously in a reaction mixture. This effect has never been considered before but may have an important bearing on the pH dependence of the overall oxidation rate of reduced sulfur species. This hypothesis will be tested experimentally.

5.0498, EFFECTS OF THERMAL POLLUTION ON PRODUCTIVITY AND STABILITY OF ESTUARINE COMMUNITIES

J.A. MIHURSKY, Univ. of Maryland, Natural Resources Institute, College Park, Maryland

A multidisciplinary investigation is proposed to study thermal pollution of an estuarine community. Laboratory studies of

behavioral, metabolic and growth responses to heat stress will be integrated with field experiments to evaluate the overall impact of thermal pollution on an estuarine ecosystem.

Specifically, the laboratory phase will study representative species from the phytoplankton and planktonic herbivores. Growth of algae and intrinsic rates of increase of copepod populations will be used to evaluate thermal stress separately and when other environmental components are varied. At the same time, survival, behavior and metabolism of vertebrates and macro-invertebrates will be measured in gradients of temperature and salinity.

Field experiments will determine the influence of heat pollution on several trophic levels. Rates of mortality, biomass turnover or production and energy flow will be used to evaluate the impact of pollution. An ideal field situation has been provided by the newly constructed electrical generating plant at Chaik Point on the Patuxent river estuary.

The field experiments may be divided into those which test the direct effect of the passage of a part of the estuary through the power plant. The indirect effect of effluent water on the planktonic community adjacent to the power plant may be determined by correlation and comparison with pre-existing patterns of biomass, production and species structure of the plankton. Similarly, pre-pollution-phase measurements of vertebrate and macro-invertebrate standing stocks may be correlated and compared with those existing under thermal pollution.

5.0499, DISPOSAL OF WASTE FROM SWINE FEEDING FLOORS TO MINIMIZE OR ELIMINATE STREAM POLLUTION

W.F. SCHWIESOW, Univ. of Maryland, School of Agriculture, College Park, Maryland

A septic tank system will be constructed for disposal of wastes from a swine feeding floor to prevent effluent from such floors polluting streams. The effectiveness of such a system will be evaluated for its ability to reduce the biochemical oxygen demand (BOD) of such wastes and to dispose of the wastes by distribution through an underground tile disposal field. Data to be collected will include sludge buildup in the tanks and the gradients of distribution through the soil and the gradients of BOD reduction. The effectiveness of the septic tank and underground disposal system will be compared to that of a lagoon for which three years' operation history is available and which will be continued in service.

5.0501, WATER QUALITY CRITERIA TO PROTECT THE FISH POPULATION DIRECTLY BELOW SEWAGE OUTFALLS

C. TSAI, Univ. of Maryland, Natural Resources Institute, College Park, Maryland

The proposed research plan is to establish water quality criteria to protect fish population directly below the sewage outfalls in streams. The criteria will be used as one measurement of sewage pollution assessment and control.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Field investigation will be made at about 120 secondary sewage treatment plant outfalls throughout the State of Maryland during the summers of 1968, 1969 and 1970. At each plant outfall, two stations (one upstream and one downstream, each 300 yards from the outfall) will be designed for determining the water quality (DO, CO₂, ammonia, pH, temperature, turbidity, conductivity, nitrite, nitrate, phosphate, and chloride ions) and the fish population (species diversity and fish abundance). The degree of water quality degradation and the degree of fish population depletion by sewage effluents in a stream will be determined from their difference between two stations. Water quality criteria will be established from the relationship between the degree of water quality degradation and the degree of fish population depletion at all plant outfalls studied.

5.0503, SYSTEM STUDY, DESIGN, AND EVALUATION OF THE LOCAL STORAGE, TREATMENT, AND REUSE OF STORM WATER

C.W. MALLORY, Hittman Associates Inc., Ellicott City - Columbia, Maryland 21043 (14-12-20)

A comprehensive study was made to determine the economic and technical feasibility of using system for the local storage, treatment, and reuse of storm water as a method of providing pollution control. With this concept, storm water runoff is collected in small reservoirs dispersed throughout urban communities, treated to remove pollutants and is either released to receiving bodies of water or further treated for reuse. The benefits derived from the reuse of storm water are used to offset the cost of pollution control.

As part of this study, a synthesized hydrograph using mathematical expressions derived by regression analysis techniques were used to predict the runoff from ungauged watersheds following urban development. A system analysis technique was used to evaluate the various combinations of system components, possible plant locations, and quality and quantity of reuse. The systems were optimized by computer techniques based on a net system cost given local site conditions as constraints. The cost of pollution control by conventional means and the value of the reused water were taken as benefits.

Four systems were considered for application to the Wilde Lake watershed in Columbia, Maryland. Three were based on the local storage concept with (1) potable reuse, (2) sub-potable reuse, and (3) pollution control only. The fourth system was a design for pollution control of the same area using conventional design approaches and methods. For the Wilde Lake watershed, the local storage and treatment system for potable reuse was found to be the most economical system. The local storage system for pollution control would have a slightly greater net cost than the potable reuse system. The sub-potable reuse system and conventional system were found to be considerably more expensive systems.

This program included the development of plans, schedules, and cost data for the demonstration of the local storage, treatment, and reuse of storm water and for the collection and analysis of data on urban hydrology.

5.0504, MODEL ADVANCED WASTE-TREATMENT PLANT

A. MACHIS, Washington Suburban San. Comm., Hyattsville, Maryland

The objective of this project is to design and construct a 5 mgd advanced waste treatment plant at the Commission's Piscataway Wastewater Treatment Plant to demonstrate the high efficiency removal of phosphorus, BOD, suspended solids and refractory organics. The AWT plant is planned to consist of lime precipitation, lime recovery, recarbonation, filtration, activated carbon adsorption, and activated carbon regeneration.

Research by the Federal Water Pollution Control Administration and others has shown the feasibility of attaining improved removals of carbon and phosphorus from municipal waste discharges. The work has been primarily in the laboratory and small pilot plants; now it is ready for larger pilot scale or full-scale operation. The Piscataway Plant is a particularly appropriate site because of joint FWPCA-WSSC cooperation in AWT and because of the interest in water pollution problems in the Potomac Estuary.

5.0506, PHYSICAL AND CHEMICAL CHARACTERISTICS OF THE UPPER CHESAPEAKE BAY

W.N. SHAW, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Physical characteristics (temperature, current speed and direction, tidal fluctuations, exchange rates and volumes) of local waters and in large man-made salt water ponds are being and will be determined. Chemical characteristics (salinity, oxygen, phosphate, nitrate, etc.) of local waters and in artificial ponds will also be determined. Information provides baselines to evaluate effects of environmental extremes on commercial shellfish in natural waters and in laboratory experiments.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0507, POTENTIAL OYSTER SETTING CAPACITY - LOCAL AREAS

W.N. SHAW, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

This project is concerned with the setting capacity of oysters in local waters, principally the Tred Avon River, Broad Creek, and Harris Creek, on the Eastern Shore of Chesapeake Bay in Maryland. Yearly, stations are established in each area, and dur-

5. WATER QUALITY MANAGEMENT AND PROTECTION

ing the oyster setting season (June to October) collectors in the form of oyster shells and asbestos flexboards are put out at each station. Total amount of setting and period of setting intensity are measured by counting daily and weekly the number of oyster spat on these collectors. In addition, the amount of fouling competitors for space is studied.

Studies on the rafting of shells to catch seed oysters are being conducted. Rafts are being placed in areas where setting intensity has been high. Shells on strings and in bags are being suspended from the rafts during the setting season. Once the seed is caught they are removed from the rafts and suspended from a rigid structure to grow to market size. The long line method to catch and grow seed oysters is to be tested in several areas.

5.0508, SOURCE CONTROL OF WATER TREATMENT WASTE SOLIDS

D.D. ADRIAN, Univ. of Massachusetts, School of Engineering, Amherst, Massachusetts 01003

Water treatment wastes consisting of filter wash water and sludge are discharged back to the raw water source by over 90 per cent of the nation's water treatment plants. Lagoons are sometimes used for concentration of these wastes, especially sludge. Dewatering and drying beds, while commonly utilized in wastewater treatment, are infrequently employed for water treatment waste solids concentration prior to final disposal.

Characterization of sludge by its solids content, specific resistance and coefficient of compressibility has enabled the researchers to develop a new formulation which describes dewatering. Verification of the model with lab scale tests has been very promising and these tests will continue. Incorporation of evaporation into the model is underway.

The filtration and evaporation processes are both subject to moisture contents and gradients in the accumulated solids, the soil and the atmosphere. The proposed research will relate these factors to the dewatering and drying rate by establishing moisture transport rates. Design criteria for land disposal of water treatment sludge, liquid manure, garbage and other moist or wet wastes will be developed.

5.0509, THE EFFECTS OF PESTICIDE RESIDUES ON LARVAL AND JUVENILE WINTER FLOUNDER IN THE WEWEANTIC RIVER ESTUARY, MASSACHUSETTS

C.F. COLE, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

Saltmarshes and their meandering estuarine streams too often have been considered a biological wasteland and public apathy has allowed these areas to become targets of developers of waterfront properties and uncontrolled use of pesticides. The estuarine environment is breeding ground for commercial and sport fishes and little data are available concerning the influence of pesticides upon their general life history. A program was recently established to obtain detailed data on the interaction of pesticides in the estuarine area of the Weweantic River on the northwestern shore of Buzzards Bay. The pesticide investigation will study the possibility of acute toxic conditions occurring from single instances of pesticide application. As the occurrence of parathion in the estuary is ephemeral at most, and, as parathion is one of the major insecticides now used on cranberry bogs, this study is of major significance. The objectives of this project are to study the larval blackback flounder mortality under controlled laboratory conditions; to study a comparative larval mortality in three widely separated geographical areas; to conduct bioassay studies which will delimit tolerance levels, especially for blackback larval flounder; and to conduct a more critical study of the occurrence of area specificity, as evidenced in previous chromatographic patterns.

5.0510, INVESTIGATION OF THE RELATIONSHIP OF THE AMERICAN SMELT, OSMERUS MORDAX - MITCHILL, TO THE WEWEANTIC RIVER ESTUARY, WAREHAM, MASSACHUSETTS

C.F. COLE, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

Saltmarshes and their meandering estuarine streams have too often been considered a biological wasteland and public apathy has allowed these areas to become targets of developers of waterfront properties. The estuarine environment is an important area as spawning grounds for many commercial and sport fishes and a program has been established on the Weweantic River estuary to determine age and growth, feeding habits, fecundity, adult movement, larval and young-of-the-year distribution of the more abundant species. One such species is the American smelt.

More than 750 ripe smelt were taken during the period 10 March - 6 April. The peak of the run -- determined from numbers taken -- occurred during the week of 16-22 March and then rapidly tapered off.

Smelt larvae were taken for the first time on 11 April along the upper four kilometers of the estuary. Water temperatures had reached 10.0 degrees Centigrade at the spawning site and gradually decreased downstream to 7.4 degrees Centigrade where the river flows into Buzzards Bay. Subsequent weekly sampling trips yielded larvae at all seven permanently established stations within the estuary. The more downstream specimens were longer and more developed than those secured at the more upstream sites. Intensive sampling with a variety of equipment failed to provide collections of smelt after they had attained a total length of about 20 mm. Evidently, this problem is a familiar one to many investigators who attempt to follow the development of a particular species within estuarine environments. Perhaps three explanations are adequate to explain this phenomenon: (a) high rate of mortality at this stage of development thus fewer numbers are available; (b) the size of the smelt is such that they may actively avoid capture; (c) the net movement of young smelt is into Buzzards Bay where a constant environment, sufficient food, and deeper water is available for development.

5.0512, EFFECTS OF CHEMICAL IMPURITIES IN WATER DISINFECTION BY HALOGENS

T.H. FENG, Univ. of Massachusetts, School of Engineering, Amherst, Massachusetts 01003 (DA-49-193-MD-3036)

Tech. Objective - To investigate (A) the effect of chemical impurities on the bactericidal activities of halogens in aqueous solutions and (B) the odor and taste produced in the process of halogenation.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Approach - Calcium, iron, phosphate, and one surface active agent will be the chemical impurities to be investigated in the initial phase of the study. *E. coli* will be used as the test organisms. Temperature will be maintained at 25 degrees C, and pH controlled at 5, 7, and 9. Halogens to be used will be chlorine, bromine and iodine. Odor and taste determinations will be made in parallel with the disinfection experiments.

Progress - Oct 66 - Jun 67 - During this period studies have been of a fourfold nature. In the first place the disinfection efficacy of free chlorine residual alone in water has been established in connection with exposure conditions of temperature, contact time, dosages and pH which would afford reproducible and significant experimentation with chemical additives. Secondly, similar experiments have been initiated with free bromine residual. Thirdly, the effects of calcium bicarbonate on the disinfection efficacy of free chlorine residual have been investigated. Lastly the taste threshold concentration of free chlorine residual in water at pH 5.0, 7.0 and 9.0 has been studied. The basic death kinetics of *Escherichia coli* under specified conditions using free chlorine residual, and to a lesser extent free bromine residual, as the disinfectants, have been established. Calcium bicarbonate, at a concentration of 610 milligrams per liter as calcium carbonate, was found to affect the bacterial cell resistance to, and the disinfecting properties of free chlorine residual in the destruction of *E. coli* cells.

5.0515, MICROBIAL INTERVENTION IN THE EUTROPHICATION PROCESS

W. LITSKY, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

The objectives of this project are: (1) to relate the microbial decomposition of lake sediments to the release of materials required as nutrient by phytoplankton and (2) to tie-up these nutrient materials in bacterial cells by manipulating the bacterial flora or the aquatic ecosystem.

Further, the purpose of this study is to investigate the processes by which the nutrients that are recycled from the bot-

tom muds are liberated by microbial activity and to find ways whereby these soluble nutrients may be utilized before they become available to algae. In other words competition for the soluble nutrients by a microbial flora other than that involved in the eutrophication process, may be a means of limiting the growth of the undesirable algae species.

5.0516, REVERSE OSMOSIS TREATMENT OF WASTEWATERS

R.T. SKRINDE, Univ. of Massachusetts, School of Engineering, Amherst, Massachusetts 01003

Removal of pollutants from water by reverse osmosis has great potential as a new, efficient, and economically feasible method of wastewater treatment. The process has been investigated primarily as a method of desalination of sea water, and only recently has any attempt been made to apply reverse osmosis to the treatment of municipal and industrial wastewaters.

The purpose of this research is to obtain data needed to evaluate and apply reverse osmosis as a process for the treatment of wastewaters. In particular, an improved understanding of the mechanism of separating organic materials from water is essential to development of more suitable membranes and better geometric design of reverse osmosis cells.

The objectives of this study are to: a. Obtain data essential to development of design parameters, including data on liquid diffusion rates, efficiency of separating organic pollutants, and cell operating characteristics for presently-available membranes utilizing waters containing selected organic and inorganic chemicals. b. Apply the above data in developing membrane separation techniques for advanced treatment of organic industrial wastes and municipal sewage. In addition to the development of membranes and cells specific to wastewater treatment, this phase of the investigation will consider systems in which reverse osmosis may be utilized in conjunction with such chemical additives as activated carbon and polyelectrolyte coagulant aids. The systems developed will be tested on municipal sewages and industrial wastes.

5.0517, TRANSPORT AND FATE OF POLLUTANTS IN SOIL

H.A. THOMAS, Harvard University, School of Public Health, Boston, Massachusetts

Develop mathematical models describing the movement of liquids in unsaturated porous media to delineate the critical factors in design and utilization of soil systems for waste water treatment and disposal or waste water reclamation.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0518, OCCUPATIONAL AND ENVIRONMENTAL HEALTH

J.L. WHITTENBERGER, Harvard University, School of Public Health, Boston, Massachusetts

The basic objective of this research program is to gain a better understanding of the relationship of man to his physical and chemical environment. Specific areas of interest include classical problems of barometric and thermal stress, but major attention is focused on pollution problems which have come to the fore in the past decade or so. These include the biological effects of atmospheric pollution, the effects of pesticides and other food residues, and the effects of body burdens of radionuclides and other chemicals.

The methods used in studying the effects of environmental variables emphasize biochemical and physiological approaches rather than those of classical toxicology or pathology. A considerable range of test systems has been used in the past and we intend to expand these. Examples of biological systems already used are microorganisms, cell fractions from various vertebrate species, cultures of human tissues, isolated organs, and whole animals (with particular emphasis on the respiratory, renal, and hepatic systems).

5. WATER QUALITY MANAGEMENT AND PROTECTION

In terms of intensity of environmental stress, we aim to study the concentrations required to induce changes in the most sensitive biochemical and physiologic tests we can devise for the system of interest. Oftentimes such concentrations occur in industry and occasionally in communities. We are equally interested in the possible effects of long-standing low-level exposures, as occur in ordinary atmospheric pollution or water and food contamination. The methods used are those of chronic disease epidemiology, and here we are particularly dependent for advice and assistance on our colleagues in biostatistics. We look to our colleagues in physical science for help in measurement of the environmental exposure.

5.0519, THE CONSTRUCTION OF THE STORM DETENTION AND CHLORINATION STATION

H. WHITMORE, Metrop. District Commission, Boston, Massachusetts 02108

The storm detention and chlorination station is being constructed for the treatment of storm water overflows from the combined sewage system of the cities and towns bordering on the Charles River Basin. The proposed installation will be capable of handling a maximum of 230 million gallons per day of excess flow from the new and old sewerage systems. Consisting of screening and pumping facilities, chlorine dosing and detention facilities and skimming and flushing facilities, this installation will be fully automatic and will become an integral component of the overall sewage control program for Metropolitan Boston. A comprehensive sanitary survey of the Basin is now underway and will be followed up by correlation of operation data with rainfall; frequency and extent of overflows; physical, chemical and bacteriological analyses of influent and effluent; regrowth of coliforms; effectiveness of chlorination and solids removal with measurements of solids return to sewer; effectiveness of the double-sided overflow weirs in relief conduits; effectiveness of effluent diffusers into Basin and overall unit cost studies relating to operation, utilization and performance of the installation. Scheduled to be under construction in the Fall of 1967, the facility will be in preliminary operation in the Fall of 1969.

5.0520, STUDIES IN FOAM SEPARATION AND RELATED TECHNIQUES

B.L. KARGER, Northeastern University, Graduate School, Boston, Massachusetts 02115

The distribution factors of several metal ions have been measured as a function of HCl concentration for a foam separation process. Measurements have been performed on a recycling batch foaming apparatus. Using a cationic surfactant, hexadecyltrimethylammonium bromide, maxima in distribution factors have been obtained at 1N HCl for Hg and 8N HCl for Fe. Thus, by adding controlled amounts of HCl selective removals of metallic species can be achieved. It is also worth pointing out that distribution factors have been measured as low as 10 to the minus twelfth power M metal ion concentration, and results indicate that foam separation techniques are effective at this level. These studies can be of value in deciding conditions necessary for use of foam separation techniques as in-plant clean-up procedures for industrial wastes. Studies are also underway in examining the extraction mechanism involved in solvent sublation. The results of this study will be presented at a later date.

5.0521, GROUND-WATER CONTAMINATION FROM HIGHWAY SALTING IN MASSACHUSETTS

S.J. POLLOCK, U.S. Dept. of Interior, Water Resources Division, Boston, Massachusetts

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Massachusetts.

Purpose: To define the hydrologic principles relating to the movement of highway salt into and through the ground.

Methods: Ground-water sampling stations will be set up in a variety of geologic and hydrologic environments along several major highways. If possible, sites for sampling stations will be selected where previous studies have described a portion of the hydrology and geology of the area. Also, soil samples will be taken from selected depths above the water table at these sites in order to trace the path and rate of movement of the salt both vertically and horizontally.

5.0524, DEGRADATION OF SEWAGE AND SOIL MICROORGANISMS

R. MITCHELL, Harvard University, Graduate School, Cambridge, Massachusetts 02138

It is proposed that a project entitled 'Enzymatic degradation of sewage and soil microorganisms by a marine microflora' be initiated. The research would entail a study of predation by the indigenous marine microflora on those microorganisms carried into the sea as sewage or in run-off water. An attempt will be made to evaluate the significance of enzymatic degradation in the eradication of sewage and soil microorganisms from the sea. Special emphasis will be placed on the decomposition of *Escherichia coli*.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0525, PHOSPHATE EXCHANGE WITH SEDIMENTS

W. STUMM, Harvard University, Graduate School, Cambridge, Massachusetts 02138

The proposed study is a part of a broad investigation on chemical factors in limnological transformations of phosphate. It is proposed specifically to investigate the kinetics of the reaction $\text{CaCO}_3 + \text{HPO}_4^{2-} \rightarrow \text{CaHPO}_4 + \text{CO}_3^{2-}$ (Ca-Phosphate Apatite).

A better knowledge on the distribution of phosphate between the sediments and the overlying waters is relevant for interpreting the eutrophying effect of phosphates introduced into a receiving water. The results of such an analysis should also be of predictive value in establishing whether and how fast the process of eutrophication can be reversed by reducing the introduction of phosphate bearing wastes into the receiving waters.

5.0527, MOVEMENT AND MIXING OF WATER INJECTED INTO AQUIFERS

D.R. HARLEMAN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

The research program is concerned with the replenishment of ground water aquifers by injection of water through recharge wells. The injected water may be a treated waste effluent or it may have other water quality characteristics, such as salinity, which differ from the native ground water. The primary objectives are to determine the quality of water pumped from the aquifer after mixing and dilution due to the recharge.

The movement and mixing of the injected water is affected by the natural flow existing in the aquifer and by the flow pattern induced by the injection and pumping wells. A single well may be used both for injection and pumping on an alternating basis. It is desired to develop analytical methods for the prediction of mixing and dilution for various boundary conditions and for both steady and unsteady flow fields. The distribution of concentration of any material introduced into the aquifer by means of the injection well is to be determined by numerical solution of the convective-dispersion equation. Longitudinal and lateral dispersion is considered in addition to the mass transport by the convective motion.

The influence of density variations due to dissolved salts on the mixing of injected water will be studied in the final stage of the research programs.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0528, MECHANICS OF DISPERSION IN ESTUARY POLLUTION

D.R. HARLEMAN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

A basic study of estuary dispersion in an oscillating flow with fresh water throughflow superimposed. Extension of Taylor analysis of longitudinal mixing in estuary type flows. Study of similitude of distorted estuary models in regard to distribution of pollutants in fresh water region of the estuary. Numerical solution of the dispersion equation in a variable area estuary. Experimental and analytical investigations were conducted on longitudinal mixing in a pipeline with a throughflow superimposed on an oscillating flow. Exact solutions to the dispersion equation were found for both instantaneous and continuous injection of pollutants into an estuary -type flow and both were verified experimentally. It was found that the equation representing the concentration distribution of a continuously injected pollutant must include the tidal or oscillating velocity. The similitude of distorted estuary models in which dye is injected as a tracer was investigated. The results indicate that concentration similitude is not obtained in distorted Froude models. Current investigations are concerned with numerical solutions for variable area estuaries which account for non-linear effects in the tidal convective motion.

5.0529, GROUND WATER DISPERSION DURING PUMPING AND RECHARGE OPERATIONS

D.R. HARLEMAN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

Development of a general numerical method for the solution of ground water dispersion problems in a steady, two-dimensional flow field. Emphasis is on the development of an efficient finite difference scheme for digital computer application. Investigation includes dispersion between separate recharge and pumping wells and pumping and recharge operations in the same well at different periods of time. The research programs also include consideration of dispersion in non-homogeneous (layered) media. Applications are in the field of ground water contamination. Approximate analytical solutions have been obtained for dispersion in steady, radial flow from a well and for flow between a recharge and a pumping well. The general finite difference formulation for digital computers has been developed. This program may be used for any steady, two-dimensional dispersion problem. The numerical scheme expresses the convective-dispersion equation in curvilinear coordinates consisting of the streamlines and equipotentials. Analytical results have also been obtained for dispersion in layered, non-homogeneous aquifers. Current research is concerned with cyclic pumping and recharge from the same well and with the effect of small density differences between injected and natural ground water.

5.0532, SELECTIVE NITRATE AND PHOSPHATE REMOVAL

J.D. SMITH, Process Research Incorporated, Cambridge, Massachusetts (14-12-179)

The objectives of this proposed research program are: 1. To investigate an ion exchange membrane system for selective removal of nitrates and phosphates. 2. To determine the initial feasibility of this system. 3. To develop a preliminary design rationale for the proposed system, and 4. To estimate the potential effectiveness and economics of such a system in waste water nutrient removal applications.

A laboratory scale nitrate and phosphate removal system, using exchange membranes will be constructed. Nitrate and phosphate transport rates will be determined with this system, using commercially available anion exchange membranes. Parameters which will be examined will include: 1. Driving force, or chemical affinity. 2. Concentrations. 3. Flow velocity, and 4. Membrane type.

5.0533, THE PERSISTENCE, ACCUMULATION AND FATE OF PESTICIDES IN CRANBERRY SOILS AND RESERVOIRS

C.W. MILLER, Univ. of Massachusetts, Agricultural Experiment Sta., East Wareham, Massachusetts 02538

The objectives of this project are the study of pesticides in relation to their 1) accumulation and persistence in the area of application, 2) movement from the point of application to the

5. WATER QUALITY MANAGEMENT AND PROTECTION

water, and 3) final destination and concentration of pesticide chemicals used on cranberry bogs.

Preliminary investigations will be made on the chlorinated hydrocarbons, since these are known to resist breakdown to a greater degree than organic phosphates and many analytical procedures have been developed and are available. As information on these compounds is accumulated, similar studies will be made on the organic phosphates which may require the development of new techniques for determination.

Soil samples at varying depths will be taken in cranberry bogs, ditches and reservoirs. In addition, perennial vegetation, algae and water animals will be collected and analyzed when possible. This information will provide a base line from which further studies may be made in relation to future chemical application.

5.0534, (U) BIODEGRADABILITY OF DETERGENT COMPOUNDS

M. ROGERS, U.S. Army, Natick Laboratories, Natick, Massachusetts

Technical Objective - Carry out research on biodegradable detergents to support procurement user elements, evaluate unique N Labs synthesized compounds, determine mode of action of biodegradation of experimental detergents and determine suitability of detergents for specific army germicidal items.

Approach - Biodegradability of compounds is determined through activated sludge, river die-away, shake flask and Warburg procedures. Breakdown of the compounds are followed by pertinent chemical analyses. New techniques are developed as required.

Progress - (Apr 65) Nine purified samples of sodium (thia-n dodecyl) benzene sulfonate anionic detergents were evaluated against non-sulfur-containing biodegradable standards in river die-away tests. Four of the nine are highly biodegradable, while the other five are slowly biodegradable. The relationship of chemical structure to biodegradability is being investigated. Newer biodegradable detergents, to be included in the formulation for disinfectant, chlorine, food service, have been evaluated by the activated sludge techniques required by West German law. A series of 26 sulfur substituted dodecyl benzene sulfonates are being studied to establish structure-bio-degradability relationships. Gas chromatographic techniques are being developed to follow the biodegradation of specific compounds. A paper concerning some of the sulfur compounds has been on the program of the Army science conference. A given military standard for biological test procedures for biodegradable detergents has been reviewed. Biodegradability of machine working fluids is under study.

SUPPORTED BY U.S. Dept. of Defense - Army

5.0535, STUDY OF LOCAL WATER CONTAMINATION PROBLEMS

W.J. LACY, Merrimack College, School of Engineering, North Andover, Massachusetts 01845

Technical Objectives: Complete the development and programming of a water contamination model for predicting the potential radiological hazard from drinking water, including considerations of fallout solubility, fractionation, induced activity in soil, over-land transport of radioactivity in runoff, water treatment decontamination, biological uptake, and human critical organ radiation doses for different periods of water consumption.

Approach: a. Complete the one-dimensional activity transport model, expand it to two-dimensional transport, and apply the developed models to runoff contamination calculations. b. Investigate the amount of contamination due to erosion, and calculate activities transported in sediment and colloidal suspensions. c. Update previous calculations of water supply contamination by incorporating recently revised values of solubility nuclide contour ratios. d. Applying these contamination calculations to selected water supply systems of interest to OCD.

Progress: January 68-June 68: An analytic solution was obtained for kinematic flow over a plane with time-dependent up-

stream boundary conditions. The infiltration routine was completed to incorporate ponding and pre-ponding conditions. It is being modified to accept tabular data on soil types. The erosion and sediment transport model was completed. The biological uptake routine was reprogrammed and used to recompute critical organ doses from ingestion of drinking water contaminated by direct fallout deposition in the reservoir system of Providence R.I.

5.0540, ENVIRONMENTAL CHANGES IN LAKE ERIE

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Lake Erie has experienced major changes in the benthos and fish populations. Analyses of physicochemical data show that concentrations of most major ions have increased significantly, very low dissolved oxygen concentrations occur during the summer, and mean annual water temperatures have increased. Present studies are directed toward documenting the extent of change in the benthos and studying the factors which result in the oxygen depletion of the hypolimnetic waters. Laboratory and field studies are being made of the exchange of nutrients and the oxygen demand at the mud-water interface.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0541, PHYSICAL LIMNOLOGY OF THE GREAT LAKES

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The major effort in this project is directed toward an understanding of currents, ambient irradiance, and temperatures and their importance to the distribution and behavior of fish. Drogue studies of surface currents are being carried out in Lakes Erie and Superior. The usefulness of airborne radiometers and infrared scanners for detecting water masses and surface currents is also being investigated. These methods were used in Lake Erie in 1963. Bathythermograph and reversing thermometer temperatures collected during 1954-55 are being used to describe the thermal regime of Lake Michigan. Thermal data are being or have been collected in the other Great Lakes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0542, CHEMICAL CHARACTERISTICS OF THE GREAT LAKES

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The long-range objectives are to gain an understanding of the cycles of the major nutrients in the Great Lakes and connecting waters and their influences on the productivity of the lakes. Objectives are to demonstrate the vertical, horizontal, and seasonal variations in water quality in various habitats of the lakes. Routine determinations are being made on a variety of Great Lakes waters for sodium, calcium, magnesium, potassium, sulfate, chloride, silica, alkalinity, pH, dissolved oxygen, and total phosphorus.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0543, REMOVAL OF PESTICIDES FROM FRESH-WATER FISH

R.H. GNAEDINGER, U.S. Dept. of Interior, Technological Laboratory, Ann Arbor, Michigan

Collection of various species of fish and proximate and pesticide analyses is in progress, as well as for a study of their rendering characteristics. Studies on pesticides emphasize the lowering of these materials in fish as a result of processing or rendering. Planned feeding studies on a separate project, to determine the effects of an experimental fish press-cake on mink growth and reproduction, will include pesticide considerations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0544, MONITORING OF PESTICIDE LEVELS IN THE GREAT LAKES

R. REINERT, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

A monitoring program to measure levels of insecticides in various species of fishes and water from each of the five Great Lakes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0545, RATES OF PESTICIDE BUILDUP IN SALMONIDS RECENTLY INTRODUCED IN THE GREAT LAKES

R. REINERT, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

A program to follow the buildup of insecticides in lake trout and coho salmon that have recently been introduced into Lakes Michigan and Superior. The eggs and fry will be studied before the fishes are introduced into the lakes and then as these populations develop they will be sampled periodically. When the fishes reach maturity their eggs and progeny will be examined for insecticide levels.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0546, MECHANISMS OF PESTICIDE ACCUMULATION IN AQUATIC ORGANISMS

R. REINERT, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

A laboratory program designed to compare the relative importance which direct uptake of insecticides from water and biological magnification via the food chain have on the buildup of chlorinated hydrocarbon insecticides in aquatic communities.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0547, A COHERENT-AREA STUDY OF SOUTHERN LAKE MICHIGAN

J.C. AYERS, Univ. of Michigan, Institute of Sci. & Technology, Ann Arbor, Michigan

The work proposed involves a team-approach to the sedimentary, biological and chemical indications of the eutrophication process in the southern portion of Lake Michigan. This Great Lakes water body is a water resource of present value, and future greater value, within which the effects of man's wastes are becoming evident. The studies would assemble and assess the indications of eutrophic change with the aim of determining the onset of and the present rate of deterioration of water quality.

Related basic studies of the present sedimentary process and present sedimenting materials, along with needed basic studies of the weather-modifying effect of Lake Michigan would also be carried out.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0548, LONG-TERM EFFECTS OF PESTICIDES ON AQUATIC INVERTEBRATES

M.E. BENDER, Univ. of Michigan, School of Public Health, Ann Arbor, Michigan

The long-term effects of parathion and endrin exposure to aquatic invertebrates are being studied under continuous flow conditions. Test organisms include: the stonefly *Acroneuria*, the caddisflies *Hydropsyche* and *Chimarra*, the dobsonfly *Corydalus* and crustaceans *Asellus* and *Gammarus*, measurement of effects is being evaluated by: mortality rates, growth, time of molting, success of emergence and reproduction success of crustaceans.

The acute and chronic effects of the hydrolysis products of malathion, parathion, and sevin are also being studied.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Michigan

5.0549, SAND FILTRATION OF DISCRETE SUSPENSIONS

J.A. BORCHARDT, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

This research is a continuation of a laboratory study on sand filtration. New techniques have been developed for media placement which have resulted in extremely reproducible head loss values under similar flow and impurity levels. This had made possible the extension of our work into regions of low turbidity.

5. WATER QUALITY MANAGEMENT AND PROTECTION

The magnitude of the surface charge effects can now be separated from other gross bed response factors and hopefully a better insight into the filtration mechanism will result.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0550, ORGANIC DECOMPOSITION AT POISED O-R POTENTIAL LEVELS

J.A. BORCHARDT, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

This research effort will continue along three major paths, each of which will contribute to the total understanding of the importance of electrode potential measurements to anaerobic digestion.

Two banks of laboratory digesters, consisting of three units in each bank, are being used to study the effects of chemical poisoning as compared to electrical poisoning.

Dual compartment digestion units are being used with dialysis membranes separating the acid forming from the methane forming bacteria. In one such unit mixed cultures are being studied, while in the other, pure cultures of methane organisms are being fed through the membrane by mixed cultures of acid formers. Electrode potentials and other parameters are being observed.

The third phase of the study involves the use of a conical head digester to determine the instantaneous response of the unit in terms of gaseous components to perturbations as predicted by the results obtained in phases 1 and 2 of this study.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0551, INTERACTIONS OF PESTICIDES AND SEDIMENTED OILS

R. HARTUNG, Univ. of Michigan, School of Public Health, Ann Arbor, Michigan

The major objectives of this proposed study are to investigate interactions of pollutants; specifically, the interactions of chlorinated hydrocarbon insecticides in water with sedimented polluting oils. Sedimented polluting oils have been found to exist in a number of widely separated areas with histories of oil pollution. On a theoretical basis, these oils should be capable of concentrating organic chemicals with low water solubility, e.g. chlorinated hydrocarbon insecticides. The specific major goals of this proposed study are: 1) The determination of the physical concentrating capacity of naturally occurring sedimented polluting oils for low concentrations of chlorinated hydrocarbon pesticides in rivers and lakes. 2. The investigation of the biological availability of chlorinated hydrocarbon pesticides once they have been concentrated by sedimented oils.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0552, MINERAL-WATER CHEMISTRY, GREAT LAKES

J.R. KRAMER, Univ. of Michigan, Great Lakes Research Division, Ann Arbor, Michigan

Great Lakes chemistry, relative to major ions, is evolved from a time independent invariant chemical equilibrium model(s). The ability to rigorously define these models rests upon knowing free energy expressions for the specific minerals and aqueous ligands, the crystallography and stoichiometry of the minerals, and the in situ chemistry of the Great Lakes.

Solution equilibrium among end member solid phases permits determination of free energy of formation of the common minerals. This procedure is applied to synthetic simple composition minerals and naturally occurring minerals. Equilibration is considered attained when identical results are achieved for different paths of equilibration.

Standard chemical, X-ray diffraction, and optical techniques are used to define solid phases. Knowing specific solid phases allows one to 'equilibrate' the entire specimen and compare results with those predicted by single solid phase equilibrium studies.

Ultimate goodness of fit is achieved by comparing apparent equilibrium expressions obtained from data for the Great Lakes to the above models. Since parts or all of the Great Lakes are not in the same environment as the analytical laboratory, emphasis must be placed upon in situ or pseudo in situ analyses.

5.0553, DISSOLVED OXYGEN DETERMINATION IN NATURAL AND WASTE WATERS

K.H. MANCY, Univ. of Michigan, School of Public Health, Ann Arbor, Michigan

The proposed work is concerned with the development of new electro-chemical techniques using voltammetric membrane electrodes for the trace analysis of dissolved oxygen. Potentiostatic as well as galvanostatic methods are used and evaluated under field conditions. The effect of interferences commonly present in natural and waste waters are being also investigated.

5.0554, A DETAILED STUDY OF LAKE MICHIGAN PLANKTON DIATOMS

E.F. STOERMER, Univ. of Michigan, Great Lakes Research Division, Ann Arbor, Michigan

The major objective of the proposed study is to provide a systematic account of the plankton diatom flora of Lake Michigan. The investigation will be based on both modern collections and historic collections from the period of record. Records of abundance and distribution of the entities will be developed, in so far as is possible, for the period of record. Nomenclature used in previous studies will be reviewed in an attempt to make these records useful to the non-specialist.

5.0555, EFFECT OF WATER TEMPERATURE AND/OR DISSOLVED OXYGEN REQUIREMENTS ON SELECTED MOLLUSKS

H. VANDERSCHALIE, Univ. of Michigan, Graduate School, Ann Arbor, Michigan

Eight species of gastropods representing a variety of habitats, ability to survive within several ecological situations, susceptibility to pollution, and significance in the food chain have been selected for study: *Physa gyrina*, *Lymnaea stagnalis appressa*, *L. emarginata*, *Helisoma trivolvis*, *H. campanulatum*, *Goniobasis livescens*, *Pleurocera acuta*, *Amicola limosa*.

The temperature tolerance for short periods of time will be determined for the eight species listed above. Three principal factors of several are involved; tolerance to sudden temperature changes, acclimation rates, and upper physiological limits. These three factors will be tested in a manner to separate their importance. An animal migrating or swimming down a river is subject to sudden temperature change at the mixing zone; sensitivity will be tested in this parameter. Rate of acclimation tests are important for ascertaining how fast a temperature changes without adverse effect on the animal, and upper physiological limit ascertains maximum limit of temperature change without death.

Further growth rate over a wide range of temperature changes, freezing, to barely possible survival limits will be investigated. Thus, rate of growth at optimum temperature will be determined. Finally, studies will include the effects of various elevated temperatures on the reproduction of the snail.

This contract was started Fiscal Year 1968-69 and is scheduled to end 1971-72. Quarterly reports are to be submitted to the contract officer in order to keep him posted on the progress of the study. All raw data will be furnished in a final report so that no data are lost for future reference and study.

5.0556, FLUIDIZED EXCHANGE SYSTEMS FOR REMOVAL OF NITROGEN AND PHOSPHOROUS FROM WASTEWATER

W.J. WEBER, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

The primary objective of this research is the evaluation of the suitability of fluid-bed ion exchange systems for removal of inorganic nutrients - nitrates and phosphates - from sewage effluents. These materials are largely responsible for acceleration of eutrophication in lakes and reservoirs, and development of ion-exchange methods for their removal from wastes prior to

5.0557, INTERACTIONS OF SILICA WITH IRON AND ALUMINUM

W.J. WEBER, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

The proposed research is directed toward the following objectives: (1) To examine in detail the possible interactions between Fe(III) and Al(III) and monomeric and polymeric forms of silica in experimental systems closely representing natural waters in chemical constitution, for the purpose of delineating the nature and character of complexes formed between the metal ions and various dissolved and colloidal silicate ligands. The studies will consider both kinetic and equilibrium aspects of the formation of such complexes. (2) To investigate the effects of major systemic variables such as hydrogen-ion concentration, alkalinity, and concentrations of other multivalent metal ions (e.g. Ca plus 2, Mg plus 2) on the formation of iron-silica and aluminum-silica complexes, both as to the nature of the complex formed and as to the extent of complexation. (3) To relate the findings from studies carried out under phases (1) and (2) to definition of the specific role of silica in the formation of metal complexes in natural waters and to the application of resulting principles to the coagulation and treatment of water. Further, to evaluate conditions under which silica can be most effective in aiding coagulation.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0558, ADSORPTION FROM AQUEOUS SOLUTION

W.J. WEBER, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

The present research is directed toward definition of the characteristics of adsorption of organic materials from dilute aqueous solution. It has direct bearing on the problem of removing biochemically resistant synthetic organic substances from waters and waste waters. The kinetics and equilibria of adsorption in columns of fluidized adsorbent are being investigated in terms of uptake profiles relative to the velocity dimensions, time and length, for selected values of the latter parameters, for various particle sizes of adsorbent, for different adsorbents, and for solutions of varied chemical constitution.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0559, SYSTEM MONITORING AND REMOTE CONTROL

G. REMUS, Detroit Board of Water Comrs., Detroit, Michigan

The project consists of installation of new power operated diversionary overflow structures and automatic control instrumentation. The instrumentation includes devices for determination of waste water quality, flow measurement, rainfall data, conduit liquid level sensing, and remote operation diversion gates. Telemetry will be provided to transmit and record data collected by the instruments and to provide feed-back data relative to status of the remote controlled units. Investigations will be made to observe the modifications and additions to the system, to analyze and evaluate the data collected, and to determine the overall effectiveness of the demonstration.

5.0560, PILOT-SCALE STUDY OF IMPROVED PHOSPHATE REMOVAL BY MODIFIED ACTIVATED SLUDGE PROCESS

G. REMUS, Detroit City Government, Detroit, Michigan

The primary objective of this project is to determine the most suitable and economically feasible treatment process for the continuous removal of at least 80% of soluble phosphates from the wastewater of a large municipality. The process must also be com-

patible with treatment for removing a high percentage of suspended solids, phenols, oils, and bacteria, and reducing BOD. By restricting the supply of phosphates to Lake Erie, the growth of algae in the Lake may be slowed and the life of the Lake lengthened.

The most promising tests will be subjected to large-scale pilot plant studies to determine their suitability for use in large treatment plants. Of importance will be the follow-through on sludge disposal to determine the adequacy of sludge thickening, dewatering, and incinerating devices for delivering the phosphates taken up by the sludge, and to keep them from the plant effluent.

5.0561, GREAT LAKES RESEARCH - SPOIL DISPOSAL EFFECTS

A.P. PINSACK, U.S. Army, Lake Survey, Detroit, Michigan 48226

Physical, chemical and biological factors within the water mass and associated solid material which can be related to dredging and disposal of spoil material are being investigated in order to determine effects of this material on characteristics of the lakes. The study will examine changes in water characteristics, dispersion rates, and areal extent; changes in nature of bottom sediments from dumping and dredging and degree to which characteristics of these sediments are improved; and different effects of various dredging techniques on pollution.

Field investigations during 1967 centered on eleven selected rivers, harbors, and open water and diked disposal areas of different basic types in Lakes Erie, Huron, and Michigan. Inasmuch as data on actual levels of pollution which can be traced to various kinds of dredging is lacking, each area was studied before, during, and for a significant period after dredging and disposal of spoil material.

Interim reports for each study area are being prepared and a comprehensive report is scheduled for completion in 1968.

SUPPORTED BY U.S. Dept. of Defense - Army

5.0562, INDICATOR-PATHOGEN DENSITY RELATIONSHIPS IN TRIBUTARY STREAMS

R.M. TWEDT, Univ. of Detroit, Graduate School, Detroit, Michigan 48221

Since 1885 when Escherich described his 'Bacillus coli' as a species characteristic of human feces, the enlarged coliform group of bacteria has been used as an indicator of fecal pollution. In a continuing effort to improve the sanitary significance of the coliform group, many investigators have developed physical and biochemical procedures which could differentiate coliform strains isolated for the feces of warm-blooded animals from saprophytic strains associated with soil and vegetation. In recent years, researchers have shown the intimate association of certain groups of streptococci with human feces. According to presently accepted interpretation, the parallel determination of both fecal coliform and fecal streptococci concentrations in surface water established the presence and relative degree of pollution. In addition, it has recently been suggested that the ratio of fecal coliform to fecal streptococci concentrations will illuminate the source of nature of the pollution.

The object of the proposed investigation will be to characterize the relationships that exist among bacterial indicators and pathogens in a small, surface tributary. The study will achieve this objective by making an intensive quantitative determination of the densities of coliforms, fecal coliforms, fecal streptococci and Salmonella existing under all nutrient and environmental conditions found along the course of a representative stream and also by studying the survival of these organisms in filtered and unfiltered stream water samples. The resulting data would contribute 'new' information since no previous study has contributed a quantitative characterization of the relationships existing between indicators and pathogens along a flowing water course. The value of this proposed investigation would be derived from the increased sanitary significance imparted to the determination of indicator concentrations as a measure of water quality in natural rivers and streams.

5.0563, ECOLOGY OF PESTICIDES IN AN AQUATIC ECOSYSTEM

R.C. BALL, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Objectives: To develop methods of accurately evaluating the effects of low levels and chronic input of pesticides in an aquatic habitat. This will include a study of the pathways and mechanisms of movement through the aquatic ecosystem, and identification of biotic effects at each trophic level.

The work will be carried out in three locations: (1) the laboratory of Fisheries and Wildlife Department. Here the precision, reliability, and specificity of 'stress' analysis technique will be tested on insecticides in two artificial streams. The criterion will be changes in the mobile fraction of the plasma proteins in the type of fish (and invertebrates) found in both cold and warm-water habitats. (2) A field duplication of the above tests will be made using fish from areas known to be contaminated by pesticides. This will be carried out on the Red Cedar River, Michigan. (3) This phase will be carried out at the Lake City Experiment Station where heavy applications of pesticides have been used for several years. Here in a series of experimental ponds, we will study the movement of the toxic materials from the soil into the ponds and there follow them through the organisms that constitute the food chain leading to game fish eaten by man--with special emphasis on the accumulation at each trophic level.

SUPPORTED BY U.S. Dept. of Agriculture
Michigan State Government

5.0564, FARM ANIMAL WASTE DISPOSAL

J.A. DAVIDSON, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Objectives: 1. Characterization of the physical, chemical, and biological properties of livestock and poultry wastes. 2. Improvement in management systems with regard to handling, treatment and disposition of the wastes.

The electro-osmosis principle of drying animal and poultry manure will be investigated. The amount of electrical current and the design of and material used in the electrodes will be studied. The time required to dry the material and the amount of moisture remaining in the material when the system stops operating will be determined. The water removed and the residue will be analyzed. Bulk density of the manures and the orientation of the electrodes will be investigated.

The use of air, mechanical agitation, and pumping (circulating) will be investigated as a means of increasing aerobic digestion. This will be accomplished in small tanks with controlled amounts of the manure added daily. In addition one or more full scale tanks in pens with a high density population will be used.

5.0565, TOXIC ACTION OF WATER SOLUBLE POLLUTANTS ON FRESHWATER FISH

P.O. FROMM, Michigan State University, School of Medicine, East Lansing, Michigan 48824

Fish subjected to chronic low level stress (hexavalent chromium and forced exercise exhibited a transitory increase in plasma cortisol which returned to control levels after one week exposure. Animals treated with exogenous cortisol by implanting pellets in the body cavity had plasma cortisol levels of over 100 micrograms. Fasted fish so treated had elevated liver glycogen and excreted more waste nitrogen than controls. Plasma glucose was not elevated. Animals similarly treated but fed during the experimental period had liver glycogen stores and nitrogen excretion rates similar to controls. A seasonal variation in plasma cortisol levels of untreated trout was found.

Rainbow trout were placed in solutions of ammonium chloride containing 0,1,3,5 and 8 micrograms ammonia

(total)/ml. After 24 hours' exposure the blood levels for total ammonia showed a direct linear correlation with ambient ammonia and ranged from 38 to 71 micrograms/ml. Expressed in terms of non-ionic ammonia (NH₃): fish exposed to 0 to 1 micrograms ml had blood levels which ranged from 0.06 to 1.3 micrograms ml. The daily excretion of total waste nitrogen showed an inverse relationship with starting ambient levels of ammonia as did the data for excretion of ammonia nitrogen. The relatively greater decrease in ammonia nitrogen excretion over total nitrogen excretion in fish exposed to the higher concentrations of ammonia suggests that excretion of other nitrogenous compounds occurred to partially compensate for decreased ammonia nitrogen excretion.

5.0566, BIOCHEMICAL AND ECOLOGICAL RELATIONSHIPS OF PESTICIDES AND THE BIOLOGICAL CONSTITUENTS OF AQUATIC COMMUNITIES

G.E. GUYER, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Studies of interdisciplinary nature are proposed to evaluate the amount, storage, build-up and release of pesticides under varying biological and chemical conditions. Studies on methods of contamination and levels needed to produce injury, debility, sterility or mortality will be conducted under controlled conditions. The physiological effects of pesticides on energy exchange will be measured at the cellular level. Direct bioassay and gas chromatography will be employed to follow the movement and monitor the accumulation of pesticides in aquatic systems. A study will be initiated to determine the site of damage and the identification of effects of detergents, metallic ions, BOD and other chemicals. Areas of concentration in the trophic system, rate of transfer, buildup and exchange within the biota of aquatic systems will be determined.

SUPPORTED BY U.S. Dept. of Agriculture

5.0567, RELATIONSHIP OF PESTICIDES IN SOIL, WATER AND PLANTS

G.E. GUYER, Michigan State University, Graduate School, East Lansing, Michigan 48824

SANCLEMENTE

The identification of real or potential hazards to human health or ultimate human satisfactions has been an essential aspect of this pesticide investigation. Sorption of pesticides by clay minerals, soil microorganisms and soil materials of varying organic matter content were studied to elucidate mechanisms of retention and to evaluate effects of sorption on biological activity.

Degradation of a pesticide may lead to dissipation, alteration or enhancement of its biological activity. Precise knowledge of the nature and properties of degradation products and factors conducive to their formation were evaluated. Studies indicate that significant qualitative changes in composition of the microflora may result from specific effects of pesticides on specialized groups of organisms.

A significant aspect of this research was associated with evaluating pesticides as contaminants in the aquatic environment. These studies involved the evaluation of fresh water clams as indicators of pesticide pollution, a quantification of the contribution of pesticides to the aquatic environment by urban and suburban communities and the effect of waste treatment systems on removal and/or degradation of pesticides. Related studies were associated with metabolism and physiological response of organisms to various pesticide exposures.

The relationship of the structure, sorption activity and role of the waxes associated with cuticular membrane to pesticide uptake and metabolism was studied. Further studies involved the effect of diphenid on plant growth and metabolism and the very significant discovery of the relationship of simazine on protein synthesis.

5.0568, SPORULATION AND GERMINATION OF CLOSTRIDIUM BOTULINUM

R.V. LECHOWICH, Michigan State University, School of Agriculture, East Lansing, Michigan 48824

Conditions required to obtain adequate growth and sporulation of Type E Clostridium botulinum will be further evaluated. Germination studies of spores produced under different conditions will also be continued. Toxin production in complex and defined media will be studied and the nature of the toxin produced by different strains of the same toxin type will be examined. Gas-liquid chromatography pyrolysis (GLCP) techniques will be used to determine the applicability of this method of analysis to distinguish metabolic by-products and the use of GLCP as a means to rapidly identify a specific toxin type of Cl. botulinum. Data gained by GLCP techniques and other data on spore composition should be correlated with other properties of Cl. botulinum spores.

5.0570, AN EVALUATION OF WIDELY USED HERBICIDES ON AQUATIC PLANTS, FISH AND FISH-FOOD ORGANISMS

E.W. ROELOFS, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

(1) To assess the influence of total alkalinity, pH and temperature of the water on the effectiveness of several widely used herbicides. (2) To test the effect of weed control by chemical means on fish-food organisms. (3) To evaluate fertilization as a method of controlling higher aquatic plants.

Preliminary work in the laboratory will include study of influence of water quality on effectiveness of various herbicides. Toxicity of herbicides to fish will be studied in conjunction with the laboratory experiments. While some fertilization studies can be done in the laboratory, the major effort here will be in farm ponds and small lakes. The effect of weed control by chemical means on fish-food organisms will be studied by direct determination of organism abundance before and after control, and by study of stomach contents of fish.

5.0571, OCCURENCE OF PROSTHECATE BACTERIA IN A GRADIENT-POLLUTED RIVER

J.T. STALEY, Michigan State University, School of Veterinary Medicine, East Lansing, Michigan 48824

Freshwater contains a group of bacteria which are morphologically distinguishable from other bacteria with the phase contrast microscope. These unusual bacteria have one or a number of appendages extending from the surface of the cell. On the basis of the number, shape, and arrangement of the 'prosthecae' (or appendages) they are assigned to a genus. Poin-dexter (1964) has described Caulobacter and Asticcacaulis; An-calomicrobium and Prosthecomicrobium, two additional fresh-water forms, have also been isolated and described (Staley, 1967). Little is known of their importance and their numbers in

freshwater. There is some indication that they may be significant in the ecology of freshwater.

Consequently, the objective of the proposed research is to determine the concentration of these bacteria along a river course in which the degree of pollution increases from source to outlet, and to correlate these numbers with the total and viable counts of other bacteria (including E. coli, a sewage pollutant).

5.0572, THE RELATIONSHIP OF SEWAGE HANDLING PRACTICE TO PESTICIDE RESIDUE LEVELS AND INVERTEBRATE ECOLOGY

M. ZABIK, Michigan State University, Graduate School, East Lansing, Michigan 48824

The object of the proposed work is to determine wheather a buildup of insecticide residue will occur in the silt below the new East Lansing waste treatment plant and if so, how far downstream it will extend. It is also hoped to determine the source of the residue, i.e. is it coming from the plant effluent, or does it come from points upstream due to drift and then collect below the plant due to the higher organic content of the effluent. An additional segment of the proposed work is to study its interrelationships among the nutrient source (chemical phase), pesticide residue levels, and invertebrate ecology.

5.0573, EFFECTS OF VARIOUS FOREST TYPES AND STAND TREATMENTS ON GROUNDWATER RECHARGE AND STREAMBANK EROSION IN AREAS OF DEEP GLACIAL DRIFT

D.H. URIE, U.S. Dept. of Agriculture, East Lansing, Michigan

Object: To develop forest management practices to improve water yield by inducing greater recharge of ground water. To develop mechanical and vegetative techniques for stabilizing eroding streambanks, channel bottoms, and adjoining lands.

Plan of work: The project staff is determining the water balance under existing vegetation in areas of glacial drift and sand plains. They are studying streambank erosion to determine its causes and methods of erosion controls by mechanical and vegetative means. The changes in suspended sediment following stabilization are being evaluated. New studies will determine effects of forest management practices on snow accumulation and ground-water yields.

SUPPORTED BY U.S. Dept. of Agriculture

5.0574, DISSOLVED ORGANIC MATTER AND PHOTOSYNTHESIS IN LAKES

R.G. WETZEL, Michigan State University, W.K. Kellogg G. Lk. Biol. Sta., Hickory Corners, Michigan 49060 (AT(11-1))

Studies are in progress on the qualitative and quantitative analyses of excretion and utilization of dissolved organic compounds and their role in the nutrition and metabolism of planktonic and sessile producers. Discrimination between bacterial, algal, and macrophytic utilization of organic compounds directly in chemo-organotrophy or indirectly by the complexing of inorganic ions affecting metabolism is being approached experimentally. Both axenic and natural populations are used in distinguishing the significance of the individual mechanisms by which dissolved organic compounds influence photosynthesis at naturally occurring concentrations.

A second area of investigation is centered on the qualitative and quantitative excretion of dissolved organic matter by submerged macrophytes and the relation of such compounds to inorganic nutrition and rates of metabolism. Variations in the composition of extracellular compounds and rates of excretion are being determined with regard to changes in metabolism and a number of environmental parameters. While much of the work is being performed with axenic cultrues of macrophytes, experimentation will be extended to in situ analyses under natural conditions. Detailed cyclic variations of physical, chemical, and biolog-

5.0575, TRANSPORT, STORAGE, AND TOXICITY OF INSECTICIDES IN AQUATIC ENVIRONMENTS

J.W. MERNA, State Dept. of Conserv., Lansing, Michigan 48296

Project and Job Objectives: To learn the pathways and measure the rates of concentration and degradation of insecticides in a pond system, and to evaluate the toxic effects of the insecticides on organisms in the system.

Procedures: In an initial step, DDT was applied to a small natural pond; a second pond served as a control. The study of pathways and degradation was complicated by a varied fauna and rapid degradation of DDT to DDE and DDD. Thus the study was extended and simplified, in a physical set-up with four vinyl-plastic tanks, 10 feet in diameter x 4 feet deep, submerged in a farm pond to insure temperature uniformity. The food chain was simplified to algae, microcrustaceans and brook sticklebacks (*Eucalia inconstans*). The 4 ponds will provide this experimental set-up:

Pond 1. Filtered pond water, clean sand bottom. No DDT added. Periphyton measured, using 104 sheets (10' x 3'), hung one foot below surface. Pond with microcrustaceans and sticklebacks.

Pond 2. Same as 1, but treated with 15 ppb DDT (para para).

Pond 3. Same as 2, but without sticklebacks.

Pond 4. Same as 2, but with *Artemia*, and without microcrustaceans.

Thirty days after DDT is added to 2, 3, and 4, fin-clipped sticklebacks to be introduced into 1, 2, and 4, and periphyton sheets will be placed in each pond. Experiments will run 30 days; samples will be frozen for later analysis of DDT. The experiment will provide three food chains for study of DDT transmission.

5.0576, LAKE MICHIGAN CHEMICAL CONTROL OF SEA LAMPREY

W.E. GAYLORD, U.S. Dept. of Interior, Biological Station, Lundington, Michigan

The Bureau of Commercial Fisheries, under the direction of the Great Lakes Fishery Commission, is using selective larvicides as an experimental method of control for sea lampreys in Lake Michigan. The study is designed to eliminate all generations present in the streams tributary to the lake by treatment of these streams with chemical, and to determine if such action will control effectively the parasitism on lake trout and other fish.

The control method requires a thorough knowledge of: the presence and distribution of ammocete populations in tributaries; physical characteristics and flow data of infected streams; accurate bioassays and chemical analyses of the water; precise metering of the chemicals; and posttreatment surveys to measure and analyze the effectiveness of individual treatments.

A total of 99 Lake Michigan streams contain sea lampreys. All streams were treated by July 1966. Treatments since then have been repeated at approximately 4-year intervals or at intervals determined from observations on the rate of reestablishment and growth of sea lampreys.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0577, LAKE SUPERIOR CHEMICAL CONTROL OF SEA LAMPREY

R.A. BRAEM, U.S. Dept. of Interior, Biological Station, Marquette, Michigan

The Bureau of Commercial Fisheries, under the direction of the Great Lakes Fishery Commission, is using selective larvicides as an experimental method of control for sea lampreys in Lake Superior. The study is designed to eliminate all generations present in the streams tributary to the lake by treatment of these streams with chemical, and to determine if such action will control effectively the parasitism on lake trout and other fish.

The control method requires a thorough knowledge of: the presence and distribution of ammocete populations in tributaries; physical characteristics and flow data of infected streams; accurate bioassays and chemical analyses of the water; precise metering of the chemicals; and posttreatment surveys to measure and analyze the effectiveness of individual treatments.

There are 75 streams tributary to the U.S. shore of Lake Superior containing sea lampreys. The initial treatment of these streams was completed in 1961. The second application was finished in 1964. Since then treatments have been repeated at intervals determined from observations on the rate of reestablishment and growth of sea lamprey ammocetes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0578, LAKE HURON CHEMICAL CONTROL

B.R. SMITH, U.S. Dept. of Interior, Biological Station, Marquette, Michigan

The Bureau of Commercial Fisheries, under the direction of the Great Lakes Fishery Commission, is using selective larvicides as an experimental method of control for sea lampreys in Lake Huron. The study is designed to eliminate all generations present in the streams tributary to the lake by treatment of these streams with chemical, and to determine if such action will control effectively the parasitism on lake trout and other fish.

The control method requires a thorough knowledge of: the presence and distribution of ammocete populations in tributaries; physical characteristics and flow data of infected streams; accurate bioassays and chemical analyses of the water; precise metering of the chemicals; and posttreatment surveys to measure and analyze the effectiveness of individual treatment.

There are 48 tributaries along the U. S. shore of Lake Huron known to contain sea lampreys. Three of these were treated in 1962. Treatments in this area were resumed in 1966 and 18 streams were treated.

5.0579, DEMONSTRATION AND EVALUATION OF POLYMERIC ADDITIVES IN THE TREATMENT OF STORM SEWER OVERFLOW

R.F. WUKASCH, Dow Chemical Company, Midland, Michigan

This project describes a two year study of the use of chemicals to control water pollution resulting from combined sewer overflows including the following areas of study.

1. Develop information pertaining to the Milk River Pumping Station, Crosse Pointe, Mich. and the corresponding Drainage Basin.
2. Flocculant studies will be carried out on both laboratory scale and full scale to demonstrate improvement in treatment efficiency with the use of polymeric flocculants.
3. Disinfection study. A demonstration will be made of the effectiveness of the disinfectants, with and without polymers. Work will be done on both a pilot plant and laboratory scale.
4. Model studies. A model will be made of the existing basin, and tested concurrently with the full scale basin to validate its use for model extrapolation. An optimized model will be conceived, built, and tested as a design for sedimentation incorporating chemical flocculation.
5. Conclusion. A concluding phase of the project will consist of economic analysis, restoration of the site to its original condition, and the preparation and distribution of the final report.

5.0580, BIOASSAY

J.H. HOWELL, U.S. Dept. of Interior, Hammond Bay Biolog. Sta., Millersburg, Michigan

Research is directed toward the discovery of chemicals which, when a stream environment, will be selectively toxic to larval sea lamprey (*Petromyzon marinus*). The procedure consists of bioassaying a wide variety of organic compounds, representing most of the basic structural classes, under standard conditions against larval sea lamprey and rainbow trout (*Salmo gairdnerii*). The discovery of a chemical possessing the desired biological activity (toxicity and selectivity for larval lamprey) results in the testing of structurally related compounds. The relation between molecular structure and biological activity are studied and com-

5. WATER QUALITY MANAGEMENT AND PROTECTION

pounds custom synthesized to produce the best possible biological activity. Chemicals selected for field use are tested to determine what effect environmental factors such as water chemistry, temperature, turbidity and light have on their biological activity. Tests are run on promising compounds to determine their toxicity to a variety of game and nongame fish species as well as aquatic invertebrates. Methods are devised for preparing concentrated stock solutions of compounds being considered for field use. Analysis techniques, which are fast and accurate are developed. A chemical's potential as a sea lamprey control agent is evaluated under simulated stream conditions and in carefully controlled experimental stream treatments.

5.0581, A COMBINED SEWERAGE COLLECTION AND TREATMENT FACILITY

H.E. MCENTEE, Mount Clemens Government, *Mount Clemens, Michigan*

The existence of combined sewers may be an asset instead of a liability. Recognizing that the separation of sewers may be an intolerable economic burden and may not accomplish the goal of alleviating pollution in outlet streams, it is proposed to collect all of the run-off from the projected area. While the rate of run-off is usually a problem, the total accumulation of rainfall during any storm is not usually immense. By minor storage in streets the total flow can be collected at the treatment site.

The treatment facility will be developed in a City Park concept with the treated collected combined sewage forming two lakelets which are expected to be used for boating, fishing, and providing an aesthetic setting for picnicking. The original collection reservoir (Lake A) will be hidden from public view. Water from Lake A can then be pumped at a slow rate (between storms) through a micro-strainer and chlorine contact chamber before discharge into Lake B and thence to Lake C.

Before discharge into the outlet River it will be additionally filtered for algae removal by means of microstrainers and sand filters. The lakes will be oxygenated as necessary by spray fountains and other aerators.

5.0583, NUTRIENT CONTROL PROJECT - DETROIT LAKES, MINNESOTA

W.C. LARSON, Detroit Lakes Engin. Dept., *Detroit Lakes, Minnesota*

Disposal of nutrients from municipal, private, domestic, and agricultural wastes in the Detroit Lakes, Minnesota area poses a serious problem owing to the high groundwater table, very permeable gravel aquifer, and wide interception routes of groundwater underflow. Several lakes in the chain of lakes in this area are very important to the recreational needs of the community and valuable to the tourist industry, have experienced catastrophic aquatic weed and algal growths in recent years as a result of nutrient enrichment. These lakes are interconnected by the Pelican River or its tributaries and are situated down gradient (to the southwest of Detroit Lakes, Minnesota. Since sources of nutrients are widely

scattered, it would not be economically feasible to intercept all waste outfalls with a central distribution system and provide subsequent treatment. It is proposed that nutrients in this sewage disposal system be intercepted or diminished in two different ways: 1) by dispersing the effluent from secondary treatment facilities on peat land and 2) by harvesting aquatic vegetation which contains nutrients. It is intended that by manipulation of natural environmental processes the rate of eutrophication will be arrested at minimal expense.

5.0584, CHRONIC EFFECTS OF HEAVY METALS ON FISH

R.W. ANDREW, U.S. Dept. of Interior, Natl. Water Quality Lab., *Duluth, Minnesota*

The overall objective of this work is to develop analytical and toxicological techniques for relating the chronic effects of heavy metals and heavy metal wastes to observable short-term metabolic and physiological effects. The acute, subacute, and chronic effects of Cr, Cu, Cd, and Zn will be studied with Brook Trout, Yellow Perch, and for Bluegills as possible test species. Emphasis will be placed on the effects of the metals on the respiratory and reproductive systems, growth rates, and overall production efficiency of the fish. Tracer and radiotracer techniques will be used to determine modes of metabolism (intake/disposition/excretion) and physiological effects of one or more of the metals. Ultimately, attempts will be made to correlate the chronic physiological and toxicological effects with measurable short-term (acute) effects.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0585, THE INVESTIGATION AND ANALYSIS OF BIOCHEMICAL PROCESSES OF AQUATIC ORGANISMS UNDER STRESS

G.M. CHRISTENSEN, U.S. Dept. of Interior, Natl. Water Quality Lab., *Duluth, Minnesota*

The objective of this work is to carry out investigations on a molecular level on organisms, organs, tissues, cells and chemicals of aquatic life which have been exposed to toxicological or noxious situations and stress; to establish base-line data, or normal values, for specific biochemicals or biochemical systems in organisms and also, later, to establish parallel experimental values for those systems when under toxicological or noxious situations and stress. It is proposed that work be done to investigate and clarify the interreaction between stress source and stressed system, diagnosis and prognosis. It is proposed that research be carried out in order to determine whether it is possible to carry out a qualitative and quantitative analysis on specific biochemicals in an organism and deduce the general state of health or well-being of that organism or diagnose its ill health and have a basis for making a prognosis regarding its future state or health condition.

Initially, work is being carried out with the general 'fight-or-flight' (stress) hormones, adrenaline and noradrenaline. We are in the process of establishing normal values for these two biochemicals in fish, and plan then to determine non-normal values for the organism when under toxicological or other types of stress. Equipment which is particularly useful for this study includes a recording spectrophotometer, thin-layer and paper chromatographic apparatus, a recording spectrophotofluorometer and a sensitive infra-red spectrophotometer.

Other biochemicals that may be investigated in the future include, tentatively, blood glucose, serum non-protein nitrogen, certain inorganic salts, specific serum enzymes, plasma fatty acids and other specific hormones that are known to be involved in stress-type biological reactions.

5.0586, CULTURING, PROPAGATION AND CONDITION EVALUATION OF FISHES

D.A. HILDEN, U.S. Dept. of Interior, Natl. Water Quality Lab., *Duluth, Minnesota*

Ten species of fish have been selected on the basis of economic importance and nationwide distribution, to be utilized

5. WATER QUALITY MANAGEMENT AND PROTECTION

in developing water quality criteria, for the protection of all forms of aquatic life. These fish species and the organisms in their respective food chains will be used to determine the effects of various types of water pollution on all forms of aquatic life. Acute, subacute, and chronic bioassay studies will be made.

This particular project will develop methods and techniques for culturing and natural spawning (propagation) of the selected wild fish species, in the laboratory environment. This must be done in order that chronic bioassay work can be carried out through at least one complete life cycle of the species.

Physiological parameters such as hematocrits, hemoglobins, total and fractional serum protein determinations, blood calcium to magnesium levels, blood phosphate levels, hormone levels, enzyme levels, as well as histological studies will be measured bi-monthly to determine the physiological well being and condition of the species before they are used for bioassay work--and to develop 'laboratory' normal parameter means, to which, the same physiological parameters from fishes subjected to experimental treatments, can be compared.

The initial work will be with yellow perch, *Perca flavescens*, brook trout, *Salvelinus fontinalis* and lake herring, *Coregonus artedii*.

5.0587, RECOVERY OF INDICATOR BACTERIA ON SELECTIVE MEDIA DURING DECREASE OF VIABLE COUNTS

A.W. HOADLEY, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

There is some evidence that selective procedures for the enumeration of indicator bacteria underestimate actual viable populations as counts decrease during 'die-away', resulting in an apparent rate of 'die-off' which is greater than the actual rate. It is the objective of this project to determine whether commonly accepted procedures yield meaningful results when applied during the so-called 'die-away' of indicator bacteria. Answers obtained should aid in interpretation of field data, in the development of better procedures, and in answering the broader question of what factors cause decreases in viable bacteria in water.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0588, RELATION OF SWIMMING WATER QUALITY TO THE OCCURRENCE OF EAR INFECTIONS

A.W. HOADLEY, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

Several studies have indicated a need to devote attention to the relationship of bathing water quality to ear, nose, throat, and skin infections among swimmers. There exists some evidence that pathogenic bacteria playing an important role in outer ear infections occur in some surface swimming waters. It is the objective of this project to determine whether the strains of pathogenic bacteria isolated from surface bathing waters are, in fact, identical to those strains isolated from infected ears.

5.0589, EFFECTS OF D.O., TEMPERATURE AND POTENTIAL TOXICANTS UPON SELECTED MACROINVERTEBRATES (EMPHASIZING NON-ARTHROPODS)

M.J. IMLAY, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

Effects of dissolved oxygen, temperature and toxicants (such as CuSO₄) on commercially valuable fresh-water clams and on fish food chain macroinvertebrates such as snails, leeches, scuds, insects, and flatworms will be studied.

Relation of cellular changes and daily activity patterns to toxicant or environmental stress and relation of mass filter-feeders (clams and sponges) to bacterial water quality will also be investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0590, EFFECTS OF TEMPERATURE ON MATURATION, EMBRYONIC DEVELOPMENT AND CONDITION OF FRY IN YELLOW PERCH - LAKE HERRING, SMELT AND WALLEYE

B.R. JONES, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

The project is to determine levels of temperature needed for sustained production of freshwater fish through study of effects on reproduction. Criteria thus to be determined are to serve as a basis for water quality standards.

Fish will be exposed to several levels of temperature related to seasonal temperature variations. Effects of elevated temperatures on gonad development to be determined in part by histological technique, on embryonic development and on condition of larvae will be measured in yellow perch. Effects of elevated temperatures on embryonic development and condition of larvae will be measured in lake herring, smelt and walleye.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0591, CULTURING AND PROPAGATION OF SELECTED INVERTEBRATES AND ASSOCIATED FOOD ORGANISMS

A.E. LEMKE, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

To maintain selected invertebrate forms from field collections at any specific stage without loss of strength of change from collected condition; and to continuously produce a crop of animals which are suitable for continuing the life cycle and/or to use in experiments for determining the water quality requirements for that species. A necessary adjunct will be the propagation of the desired food organism of the desired species.

Initial work will be concerned with culturing *Hydropschye betteni* and propagation of *Gammarus faciatu*s, *Daphnia magna*, *Cyclops* sp., *Bosmina* sp. from the invertebrate group, and *Rhizoclonium*, *Coccolcholorus*, and *Synedra* as plant representatives. Temperature, light, and flow will be controlled using continuous flow systems.

The initial phases of the work will be begun in fiscal 68 and finished in fiscal 69. Subsequently, work will be started with those organisms that can be reared to change their life cycle by manipulation of the listed factors.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0592, PHYSIOLOGIC AND METABOLIC RESPONSE AS INDICATORS OF STRESS

J.M. MCKIM, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

The objective of this research is to measure the subtle internal metabolic and physiologic responses of fish to environmental changes.

Initially this project will be involved with the effects of low dissolved oxygen levels on cardiac and respiratory functions in the yellow perch (*Perca flavescens*) and the brook trout (*Salvelinus fontinalis*). It has been shown by other investigators that these functions are altered considerably when an individual is subjected to low dissolved oxygen levels. These alterations in cardiac and respiratory function indicate a shift in metabolism due to hypoxic conditions. If the level of dissolved oxygen at which these changes occur is different for each species, then a method to aid in setting dissolved oxygen standards for fresh water fish might be initiated.

The fish will be held at a constant temperature in metabolism chambers through which flows water of varying oxygen concentrations.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0593, EFFECTS OF HIGH TEMPERATURE, LOW OXYGEN, AND PH EXTREMES ON THE SURVIVAL OF

5. WATER QUALITY MANAGEMENT AND PROTECTION

AQUATIC INSECTS AND CRUSTACEA IMPORTANT AS TROUT FOOD

A.V. NEBEKER, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

To establish dissolved oxygen, temperature, and pH requirements for various species of aquatic insects and crustacea which have been found to be important in the food chain of brook, rainbow, and lake trout. Two species of Lake Superior crustaceans, *Mysis relicta* and *Pontoporeia affinis*, and five species of aquatic insects, *Acroneuria lyctorias*, *Taeniopteryx maura*, *Brachycentrus americanus*, *Hydropsyche betteni*, and *Ephemerella subvaria*, will be used as test organisms. The work will consist of determining the TL_m(LD50) values for 96 hours and 30 days, and longer if possible, for high temperatures, low oxygen, and low and high pH.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0594, EUTROPHICATION - REMOVAL OF NUTRIENTS - SHAGAWA LAKE

L.P. SEYB, U.S. Dept. of Interior, Shagawa Lake Eutroph. Project, Ely, Minnesota 55731

The objective is to evaluate the removal of algal nutrients from municipal sewage in an advanced waste treatment pilot plant as a means to impede blue-green algal blooms. Nutrient removal will be accomplished by combinations of coagulation, filtration, ion exchange and carbon adsorption operations. Pilot plant effluent will be mixed with lake water in one 125,000 gallon pond immersed in the lake to determine the effect of nutrient removal on algal populations. A similar pond will receive trickling filter effluent mixed with lake water. A third pond will serve as a control. Similar tests will be made in 200 gallon and 5 liter containers to determine scale effect. Water quality of Shagawa Lake, its inflow, and outflow streams will be determined regularly to establish base-line information.

If nutrient removal by the pilot plant is effective, a full scale tertiary sewage treatment plant for the removal of algal nutrients from Ely's sewage will be considered as a demonstration. Because bottom sediment might be a reservoir for algal nutrients, studies to determine the effect of sediment on the quality of lake water will be undertaken when experimental work in the pond ceases because of weather conditions.

Ultimately, enough facts about algal and aquatic plant growths in Shagawa Lake will be available to provide for a plan to reverse the lake from its eutrophic condition to one that is less or non-eutrophic.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0595, USE OF FUNGI IMPERFECTI IN WASTE CONTROL

B.D. CHURCH, North Star Res. & Dev. Inst., Minneapolis, Minnesota

The objective of this project is to select and develop rapidly growing fungi strains that will utilize dissolved and suspended organic matter in waste streams from the food processing industry to produce a mycelium readily removed from the streams by filtration and also to develop practical processes for the utilization of such fungi in selected waste streams from the food processing industry. Initial studies will be on waste streams from soybean and sweet corn processes.

5.0597, MATHEMATICAL MODEL OF STORM AND SANITARY INTERCEPTOR SYSTEM

C.E. BOWERS, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

The objective of this study is the development of a mathematical model of the interceptor system of the Sanitary District, to assist in the operation of diversion structures in the trunk sewer system. The model will take precipitation data at 8 locations around the area as input and compute runoff in the trunk system, inflow to the interceptors and route the flow through the interceptors. It should provide the operation with information on peak flows and depths, to assist in operation of the diversion structures. The study started in the winter of 1967 and will take about one year to complete.

5.0598, NITRIFICATION AND DENITRIFICATION OF WASTE WATER

W.K. JOHNSON, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

The objective of this project is to conduct small-scale continuous flow pilot plant investigations to investigate nitrification in the activated sludge process and denitrification for the purpose of removing nitrogen from wastewaters. Several flow patterns will be investigated including a staged operation with nitrification and denitrification used alternately. A synthetic milk waste will be used as the raw waste feed to the pilot plants. No results of the investigations are available at this time. It is planned that larger scale demonstration plant tests using domestic sewage will also be conducted during the coming year.

5.0600, A STUDY OF THE OPEN WATER DISTRIBUTION AND ABUNDANCE OF NET-PLANKTON AS AN INDEX OF EUTROPHICATION IN LAKE SUPERIOR

T.A. OLSON, Univ. of Minnesota, School of Public Health, Minneapolis, Minnesota 55455

This research is aimed at applying the Continuous Plankton Recorder Techniques of Hardy to non-oceanic situation, namely Lake Superior. Hardy recorders were designed for marine work and can be towed behind merchant vessels and other commercial craft proceeding at their normal cruising speeds. During these tows, a band of silk bolting cloth is automatically fed across a tunnel-opening to collect organisms from the water. Under highly efficient filtering conditions, three cubic meters or 3000 liters of water are strained over each ten-mile section of the course and organisms in the catch are deposited in a chronological order on the moving band. After exposure the band is covered by another layer of silk to hold the organisms in place and the two bands are then tightly rolled up in a small tank of formalin preservative. At the end of each 500-mile run the roll is removed from its chamber and shipped to the laboratory where a count is made of the organisms. The zooplankters (herbivores) which make up the second

5. WATER QUALITY MANAGEMENT AND PROTECTION

trophic level of the ecological pyramid can be accepted as a reflection of the primary production and therefore as an expression of the state of fertility or quality of the water being studied.

Because such large areas can be covered and each mile traversed can be associated with a definite point on the bolting cloth band one can detect variations which occur over the entire lake and can readily locate such areas of variance accurately on a geographical basis. The method is envisioned as a practical parameter of water quality which will be of distinct value in studies of any of the Great Lakes.

University of Minnesota

5.0601, BENTHONIC INVERTEBRATES AS AN INDEX OF WATER QUALITY

T.A. OLSON, Univ. of Minnesota, School of Public Health, Minneapolis, Minnesota 55455

The proposed water pollution study will be made on immature aquatic invertebrates. Primary efforts will continue to be concentrated on the oxygen requirements of each species during its aquatic life cycle. It is believed that through such a study a more exact evaluation can be established on the status of these invertebrates as indicators of water quality or as potential bioassay indicators. A subsequent cataloging of each species should be of value to agencies and persons concerned with water pollution.

Since environmental conditions can be more closely controlled in the laboratory, the work will be centered on this aspect. A limited number of field studies will be included. A flow-through respirometer in which the oxygen is measured by an electrochemical transducer and the conventional Manometric technique will be employed to measure oxygen consumption rates.

5.0604, THE ROLE OF MIXING IN MAINTAINING STRATIFIED FLOW

E. SILBERMAN, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

In controlling pollution of lakes, streams, and beaches, it is desirable to be able to predict the relative importance of stratification and mixing between an effluent and ambient water when there is a difference in density between the two. Density differences may arise, for example, when warm water is discharged into cooler water, when aerated sewage is discharged into normal

river water, when fresh water wastes are discharged into salt water, and when sediment-laden water is discharged into clear water. Two somewhat different physical situations are involved; these are the outfall area where effluent and ambient fluid first meet and the area distant from the outfall where persistence of stratification requires study. A broad analytical and experimental study of the problems involved is proposed. The objectives are to improve the ability of the engineer to: (1) determine the degree of stratification that may be expected under given outfall conditions, (2) control stratification and mixing at an outfall, (3) determine the persistence of stratification at a distance from an outfall, (4) determine the effect of wind waves on stratification and mixing, and (5) make model studies of stratification and mixing problems.

5.0606, DEVELOPMENT OF A MATHEMATICAL MODEL TO PREDICT THE ROLE OF SURFACE RUNOFF AND GROUND WATER FLOW IN OVERFERTILIZATION OF SURFACE WATERS

C.P. STRAUB, Univ. of Minnesota, School of Public Health, Minneapolis, Minnesota 55455

Better control of agricultural and natural pollution is required to protect Minnesota intrastate and interstate surface waters. Since nutrient enrichment information is inadequate, studies are planned to develop a mathematical model to predict the role of surface runoff and groundwater flow in the overfertilization of surface waters. Following development of the model, which will include theoretical expressions required for a complete hydrologic budget and general expressions relating to nutrient balance, criteria will be developed for controlling sources contributing to the overfertilization or eutrophication of Minnesota waters. The research effort will identify the primary factors introducing nitrogen and phosphorus to the aquatic environment, will delineate areas where additional data are needed and will evaluate the resultant model under field conditions. The model will assist state and federal agencies in initiating surface water fertilization control programs.

5.0614, EFFECT OF PAPER FIBER WASTES ON FISH EGGS AND JUVENILES

L.L. SMITH, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

Suspended wood fiber is to be tested for its effects on fish eggs, fry and fingerlings. Effects of wood fiber mats in Rainy River on fish and invertebrates will be tested. Decomposition products of wood fiber mats will be tested in laboratory. Effect of *Sphaerotilus natans* on fish eggs and fry is to be tested. Deleterious effects of low oxygen levels in connection with fiber decomposition products will be determined.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0615, INFLUENCE OF WATER POLLUTANTS AND WATER QUALITY ON EARLY LIFE HISTORY AND POPULATION DYNAMICS OF MINNESOTA FISHES

L.L. SMITH, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

The objective of this study is to determine the influence on fish production of various water pollutants of industrial and domestic origin; specifically, what such materials as H₂S, detergents, paper mill wastes and similar materials have on growth rate, fecundity, and survival of fish. Fish food organisms are also included in investigations.

Field observations in polluted areas are made to determine limits of major parameters such as temperature, O₂, pollutant levels and fish survival. Laboratory bioassays, long-term tests at sublethal levels of various materials, and fecundity tests will be made in the laboratory under controlled conditions to separate out effects of various factors and to define subtle long-term effects of pollutants that will influence level of annual harvestable crop of fish.

SUPPORTED BY Minnesota State Government

5.0616, IRON ORE FLOTATION

N.B. MELCHER, U.S. Dept. of Interior, Twin Cities Met. Res. Ctr., Saint Paul - Twin City Airport, Minnesota 55111

Conduct bench scale and pilot plant research on fine grained nonmagnetic taconite, both independently and in cooperation with major iron mining companies, to devise and advance applicable flotation technology. Investigations will be conducted to determine the role of frothers and certain select dispersants in introducing certain undesirable side-effects on flotation, to achieve further efficiency in the selective flocculation-desliming steps, and to improve grinding practice so as to minimize steel consumption.

Research will be continued to construct a basis for process control based on measurements of unadsorbed calcium ion and starch in flotation pulps undergoing anionic flotation of silica.

Additional effort will be directed to studies on: (1) Flotation systems employing cationic collectors. (2) Filtration of finely ground concentrate with the objective of increasing capacity and lowering moisture content of filter cake, and (3) Clarification of slime overflows to enable water reuse and to prevent stream pollution, preferably while maintaining solution alkalinity.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

5.0617, DETERMINING CHANGES IN PHYTOPLANKTON POPULATIONS IN CLOUDS OF FLUORESCENT DYE MOVING IN THE MISSISSIPPI RIVER

C.D. MCNABB, Saint Marys College, Graduate School, Winona, Minnesota 55987

The degree of integrity maintained by clouds of fluorescent dye as they move through the 14 mile stretch of the Mississippi River pool 06 near Winona, Minnesota will be studied using continuous discharge and point discharge of Rhodamine B that will be detected downstream on surveyed transects with a boat mounted, continuous flow Turner Model 11 fluorometer. Time-in-travel and dispersal patterns between consecutive transects will be studied in different seasons. Plankton will be sampled within clouds of dye as they move between transects so that quantitative changes in the population of the diatom *Stephanodiscus hantzschii* caused by such things as immigration and emigration from the flow of the main channel might be determined. This work will be centered at the Hydrobiology Station of St. Mary's College located at Homer, Minnesota.

5.0618, MAYFLY DISTRIBUTION AS A WATER QUALITY INDEX

C.R. FREMLING, Winona State College, Graduate School, Winona, Minnesota 55987

Hordes of mayflies rise from the Mississippi River every summer and create nuisance problems for river residents and river traffic. The relative abundance of the various species in a given area, however, is probably a reliable indicator of general water quality in that area.

Adult mayflies will be collected systematically along the Upper Mississippi River. An efficient, reliable, large-scale collection system was initiated in 1957 and it has been in continuous operation since that date. Past and future collections will be analyzed to determine (1) geographical distribution of the various species, (2) times of adult emergence, (3) areas of scarcity and abundance, (4) population trends, and other basic biological data. Most important, this analysis will determine the present state of the river as habitat for pollution-sensitive organisms. These data will provide a basis for comparison, should the quality of the aquatic habitat change in the future.

I have developed methods for rearing large numbers of burrowing mayflies in the laboratory. Laboratory populations will be maintained to determine the effects of limiting factors such as concentrations of dissolved substances, food supply, temperature, intraspecific strife and interspecific competition. The degree to which burrowing mayflies contribute to total turbidity will be determined. Laboratory populations will also be studied to learn more concerning the environmental factors which coordinate mass rhythmic emergences of mayflies.

Laboratory experiments in conjunction with field investigations will enable me to evaluate the importance of the various roles played by mayflies in the aquatic ecosystem. This evaluation becomes increasingly important as river cities contemplate mayfly control programs.

5.0619, A STUDY OF COLIFORM BACTERIA AND ESCHERICHIA COLI ON POLLUTED AND UNPOLLUTED OYSTER BOTTOMS OF MISSISSIPPI

G. GUNTER, State Marine Conserv. Comm., Biloxi, Mississippi

Objectives: 1) To establish a regular sampling program on transects across Mississippi Sound and extending from fresh water to the Gulf of Mexico and on selected polluted and unpolluted oyster reefs. 2) To perfect technique for collecting comparable samples. 3) To complete bacterial analyses of collected samples. 4) To compare the bacterial flora from polluted and unpolluted areas of Mississippi Sound and adjacent waters, especially as it relates to sewage polluted oyster beds.

Procedures: 1) Field - (a) Surface, mid-water and bottom samples will be collected at established stations where there is sufficient depth of water. Additional samples will be collected as necessary. (b) Techniques to insure the collection of samples under sterile conditions will be established. (c) Temperature and salinity will be determined at all stations. (d) Collected samples will be refrigerated and returned to the laboratory for analysis. 2) Laboratory - (a) The Most Probable Number of coliform organisms and of *Escherichia coli* of presumptive human fecal origin will be determined by competent bacteriologists. (b) Additional studies will be carried out where feasible.

5.0620, NUTRIENT ASSIMILATION RATES - FIELD STUDIES

W. ABBOTT, Gulf Coast Research Laboratory, Ocean Springs, Mississippi

A series of estuarine ponds have been formed by capturing a bayou channel between levees. The ponds are utilized for factorial experimentation on effects of various nutrients in multiple dose combinations.

Phosphorus studies have shown that the ultimate fate of an added tracer spike is conditioned by the recent fertilization history of the pond. Ability of the whole pond ecosystem to function as a sort of 'phosphorus buffer' is indicated by the results.

Repetition of phosphorus studies and studies on the nitrogen cycle are planned for the near future.

5.0621, STUDIES ON INORGANIC NUTRIENT ASSIMILATION RATES IN ESTUARINE PONDS

W. ABBOTT, Gulf Coast Research Laboratory, *Ocean Springs, Mississippi*

The captioned research grant has provided funds for construction of 18 estuarine ponds. These ponds are being utilized for field scale testing of hypotheses developed during a series of microcosm studies (Abbott, J. Water Poll. Control Fed., 38:258-270 (1966); 39: 113-122 (1967)).

Studies are oriented toward evaluation of phosphorus and nitrogen turnover rates, kinetics of uptake of these elements, and validity of their roles as limiting nutrients in hyperfertilized estuarine situations.

SUPPORTED BY Rockefeller Foundation

5.0622, DEVELOPMENT OF STRUCTURAL MEASURES FOR SEDIMENT CONTROL AND FOR STREAM CHANNEL STABILIZATION IN THE SOUTHERN BRANCH

D.A. PARSONS, U.S. Dept. of Agriculture, *Oxford, Mississippi*

Object: To develop criteria for water training, grade control, and sediment deposition and/or removal structures to protect bed and banks and to maintain water conveyance capacity of natural and constructed channels of agricultural watersheds.

Plan of Work: Field locations are selected where stabilization measures are already in place and where these measures are to be installed. In the existing stabilized areas data are collected and compiled to establish reasons for success or failure. Where such measures are to be installed, data are acquired on the channel hydraulic conditions and geometry, and effectiveness periodically checked. Information is obtained on boundary velocity and shear stress reductions with various spacings, angles, densities, and alignments of the protective measures. Other measures are placed to withstand direct forces of flowing water.

SUPPORTED BY U.S. Dept. of Agriculture

5.0623, THE DECOMPOSITION OF PETROLEUM PRODUCTS IN OUR NATURAL WATERS

L.R. BROWN, Mississippi St. University, Graduate School, *State College, Mississippi 39762*

The anaerobic decomposition of crude and refined petroleum products in marine, brackish, and/or aquatic environments may be highly detrimental to the biological life of the area. Such occurrences can arise from the treatment of soil 'slicks' with precipitants or the discharge of hydrocarbons adsorbed onto particulate matter.

The specific aims of the present proposal are (1) to investigate the anaerobic decomposition of crude and refined petroleum products in terms of hydrocarbon removal and the production of water-soluble organic materials, (2) to generate sufficient data to be able to project what changes can be expected in a given water depending upon the volume of product being decomposed, (3) to determine if the process can be expedited by the addition of some essential nutrients such as phosphate and nitrate, and (4) to determine whether the addition of other compounds to neutralize the products resulting from the anaerobic decomposition of hydrocarbons might be of value.

5.0624, PESTICIDE RESISTANT FISH IN NATURAL ECOSYSTEMS

D.E. FERGUSON, Mississippi St. University, Graduate School, *State College, Mississippi 39762*

The applicant and his students first reported pesticide resistance in natural populations of fish in 1963. Since that time, our studies have concerned the extent and nature of resistance in vertebrates, and little effort has been directed to an assessment of the significance and potential of resistance to natural ecosystems.

Recent findings indicate that the ecological impact of resistant populations of fish may be so great and macabre as to stagger the imagination. For example, large numbers of highly resistant mosquitofish are able to survive as 10-day exposure to 2000 ppb endrin. If a medium-sized predaceous fish eats just one of these survivors, death ensues in about 6 hours. We suspect that the same would be true of an egret, snake, turtle or any other predator. What about man?

In a paper now in press, we show that a single resistant fish exposed to 1000 ppb endrin will release sufficient toxicant into 10 liters of tapwater to kill 5 susceptible fish in 38.5 hours.

How much pesticide are resistant fish able to tolerate? How much do they actually contain in heavily contaminated areas? What predators eat them? What is the consequence? Are humans eating them? These are some questions we hope to answer, and it is a matter of urgency that they be answered quickly! Our objectives are to attempt to assess the actual and potential significance of the presence of resistant fishes in natural ecosystems.

5.0625, WATER TEMPERATURE EFFECTS ON BED FORMS

J.J. FRANCO, U.S. Army, Waterways Experiment Sta., *Vicksburg, Mississippi*

The purpose of the investigation is to determine the effects of changes in water temperatures on sediment transport, streambed forms, and bed roughness of various types of bed materials found in natural rivers and materials used in movable-bed models. Tests will be conducted with fine, medium, and coarse sand and crushed coal at different water temperatures, ranging from a winter minimum of 40 degrees F to a summer maximum of 80 degrees F and three rates of introduction of bed material for each temperature. Each test will be run to the point of stability where input and extrusion of sand are equal. The overall program can be divided into testing of fine sand, testing of crushed coal, testing of medium sand, and testing of coarse sand.

SUPPORTED BY U.S. Dept. of Defense - Army

5.0626, NEUTRALIZATION OF ACID STRIP-MINE LAKES

J.R. WHITLEY, State Div. of Fisheries, *Columbia, Missouri*

Objectives: To determine the feasibility of converting acid strip-mine lakes to fish producing lakes by rapid neutralization with calcium hydroxide.

Procedures: A small acid lake will be treated with sufficient calcium hydroxide to raise the pH to 7.5. Agricultural ground limestone will be applied to the acid-producing portion of the watershed to neutralize additional sulphuric acid as it forms. Monthly measurements will be made of pH, acidity, alkalinity, specific conductance and turbidity. The lake will be stocked with fish immediately after neutralization.

The cost of treatment will be calculated to determine if this would be a practical method of raising the pH of acid strip-mine lakes to a level which will sustain a normal fish population.

Justification: The water in many coal strip pit lakes is too acid to support a normal aquatic fauna. Significant amounts of sulphuric acid may be formed when sulphur-bearing material on the bottom of the new strip pits is oxidized during the early stages of filling with water. The amount of acid formed during this early stage is often sufficient to acidify the entire body of water. Once the coal vein and associated sulfur containing formations are covered with water, much smaller amounts of acid are formed. If the spoil banks and other parts of the watershed do not contain acid-forming materials, the lake may be neutralized by calcium carbonate leached from the watershed. The time required for neutralization by this process varies greatly, depending on the initial amounts of acid formed and on the composition of the spoil banks. Several years often are required before a strip-mine lake is capable of supporting a significant amount of aquatic life.

Neutralization of moderately acid strip-mine lakes with calcium hydroxide should permit early use of these pits for fish production. Spreading agricultural lime over localized acid-producing areas in the spoil should assist in maintaining the lakes in an alkaline condition.

5.0627, BIOCHEMISTRY OF FISH SEMEN

D.D. CRUEA, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

The objective of the study is to evaluate the biochemistry of fish semen to detect effects of pesticides.

A biochemical screening of seminal plasma, sperm cells, and the tails of the sperm from cutthroat trout and other fishes will be performed to establish biochemical criteria useful as indices of fertilizing capacity. The study will cover presence of free amino acids, various cations, glycolyzable substrates, adenylic acids, and nucleic acids. Semen from fish exposed to endrin will be compared with that from untreated fish.

5.0628, COMPARATIVE UPTAKE OF 10 CHLORINATED HYDROCARBON PESTICIDES BY FISH

R.D. EARNEST, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

The purpose of this work is to compare uptake of 10 chlorinated hydrocarbon pesticides of fish. Fish are held in like concentrations of each pesticide and sampled as scheduled. Samples are measured for pesticide residue at Columbia.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0629, SERUM ANALYSIS OF CUTTHROAT TROUT EXPOSED CHRONICALLY TO METHOXYCHLOR PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTIONS

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

The serum of cutthroat trout will be studied during extended bath and feed treatments carried out at Jackson, Wyoming. The parameters to be measured are: Na, K, Ca, Mg, Cl, HCO₃ (equilibrated with 5% CO₂), NPN, urea, uric acid, creatinine, creatine, amino acids, cholesterol, total protein, and osmolality.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0630, THE CONSTITUENTS AND PHYSICO-CHEMICAL PROPERTIES OF SERUM FROM GOLD-FISH EXPOSED CHRONICALLY TO MALATHION AND ENDRIN

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

The serum of goldfish receiving different treatments with malathion or endrin will be studied in detail. These insecticides will be administered over a broad concentration range in their food over a period of several months. The fish will be held in flowing water (18 plus or minus 2 degree C) and fed daily on a balanced diet at the rate of 3% of the body weight per week in dry weight of food. The serum parameters to be estimated are Na, K, Ca, Mg, Cl, HCO₃, PO₄, NPN, urea, uric acid, creatinine, creatine, amino acids, glucose, cholesterol, phospholipids, total proteins, lipoprotein, glycoprotein, esterases, LDH isozymes, catechol amines, adrenocorticoids, sex steroids, pH, and osmolality.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0631, THYROID FUNCTION OF GOLDFISH AND RAINBOW TROUT EXPOSED CHRONICALLY TO MALATHION AND ENDRIN - PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTIONS

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

Thyroid activity will be studied in goldfish and rainbow trout receiving chronic exposures to malathion and endrin. Thyroid activity will be assessed by radioiodine uptake, radiothyroxine production (butanol extractable iodine), and mean thyroid cell heights. Serum iodine (I127) will be determined for collateral information on iodine metabolism. Hypophysectomized and intact fish receiving exogenous thyrotropin will be studied similarly to detect a possible mode of action of the pesticide.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0632, BLOOD OXYGEN AND CO₂ CARRYING CAPACITY OF 4 FISH EXPOSED TO MALATHION AND ENDRIN - PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTIONS

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

The influence of selected carbamates, organophosphates, and chlorinated hydrocarbon pesticides on the in vitro oxygen and carbon dioxide loading capacity of erythrocytes will be studied. Pilot studies will be carried out using carbaryl, malathion, and endrin on erythrocyte suspensions from carp, tilapia and rainbow trout. The conditions for optimal incubation will be determined for each species prior to treatment with these toxicants.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0633, EFFECTS OF MALATHION ON THE SEXUAL DEVELOPMENT OF MALE RAINBOW TROUT - PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTIONS

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

Hypophysectomized trout will be allowed to regress completely and then will be treated with gonadotropin to stimulate gonad development. The fish will be exposed to different levels of malathion during the gonadotropin treatment. The rate and extent of development will be studied. Observations on thyroid activity and serum composition will be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0634, EFFECTS OF ENDRIN & MALATHION ON GONADAL HYDRATION RESPONSE OF MALE GOLDFISH & RAINBOW TROUT. PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTION

F.B. GRANT, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

Prespawning, goldfish, and rainbow trout will be exposed to various levels of malathion and endrin prior to inducing the seminal thinning response in intact animals. The hydration response will be elicited by exogenous gonadotropin. The effects of these pesticides on this 24-hour hydration response will be studied.

The physico-chemical properties of the sperm cell carrier and urine will be studied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0635, LITERATURE SEARCH FOR POSSIBLE PESTICIDE DETOXIFYING AGENTS - CHEMICAL AND PHYSICAL STUDIES ON REDUCTION OF PESTICIDE HAZARDS

R.J. HESSELBERG, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

A literature search will be made in an effort to determine the known detoxifying agents which show some promise in reducing toxicity. At the same time, a search will be made for possible methods of screening chemicals for their detoxifying effect.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0636, SCREENING FOR PESTICIDE DETOXIFICATION AGENTS - CHEMICAL AND PHYSICAL STUDIES ON REDUCTION OF PESTICIDE HAZARDS

R.J. HESSELBERG, U.S. Dept. of Interior, Fish Pesticide Res. Lab.,
Columbia, Missouri 65201

Chemicals will be screened for possible detoxifying agents for DDT and aldrin/dieldrin. Laboratory chemical tests would be run on GLC and by bioassay methods. Chemicals which show promise will be further tested in some type of an expanded program.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0637, COMPARISON OF METHODS USED TO MEASURE ESTERASE ACTIVITY. INTERACTIONS BETWEEN PESTICIDE ON FISH ENZYME SYSTEMS

J.W. HOGAN, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

This work unit will attempt to correlate results of esterase activity measurements obtained by two colorimetric methods and by a manometric method. Brain tissue from three species of fish, cutthroat trout (*Salmo clarki* Richardson), bluegill sunfish (*Lepomis macrochirus* Rafinesque), and channel catfish (*Ictalurus punctatus* Walbaum) will be analyzed for acetylcholinesterase levels. The entire brain will be removed from the fish, homogenized in deionized water, divided into aliquots, and diluted with the appropriate buffer. At least triplicate samples of each homogenate will be analyzed by all methods. Also, effects of storage by freezing will be studied. In vitro inhibition will be determined. Samples of homogenate will be incubated with various anticholinesterase agents and the resultant decrease in acetylcholinesterase activity will be measured. Brains removed from fish which have been exposed to various anticholinesterase agents will be analyzed to correlate in vivo inhibition. All results will be analyzed statistically to determine if there are any significant differences.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0638, SEASONAL CHANGES IN ESTERASE ACTIVITY IN FISH AND INVERTEBRATES. INTERACTIONS BETWEEN PESTICIDES ON FISH ENZYME SYSTEMS

J.W. HOGAN, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Samples of adult bluegill and at least one species of aquatic invertebrate will be collected at monthly intervals and assayed for acetylcholinesterase activity. The initial study will continue for at least one year. If statistically significant changes in esterase activity are found to be correlated with sampling date the study will be extended for a second year and may be expanded to include additional species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0639, SCREENING AQUATIC INVERTEBRATES TO DETECT AN ORGANISM SUITABLE FOR USE IN A MONITORING PROGRAM

J.W. HOGAN, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Various aquatic invertebrates will be screened in an attempt to find one or more organisms which can be used to monitor for the presence of anticholinesterase agents. Ideally, such an organism should exhibit a reaction to levels of anticholinesterase agents which are not toxic to fish. Should such an organism be found, it could then be used to detect the presence of anticholinesterase agents before they can reach levels which are harmful to other members of the aquatic ecosystem. Initially, various invertebrates will be selected on the basis of availability and sensitivity to various anticholinesterase agents as indicated by bioassay test results. Dependent upon initial results, the enzyme system will be characterized in regard to optimum substrate, optimum substrate levels, both in vitro and in vivo reaction to various anticholinesterase agents, sex, date of sampling, etc. After a number of organisms have been screened, one or two of the more promising will be selected for use in an actual monitoring program in the field.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0640, CHARACTERIZATION AND COMPARISON OF ESTERASE(S) PRESENT IN THE HEADS OF THE IMMATURE FORM OF TWO SPECIES OF DAMSELFLY

J.W. HOGAN, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

To characterize and compare the esterases(s) present in the heads of the immature form of two species of damselfly (*Ishnura verticalis* Say and *Lestes congener* Hagen). Initial experiments

will be designed to determine a practical homogenization technique which will produce an active enzyme preparation. Enzyme characterization will proceed immediately after the optimal enzyme preparative technique is determined. The manometric assay procedure will be used. Characterization will include establishment of assay conditions such as optimum substrate and optimum substrate concentration. In addition, the effects of various selective inhibitors will be studied. In vitro inhibition of cholinesterase will be determined by incubating enzyme preparations with various concentrations of anticholinesterase agents.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0641, ROLE OF ENTERIC MICROORGANISMS IN DETOXIFICATION - INTERACTION BETWEEN MICROORGANISMS AND PESTICIDES

B.T. JOHNSON, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The purpose of this study is to investigate the role of enteric microorganisms endogenous to fresh-water fish in detoxification of insecticides.

Members of the microflora will be isolated in pure culture, identified, grown in enriched media and inoculated with various pesticides. Data will be gathered to ascertain the role these organisms play in the biodegradation and abolition of insecticide in fish.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0642, INFLUENCE OF PROTOZOAN ACTIVITY ON HALOGENATED HYDROCARBON RESIDUES - INTERACTION BETWEEN MICROORGANISMS AND PESTICIDES

B.T. JOHNSON, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Axenic cultures of a broad spectrum of free living fresh-water protozoans will be studied in vitro with selected insecticides.

The parameters of this investigation will be as follows: 1. Effects on protozoan population of the insecticide. 2. Ability of the organism to utilize the pesticide as a sole carbon source. 3. Role of protozoans in degradation of halogenated hydrocarbon pesticides. 4. Study possible use of protozoans as bio-indicators of low concentrations of pesticides.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0643, EFFECTS OF PESTICIDES ON PROTEIN, CARBOHYDRATE, AND NUCLEIC ACID METABOLISM. INTERACTION BETWEEN MICROORGANISMS AND PESTICIDES

B.T. JOHNSON, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Preliminary investigations will be initiated utilizing a selected group of yeast, bacteria and protozoa to ascertain the influence pesticides play in basic respiration and synthesis. Fundamental work will involve development of suitable radio-respirometry and disc electrophoresis technique.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0644, BIOTRANSFORMATION OF ALDRIN AND DIELDRIN BY BACTERIA - INTERACTION BETWEEN MICROORGANISMS AND PESTICIDES

B.T. JOHNSON, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Pure culture of bacterial species commonly inhabiting soil, water and fresh-water fish will be investigated to determine the role they perform in the metabolism of aldrin and dieldrin. Variables of pH, temperature, oxygen tension, etc., will be investigated. Analysis and identification of metabolites will be done utilizing gas chromatography, infrared spectroscopy, and C-14 tracers.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0645, BIOTRANSFORMATION OF HEPTACHLOR BY BACTERIA - INTERACTION BETWEEN MICROORGANISMS AND PESTICIDES

B.T. JOHNSON, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Pure cultures of bacterial species commonly inhabiting soil, water and fresh-water fish will be investigated to determine the role they perform in the metabolism of heptachlor. Variables of pH, temperature, oxygen-tension, etc., will be investigated. Analysis and identification of metabolites will be done utilizing gas chromatography and infrared spectroscopy.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0646, CHRONIC EFFECTS OF MALATHION ON BLUEGILLS

H. KENNEDY, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The purpose of the work is to measure chronic effects from the exposure of bluegills and channel catfish to malathion at Columbia, Missouri. The fish are exposed to single and multiple sets of treatments in ponds, at three concentrations. Samples are withdrawn at intervals, and fish are examined for histopathology, cholinesterase inhibition, and blood chemistry, and the populations monitored for growth, mortality, presence of disease, reproduction characteristics, and quality of offspring. Comparisons among lots are made to assess effects of malathion.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0647, CHRONIC EFFECTS OF METHOXYCHLOR ON BLUEGILLS AT COLUMBIA, MISSOURI

H. KENNEDY, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to measure chronic effects resulting from the exposure of bluegills to methoxychlor in ponds at Columbia, Missouri. The fish are exposed to various levels of methoxychlor in 1/10-acre earthen ponds, and samples of fish are collected at intervals for residue analysis, histopathological studies, growth measurements, and measurements on reproduction and quality and quantity of offspring. Comparisons among groups of fish are made on these factors. Residues of methoxychlor are made in pond waters, bottom sediments, and aquatic vegetation for information on rate of breakdown of the insecticide and on the quantity and quality of the breakdown products.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0648, CHRONIC EFFECTS OF METHYL PARATHION AND ENDRIN ON CHANNEL CATFISH AND GOLDFISH IN PONDS. PESTICIDE-INDUCED CHANGES IN POND ECOLOGY

H.D. KENNEDY, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Objective: To assess the chronic effects of a multiple exposure contact treatment, utilizing methyl parathion and endrin (introduced alone and in combination), on two species of warm-water fish in 12 one-quarter acre and eight one-tenth acre ponds.

Nine one-quarter acre ponds will receive two treatments (May 20 and August 19) of the combined pesticides in three replicates of three concentrations. High treatment - methyl parathion 200 ppb, and endrin .04 ppb. Medium treatment - methyl parathion 40 ppb, and endrin .008 ppb. Low treatment - methyl parathion 20 ppb, and endrin .004 ppb. Three additional ponds will serve as controls. The one-tenth acre ponds will also receive two treatments (June 6 and September 5). Two ponds will be treated with methyl parathion at a concentration of 200 ppb, two with endrin at .07 ppb., and two will receive the combination treatment of the same levels as those of the medium treatment of the one-quarter acre ponds. Two additional ponds will serve as controls.

Samples of fish will be taken at 1, 3, 7, 14, 28, 56, and 84 days after each treatment for chemical residue analysis, stomach

samples, and for histopathological examination. Measurement of fish growth, survival, and reproduction will be made. Blood samples will be taken for hematocrit and grams percent protein levels. Effects of these pesticides on other components of the pond ecosystem; aquatic invertebrates, plankton, vegetation, mud and water for residue analysis, and water quality will also be measured.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0649, ACUTE TOXICITY OF PESTICIDES TO FRESH-WATER FISH AND OTHER VERTEBRATES

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of this work is to determine whether the uptake and activity (consequently the toxicity) of various insecticides differs among eggs, fry, various sizes of immature fish, and various sizes of mature fish. Representatives of the salmonids, centrarchids, and other families will be studied. The work will involve exposing the various life stages to the insecticides and determining relative toxicity indices.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0650, EFFECTS OF CHRONIC EXPOSURE TO METHOXYCHLOR ON THE GROWTH AND REPRODUCTION OF GUPPIES - CHRONIC TOXICITY OF PESTICIDES TO FISH

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Mature guppies will be exposed to methoxychlor in either bath or feed for at least 112 days. The effects of methoxychlor on growth, brood frequency, brood size, viability of offspring, and sensitivity of offspring to methoxychlor, will be determined. Aquaria will be set up with 40 females and 20 males initially. Samples will be removed periodically for residue analyses and histological examination.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0651, ACUTE TOXICITY OF PESTICIDES TO FRESH-WATER FISH AND OTHER VERTEBRATES

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

A stamina tunnel will be installed, techniques for its use will be developed, and studies to determine the best methods for utilizing this facility in evaluating the effects of pesticides on fish will be completed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0652, ACUTE TOXICITY OF PESTICIDES TO FRESH-WATER FISH AND OTHER VERTEBRATES

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to determine relative acute toxicity indices of a variety of pesticides, and combinations of pesticides, tested against several species of fish, under both static and continuous flow conditions of exposure. The work will involve determining TL 50 values for various periods of exposure under standard conditions of temperature and water quality.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0653, RELATIVE SUSCEPTIBILITIES OF FISH FAMILIES TO INSECTICIDES - ACUTE TOXICITY OF PESTICIDES TO FRESHWATER FISH AND OTHER VERTEBRATES

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to establish a hierarchy, in terms of relative susceptibility to insecticides, for the families Salmonidae, Centrarchidae, Cyprinidae, Ictaluridae, and Percidae. Standard bioassay methods, under both static and continuous flow conditions, will be used to determine 24- and 96-hour TL50

5. WATER QUALITY MANAGEMENT AND PROTECTION

values as indices of the susceptibility of the various taxonomic groups to representative organochlorine, organophosphate, and carbamate insecticides.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0654, EFFECTS OF CHRONIC EXPOSURE TO SUBLETHAL LEVELS OF INSECTICIDES ON REPRODUCTION IN BROOK TROUT. CHRONIC TOXICITY OF PESTICIDES TO FISH

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objectives of the work are to determine the nature and extent of the effects of chronic exposure of brook trout to sublethal levels of an organochlorine, an organophosphate, and a carbamate insecticide on gametogenesis, potency of the gametes, viability of the offspring, and susceptibility of early developmental stages to exposure to the same or other insecticides. Brook trout will be exposed to insecticides for 9-12 months prior to spawning. During the last three months samples of the gonads will be prepared for histological examination of the gametogenic processes. The volume, viability, and potency of the gametes will be determined. Developing offspring will be exposed to the insecticides at various developmental stages, and for varying periods of time, and mortality will be measured.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0655, INVESTIGATION OF STRESS-INDUCED MOBILIZATION OF INSECTICIDE RESIDUES - CHRONIC TOXICITY OF PESTICIDES TO FISH

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objectives of the work are to determine if mobilization of insecticide residues, similar to that reported for higher vertebrates, does occur in fish during periods of stress, what the effects of such mobilization are, and what organs are involved in producing such effects. The work will involve feeding DDT and dieldrin to fingerling chinook salmon for approximately 200 days. After the exposure period, the fish will be subjected to several combinations of degrees of starvation and temperature fluctuations. Residue concentrations will be measured in whole fish and various organs and tissues to determine amounts accumulated and metabolized during exposure, as well as the activity of such residues during stress.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0656, THE INFLUENCES OF ENVIRONMENTAL CONDITIONS ON THE TOXICITY OF PESTICIDES

K.J. MACEK, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to investigate the effects of variations in bioassay conditions on the toxicity of pesticides to fish. Controlled variation of temperature, water quality, mass-volume relationships, and other factors will provide information concerning the influence of such factors on fish-pesticide relationships.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0657, INTERACTION OF ENDRIN AND PROLACTIN-INDUCED FAT SYNTHESIS IN THE PLAINS KILLFISH - PESTICIDE EFFECTS ON FISH ENDOCRINE FUNCTIONS

P. MEHRLE, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Purified mammalian preparations of prolactin have been shown to stimulate the synthesis of total body fat in various species of vertebrates, including the golden top-minnow, if injected near the midlight interval of the diurnal cycle, and cause loss of total fat if injected shortly after the beginning of the light interval. This hypothesis will be tested first on another species of fish and, if proven true, the observations will be extended toward elucidating specific body lipids that may show preferential increases over others, whether selective lipid synthesis will be altered by the

presence of endrin, and whether certain lipid increases will affect endrin stores in the body.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0658, MINERAL IMBALANCE IN BLUEGILLS EXPOSED TO MALATHION PESTICIDE-INDUCED MINERAL IMBALANCE IN FISH

E.T. OBORN, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

For acute concentrations of malathion - Sexed bluegills would be exposed to acute or near acute concentrations of malathion in either/or both bath water or from capsule ingestion. Sample harvest would follow 24 hours later.

For chronic concentrations of malathion - Sexed bluegills would be exposed to chronic concentrations of malathion for 30 days in either bath water and/or in the feed. Sample harvest would follow the 30-day exposure.

After both acute and chronic exposures to malathion, brain and blood would be incubated and measured for acetylcholine hydrolysis. Additional procedures followed and methods used would be in accordance with standard colorimetric analysis. Blood smears would be taken and blood coagulation time and hematocrit percent would be measured. After dissecting and proper processing, the tissues would be examined for iron, manganese, copper, zinc, phosphorus, calcium, and magnesium content.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0659, 2,4-D UPTAKE AND METABOLISM - METABOLISM OF PESTICIDES IN FISH

C.A. RODGERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Rainbow trout, channel catfish, and goldfish will be exposed to 0.1 and 1.0 ppm of 2,4-D butoxyethanolester under laboratory conditions. Carbon 14 labeled 2,4-D will be used as a tracer to determine the areas of storage of the herbicide. Two to four gram fish will be used for the test program and the following organs will be analyzed for 2,4-D: head, liver, kidney, and muscle. Blood will also be analyzed. In addition to individual parts, an autoradiograph of the whole body will be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0660, DDT AND DIELDRIN METABOLISM AND STORAGE BY CHINOOK SALMON UNDER LABORATORY CONDITIONS

C.A. RODGERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

This work will be a preliminary investigation involving DDT and dieldrin. Various organs and tissues of the fish will be analyzed for storage, buildup, and metabolism of the pesticides. This study will involve only the following organs: brain, heart, liver, kidney, blood, storage fat, lateral line muscle, body muscle, gill, stomach and hind gut. This study may indicate if it will be meaningful to select only a few primary target organs or tissues for future work with chlorinated hydrocarbons.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0661, LITERATURE SURVEY OF PESTICIDE METABOLISM IN FISH - METABOLISM OF PESTICIDES IN FISH

C.A. RODGERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Survey all available material relating to pesticide metabolism in fish. With his survey as a guideline, a better test program can be initiated and carried out with a limited repetition of reliable work.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0662, ACUTE TOXICITY OF PESTICIDES TO FRESH-WATER INVERTEBRATES

H. SANDERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

5. WATER QUALITY MANAGEMENT AND PROTECTION

The objective of the work is to obtain preliminary acute toxicity measurements for several pesticides and several species of aquatic invertebrates at Columbia, Missouri, during Fiscal Year 1969. Invertebrates and pesticides are tested in static bioassay systems in the laboratory. The work will involve determinations of LC50 values at 24, 48, and 96 hours under static conditions involving control of animal age, water temperatures, and water chemistry.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0663, INFLUENCE OF SALINITY AND TEMPERATURE ON TOXICITY OF SOME PESTICIDES TO BRINE SHRIMP
H. SANDERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to obtain preliminary acute toxicity measurements for several pesticides to brine shrimp, *Artemia*. Temperature and salinities will then be varied to measure effects. Preliminary bioassays will be conducted at 70 degrees F. The work will involve determination of LC50 values at 24, 48, and 96 hours under conditions involving control of water temperatures and water salinity.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0664, MEASUREMENT OF THE EFFECTS OF PESTICIDES ON INVERTEBRATE RESPIRATION - ACUTE TOXICITY OF PESTICIDES TO FRESHWATER INVERTEBRATES

H. SANDERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

Invertebrates will be exposed to varying concentrations of a number of pesticides for limited time periods. Effects on respiration will be measured by using the manometric technique. Oxygen uptake and/or carbon dioxide liberation will be determined with Warburg apparatus and macro-vessels. If respiration is affected the rate and magnitude of any effects will be measured. Pesticides will be selected from all groups, i.e., chlorinated hydrocarbons, organophosphates, carbamates, etc.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0665, CONTINUOUS-FLOW INVERTEBRATE BIOASSAYS AND PESTICIDES AT COLUMBIA, MO. - ACUTE TOXICITY OF PESTICIDES TO FRESHWATER INVERTEBRATES

H. SANDERS, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective of the work is to obtain acute toxicity information on aquatic invertebrates with insecticides, herbicides, and other pesticides at Columbia, Missouri. Invertebrates and toxicants will be tested in continuous-flow systems in the laboratory according to a standard test method, and the data will be treated by probit analysis to obtain LC50 values under various time schedules.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0666, METHOXYCHLOR-CAUSED EFFECTS ON CUTTHROAT TROUT PHYSIOLOGY CHRONIC TOXICITY OF INSECTICIDES TO COLD-WATER FISH

D. SWEDBERG, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The purpose of the work is to measure chronic effects from the exposure of cutthroat trout to methoxychlor at Jackson, Wyoming. Fish will be divided into lots and sub-lots and held in pens in hatchery raceways. Some groups will be given no methoxychlor, some given methoxychlor in feed at two levels, and some given methoxychlor baths at two levels. Samples will be taken according to a pre-arranged schedule, and fish will be examined and measured for growth, pathology, incidence of disease, blood chemistry, insecticide residues, mortality, reproduction, and quality of offspring. Comparisons among lots will be made to assess effects of methoxychlor.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0667, EFFECTS OF MALATHION ON LEARNING AND RETENTION IN THE GOLDFISH

D.F. WOODWARD, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The present study will be conducted in order to evaluate the effects of sub-lethal levels of malathion on learning and retention in the common goldfish. By using alternate light and shock, the fish will be trained to avoid light by moving over a barrier into the darkened end of the test chamber. Control and malathion treated fish will be evaluated by their ability to learn the avoidance response and their ability to retain the avoidance response on reconditioning after exposure to malathion.

Since organic phosphorus insecticides exert their action by acetylcholinesterase inhibition, one would expect an exposure to malathion to have a destructive effect on the nervous system. If this is the case, there may be a modification in the ability of a fish to learn or retain a certain response pattern.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0668, EFFECTS OF HEATED WATER, ACID MINE DRAINAGE & ALKALINE ASH DRAINAGE ON WATER QUALITY & RESERVOIR COMMUNITY METABOLISM (ABBREV)

R.S. CAMPBELL, Univ. of Missouri, Water Resources Research Ctr., Columbia, Missouri 65202

A 1500 acre reservoir, constructed to provide cooling water for steam generation of electricity, receives a constant inflow of heated water. Acid drainage from strip mines, and from bottom ash piles containing sulfides, and alkaline drainage from fly ash (CaO) also enter the lake. Alkaline inflow has caused occasional fish kills. The purpose of this investigation is to evaluate the influence of these effluents on the water quality and on the autotrophic aspects of community metabolism.

Water quality evaluation will be based on routine monthly measurements of dissolved substances and on detailed seasonal determinations by the University Spectrographic Laboratory. Special attention will be given to the influence of heated water on dissolved gases and on the pattern of stratification.

The study will stress qualitative and quantitative measurement of net plankton and of bottom fauna and their relation to pollution. Measurements of primary production will be by carbon-14 fixation. We expect to establish through measurement of this fundamental process, whether community processes are significantly altered by acid, alkali and heat input.

5.0669, RECOVERY FROM ACID POLLUTION IN FOUR STRIP-MINE LAKES

R.S. CAMPBELL, Univ. of Missouri, Graduate School, Columbia, Missouri 65202

The purpose of this research is to determine the successional changes in strip-mine lakes during recovery from acid pollution. This series of lakes created by strip-mining in 1919-21 show widely divergent biological and chemical characteristics which are related to differences in acidity ranging from pH 3.0 to pH 8.6. Total acidity ranges from 5090 to 98 mg/liter CaCO₃.

These lakes were first investigated in 1940-41 and again in 1949-50. The present study dates from 1960. Successional changes are therefore documented within individual lakes and inferred from lake to lake as the acid climate is slowly altered.

In addition to seasonal physical, chemical and biological investigations, special effort is directed toward: (1) Evaluation of chemical stratification, and of the iron (Fe II - Fe III) complex; and (2) Measurement of water quality, of comparative primary and secondary production, of community metabolism and of energy flow.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0670, ISOTOPES IN THE BIOSPHERE

E.R. GRAHAM, Univ. of Missouri, Agricultural Experiment Sta. ,
Columbia, Missouri 65202

To study the movement of rain-out Sr90 from surface soil to impounded water systems.

DESCRIPTION OF WORK: Runoff and erosion experiments of plots contaminated with fission product radioactive nuclides will be continued. It is planned to use I131 and Ce144 in addition to Sr85 on the plots next year. The plots under study will be continuous bluegrass, corn stover, and wheat stubble. The collected runoff water and soil removed by erosion will be assayed as previously. Some preliminary studies on the effect of nitrogen fertilizers on growth rate of forages and the accompanying effect on the uptake of fission product radio-nuclides will be undertaken. These will be greenhouse experiments with small grains and legumes.

5.0676, AUTOMATED POTENTIOMETRIC TECHNIQUES FOR THE ON-SITE MONITORING OF ANION CONCENTRATIONS IN WATER

S.E. MANAHAN, Univ. of Missouri, Graduate School, *Columbia, Missouri 65202*

The overall objective of the proposed research is the development of new and improved techniques applicable to the automated monitoring of low concentrations of anions in water. Methods are to be developed which are simple, fast, reliable, sensitive and low in cost per sample. The analysis techniques will require a minimum of operator time.

Water resources management requires a knowledge of the nature and concentrations of solutes dissolved in water. It is desirable that such information be obtainable on a day-to-day basis and on site. The proposed research should help meet this demand for anions of interest in water quality control.

Methods to be explored for meeting the objectives of the proposed research include (1) a multi-sensor technique and (2) a standard addition technique, both utilizing anion-selective electrodes for anion sensors. These techniques are to be applied specifically to the determination of nitrate ion in the presence of interfering ions and, ultimately, to the determination of other anions such as cyanide, phosphate, sulfate, sulfite, fluoride, chloride, bromide and iodide.

5.0677, TRACE AMOUNT SUBSTANCES IN ENVIRONMENTAL HEALTH

C.J. MARIENFELD, Univ. of Missouri, School of Medicine, *Columbia, Missouri 65202*

Completion of second year of 3 year program project directed toward: the identification and characterization of trace substances in our environment; the biological interactions of such substances; and the epidemiology of the long term health effects of such trace substances. The epidemiologic methodology on a statewide basis has been developed and tested. Effects upon the embryo have been selected as the first health effect being measured using both rates per live births and coordinate mapping of occurrences of such effects to determine possible clustering.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Trace analysis techniques have been developed for water, food and air. Progress being made in increasing capacity for multiple sample analysis.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0678, RELATION OF SOIL FERTILITY TO THE EXCHANGE COMPLEX

C.E. MARSHALL, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

The general purpose is the understanding of the relationships between the proportions of cations on the exchange complex, their absolute and relative activities and the mineral nutrition of plants. This is to be a field study, to take up certain aspects of a previous greenhouse study. (Research Bulletin 285 - 'The Exchangeable Bases of Two Missouri Soils in Relation to Composition of Four Pasture Species.')

DESCRIPTION OF WORK - Field plots, consisting of 7 treatments and 14 lysimeters, will be installed. The surface 12 inches of soil will be removed with a crawler tractor and scraper. Chemical treatments will be thoroughly mixed with the soil and the mixture replaced. In addition to the untreated soil and a basal treatment of NH_4Cl , $(\text{NH}_4)_2\text{SO}_4$ and $(\text{NH}_4)_2\text{HPO}_4$, NaHCO_3 , KHCO_3 , MgCO_3 and CaCO_3 will be added in sufficient quantities to give a pH of 7 to individual plots. An additional treatment will consist of addition of CaCO_3 at four times the amount to provide a pH of 7.

Lysimeters will be of two depths for each plot, 12 and 24 inches. Equipment will be installed for collecting and sampling of drainage waters. Analyses will be made of drainage water, herbage and soil to determine nutrient movement and losses.

Missouri State Government

5.0679, NITRATES IN WATER SUPPLIES

G.E. SMITH, Univ. of Missouri, School of Agriculture, Columbia, Missouri 65202

Soils in feed lots of different ages and in various geologic areas are being sampled to depths of 15-25 feet to determine the penetration of nitrate. Included in the sampling are abandoned feeding areas where no livestock have been present for some years. Samples are also collected on transects at different distances from the area of contamination (both feed lots and sewage disposal systems) to determine lateral movement. Movement is being correlated with soil physical properties.

Detailed soil samples are being collected and topographic maps are being prepared of areas where new feed lots are being built. This information will serve as a basis for measuring changes that occur in the surrounding soil areas in the future.

Accumulation of residual nitrate from chemical fertilizers is being measured at locations where detailed soil fertility studies are being conducted with varying rates of nitrogen fertilization. Samples of soil, to depths of 10-20 feet, are also being made on individual farms where accurate records of heavy fertilization with nitrogen are available for 10 to 15 years. These results are compared with adjacent areas that have no nitrogen.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0680, NITRATES IN PLANTS

G.E. SMITH, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

A. To study the effect of N, P, K and trace element fertilization on the accumulation of nitrates in forages and vegetables. B. To investigate the effect of species and plant age on nitrate reduction in plants and the accumulation of other nitrogen fractions. C. To survey the nitrate content of domestic and livestock water supplies in the state and determine the influence of watershed fertilization on nitrate content of runoff.

Forages and vegetables will be grown in the greenhouse under different nitrogen fertilizer treatments and samples collected at different stages of growth for analysis. These samples will be used to determine the different nitrogen fractions and the reductive activities of different species.

Surveys will be made of surface water supplies and shallow wells in the different areas of the state where high nitrates have been found. Effort will be made to find the source of contamination. Runoff water from erosion plots receiving different levels of nitrogen fertilizers will be sampled to determine the amount of nitrogen lost.

5.0681, THE EVALUATION OF ENVIRONMENTAL ALTERATION BY THERMAL LOADING AND ACID POLLUTION IN THE COOLING RESERVOIR OF A STEAM-ELECTRIC STATION

A. WITT, Univ. of Missouri, Graduate School, Columbia, Missouri 65202

Thomas Hill Reservoir is subject to thermal loading in one of two of its lower arms, and in the upper end it receives a constant inflow of acid mine drainage into one of two similar arms. This provides two control arms and two experimental arms in which environmental alterations, due to thermal loading and acid water inflow, can be studied.

Field investigations will determine the effects of thermal loading on: 1. Growth of young-of-the-year and yearling fishes. 2. Survival of fishes in an altered thermal regime. 3. Movement and harvest of fishes. 4. Primary production.

Field studies will also determine the effects of acid inflow on: 1. Water quality 2. Ability of reservoir-water to ameliorate the impact of acid water. 3. Chemical stratification. 4. Benthos composition and distribution.

The results of this study will lead to a better understanding of an environment altered by heat and acid inflow, and how it may be managed for the benefit of man.

5.0689, THE IMPACT OF LEAD-ZINC MINING ON THE QUALITY AND ECOLOGY OF SURFACE WATERS IN SOUTHEAST MISSOURI

E.A. BOLTER, Univ. of Missouri, Water Resources Research Ctr., Rolla, Missouri 65401

A study is proposed to investigate the impact of Lead-Zinc mining activity on the quality and ecology of surface waters in the 'New Lead Belt' of SE Missouri. The study area now has little population and industry, but intensive mining activity will develop during the next few years.

During the investigation, the background values for lead, zinc, copper, iron, silver and cadmium in unpolluted surface waters, sediments and aquatic life samples will be determined. After pollution has started, the self-cleaning capacity of the streams by precipitation or adsorption of the metals and the uptake of the metals by aquatic life will be determined. The analyses will be done with an atomic absorption spectrophotometer.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Missouri

5.0690, SORPTION AND DESORPTION OF CHLORINATED HYDROCARBON PESTICIDES IN AQUATIC SEDIMENT MINERALS

J. HUANG, Univ. of Missouri, School of Engineering, Rolla, Missouri 65401

The proposed research project involves laboratory investigations of the sorption and desorption behavior of chlorinated hydrocarbon pesticides in aquatic sediment minerals. Emphasis is directed toward the evaluation of the effects on the sorption and desorption processes of several environmental factors, including pH, temperature, salt concentration, grain size of the sediment, and concentration of the pesticide.

Pesticides selected for this study would include DDT, dieldrin and heptachlor. Sediment minerals employed would be calcite, quartz, dolomite and three clays, kaolinite, illite and montmorillonite.

Laboratory investigations would include the following studies: 1. Preliminary equilibrium studies in order to evaluate the adsorption isotherms of pesticides with each sediment mineral. 2. Sorption and desorption studies in laboratory-controlled model aquatic systems in order to evaluate the effects on the sorption and desorption processes of several environmental factors.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Missouri

5.0691, EFFECT OF SURFACTANT MICELLES ON METAL ION REMOVAL BY FLOTATION FROM METALLURGICAL WASTEWATER

R.L. VENABLE, Univ. of Missouri, Water Resources Research Ctr., Rolla, Missouri 65401

Pollution of our water resources is now recognized as a pressing national problem. Among the serious contaminants are heavy metal ions such as copper, nickel, zinc, and lead. The proposed work will be a fundamental study of a possible way of removing such metal ions from dilute aqueous solutions by flotation with surfactants. The behavior of heavy metal ions in the presence of surfactants is complex and little work has been done to elucidate this complex behavior.

It is proposed to determine the state of solution of metal ions at various surfactant concentrations by a combination of turbidity and surface tension measurements. This is necessary to an understanding of the flotation process because the flotation characteristics of free heavy metal-surfactant molecules would be expected to be different from that of such molecules when they are incorporated into the interior of aggregates of surfactant molecules called micelles, which would be still different from the flotation characteristics of precipitated heavy metal-surfactant particles.

As a further aid to understanding the flotation process, efforts will be made to disintegrate surfactant micelles to fragments with bursts of ultrasonic energy and observe the effects of this disintegration on the efficiency of flotation.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Missouri

5.0692, REMOVAL OF METAL IONS BY FLOTATION WITH SURFACTANTS

R.L. VENABLE, Univ. of Missouri, Graduate School, Rolla, Missouri 65401

The nation's water resources are rapidly becoming seriously polluted and some of the very toxic contaminants are metal ions. If a way of removing these metal ions from solution could be

5. WATER QUALITY MANAGEMENT AND PROTECTION

developed which is more economical than present treatment methods, the technique would have potential as a means of reducing this pollution. The proposed study would be a fundamental investigation of the method called ion flotation which utilizes solutions of surface active agents or surfactants and which has potential as an economical treatment procedure.

The objectives of the proposed work are to make ion flotation studies on ions not previously investigated. The studies will attempt to determine what type of surfactant is most effective and what conditions of pH, surfactant concentration, and temperature are necessary for the method to be effective. An additional objective will be to study the effects of addition of surfactant on the state of solution and availability for flotation of the metal ions. These studies are to be correlated with the flotation studies as an aid to understanding the results obtained there.

5.0693, STREAM POLLUTION IN THE NEW LEAD BELT OF SOUTHEAST MISSOURI

B.G. WIXSON, Univ. of Missouri, Environmental Health Res Ctr, Rolla, Missouri 65401

The proposed research plan involves field and laboratory investigations to determine the initial and cumulative effects of lead-zinc mining wastes on the water quality and aquatic biota of the presently unpolluted streams in the 'New Lead Belt' of S. E. Missouri. The unpolluted water quality and natural ecological background data have already been established since mining activity is scheduled to start in the immediate future. The unique study area makes possible a before, during, and after pollution investigation. Specific objectives are: 1. To study and evaluate the initial shock of mining pollution on the water quality and aquatic biota of affected streams. 2. To study and evaluate the cumulative effects of increasing amounts of mining pollution upon water quality and ecological systems. 3. To determine water quality and aquatic biota in control unpolluted streams in the area which will not be affected by increased population of new industry. 4. To evaluate and correlate all the investigative data and relate the findings to the unpolluted control streams and initial background survey of the streams in the study area.

Pollution effects on water quality would be evaluated by changes in pH, dissolved oxygen, turbidity, color, alkalinity and water hardness. Pollution effects on the biota would be evaluated by the response or changes in bacteria, algae, snails, crayfish, and fish.

The evaluation of all investigative data would provide information which will help conserve and protect healthy streams and biotic communities from future lead-zinc mining pollution.

5.0694, MICROBIOLOGY OF SLUDGE - DNA ANALYSES AND N₂ REMOVAL

R.L. IRGENS, Southwest Missouri State Coll., Undergraduate School, Springfield, Missouri 65802

We are in the process of developing a method whereby DNA may be extracted from activated sludge floc. Having perfected this method, the possibility of using DNA concentration as an estimate of the viable bacterial population of activated sludge floc will be determined. The relationship between the quantity of DNA, the oxygen uptake and the concentration of volatile solids will be investigated.

We are presently comparing denitrification by activated sludge floc at two temperatures, 23 degrees C and 45 degrees C.

Future projects involve the investigation of nitrogen removal in waste treatment at near zero temperatures and the relationship between oxygen tension and denitrification at these temperatures.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0695, WATER RESOURCES IN SOURDOUGH AND MIDDLE CREEK WATERSHEDS - A COMPARATIVE STUDY OF QUALITY AND HYDROLOGY

R.L. SANKS, Montana State University, School of Engineering, Bozeman, Montana 59715

Bozeman Creek (or Sourdough) and Middle Creek watersheds are two adjacent drainages of 30.8 and 48.2 square miles respectively, located about 10 miles south of Bozeman, Montana. The two watersheds are rather similar in size, elevation, and topography; but entirely different as to land use. Since 1917 Bozeman Creek watershed has been closed to public use, since it is one of the sources of water for the city of Bozeman. Hyalite (or Middle Creek) has always been open and has been widely used for grazing and recreation. There has been some logging on each watershed. There is currently much pressure to have Bozeman Creek watershed opened to the public. A target date of August 1968 has been set for opening but may not be met. Water samples which have been collected from selected points on both watersheds since 1964 have shown that Bozeman Creek consistently has higher counts of microorganisms than does Hyalite Creek.

The present study has been inaugurated to provide answers to the question of whether Bozeman Creek and similar watersheds which are used for municipal water supply should remain closed to human use; to pinpoint areas of potential erosion and sedimentation problems and to evaluate the severity of erosion and sedimentation on the watersheds; and to determine some knowledge of the basic hydrology of the watersheds, which will aid in planning studies on these, and on similar watersheds throughout the Pacific-Northwestern United States.

Hydrologic data to be collected includes information from a series of raingages, weather stations and streamflow recorders on each watershed. Water quality data to be collected includes pH, suspended and dissolved solids, and concentrations of various ions from selected sampling stations on both watersheds.

5.0696, MICROBIOLOGICAL STUDIES IN AN OPEN AND A CLOSED WATERSHED

W.G. WALTER, Montana State University, Graduate School, Bozeman, Montana 59715

Preliminary microbiological and chemical studies have been made during recent summers on waters serving Bozeman. One of the watersheds has been closed to the public for about 47 years except for limited logging; the other has been open for extensive logging and recreation. Quantitative and qualitative bacteriological tests have often resulted in higher 'total' enterococci and coliform counts in the closed area possibly because of closer proximity to streams of animals present.

Studies will be directed to identifying microbes in deer, elk, moose etc. droppings and to determine the presence of these bacteria in the waters at different locations, particularly in the closed watershed which may be opened soon for public use.

5.0697, HYDROBIOLOGY OF THE MADISON RIVER AND ITS HEADWATERS

J.C. WRIGHT, Montana State University, Graduate School, Bozeman, Montana 59715

A qualitative and quantitative analysis of the soluble organic substances that are released during periods of rapid photosynthesis by aquatic plants in the Madison River will be undertaken. These substances are apparently readily metabolized heterotrophically since their concentrations rapidly decrease when respiration exceeds photosynthesis.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0698, HYDROGEOCHEMICAL INVESTIGATION OF SELECTED WATERSHEDS IN SOUTHWESTERN MONTANA

M.R. MILLER, Montana Coll. of Min. Science, Graduate School, Butte, Montana 59701

Chemical characteristics of natural water are mainly controlled by the media through which the fluid passes; however, detailed rock-aggregate-water relationships are still relatively unknown. The primary goal of the proposed research is to

5. WATER QUALITY MANAGEMENT AND PROTECTION

establish quantitative and qualitative relationships between the natural geologic environment and the water chemistry.

Several small watersheds will be selected where the bedrock is known and the structure and stratigraphy are not complex. A large number of water, soil, and rock samples will be collected and analyzed for approximately 30 different parameters using atomic absorption, colorimetric, and titration techniques. Laboratory and field data will be transferred onto computer punch cards for rapid statistical evaluation

Tech.

5.0699, WATER QUALITY REQUIREMENTS FOR AQUATIC INSECTS

A.R. GAUFIN, Univ. of Montana, Graduate School, Missoula, Montana 59801

The objectives of the work are to determine the dissolved oxygen, temperature and pH requirements of the 14 species of aquatic insects. These 14 species are distributed among five different families: 1) Ephemeroptera, 2) Plecoptera, 3) Odonata, 4) Trichoptera, and 5) Diptera. It is proposed that at the completion of this research, accurate estimations of the effects to be ascertained for each of the three factors over a range of concentrations, from lethal to that of no adverse effect, will be accomplished. Interpretable measures of effect shall be used rather than any change that is observed. Although growth and reproduction are the most sensitive and significant parameters of effect, conditions will not allow their use, however, special effort shall be made to study egg production and survival whenever possible.

Lethal ranges for a short exposure shall be established for temperature and oxygen simultaneously during the initial months of the project. 30 to 90-day exposures during growth, molting, and food consumption shall be measured. Temperature is important, as pre emergence is a hazard resulting from thermal discharges and warming of natural waters during the winter months.

Optimum growth rates will be established because the insects are fish food. Further temperature/oxygen relationships are to be evaluated because minimum acceptable oxygen concentrations will increase as temperature rises. The pH tolerances and optimal ranges shall be determined in separate tests. Particular emphasis shall be placed on emergence since previous work shows that good growths of fish occurs at pH values at which spawning will not occur. This work will be accomplished at the University of Montana Biological Station which is not located on the main campus at Missoula.

5.0700, DETECTION AND SIGNIFICANCE OF ENZOOTIC WATER POLLUTION

M. NAKAMURA, Univ. of Montana, Graduate School, Missoula, Montana 59801

1. A survey of protozoa and bacteria (fecal streptococci) present in game animal feces, including deer, elk, moose, buffalo, etc. 2. A study of the survival rate of microorganisms in the laboratory under varying conditions of temperature, pH and aeration. 3. A study of the existence of fecal streptococci in vegetation to learn if fecal streptococci originates from the feed and pasture. 4. A study of the comparative biochemical and physiological properties of fecal streptococci (including the enterococci and the viridans group).

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0701, COPPER TOXICITY ON ALGAE OF THE BIG BLACKFOOT RIVER

R.P. SHERIDAN, Univ. of Montana, Graduate School, Missoula, Montana 59801

This proposal describes a water quality study of the Big Blackfoot River, and is designed to provide information concerning the effect of copper salts on the indigenous algal flora. The experimental approach will be physiological and the experiments

designed to provide data in advance of potential pollution in the form of copper salts. These data must be collected prior to the construction of the proposed Anaconda mill to add substance to arguments for the installation of control devices before pollutants are released into this river rather than after the major part of the flora has been destroyed.

Type Species Collection - Samples will be collected seasonally from the Big Blackfoot River at the headwaters near Lincoln, Montana and from several downstream stations. Clone cultures will be established from these samples, and maintained as a type collection and serve the following purposes: a.) Source of material for the proposed copper toxicity study. b.) As pre-pollution types which may be unavailable for study after pollutants have been added to the River.

Proposed Experiments - 1. Recording the relative abundance of each species in the seasonal collections. 2. Studies designed to provide quantitative data concerning the effect of copper salts on the growth, respiration and photosynthesis of each major species.

These data will be used to construct a pollution standard for copper. In addition to establishing the maximum copper content tolerated by the indigenous algal flora, projections can be made concerning the effect of copper at concentrations above those specified by the maximum pollution standard.

5.0702, INVESTIGATIONS OF THE RELATION BETWEEN THE USE OF CHLORINATED HYDROCARBONS AND THEIR RESIDUES IN CHANNEL CATFISH

L.A. WITT, State Game & Parks Commission, Lincoln, Nebraska 68509

The purpose of this job is to determine the relationship between the pattern of usages of chlorinated hydrocarbons and their residual concentrations in channel catfish tissue. Factors already being considered in this relationship are land use, land capability, rainfall, and pesticides used. The analysis of previously collected channel catfish blood and fat samples will be completed by use of a gas chromatograph equipped with electron capture detectors. A secondary objective is to gain information which may be useful in determining to what degree Nebraska contributes to the pollution of the Missouri River with chlorinated hydrocarbons.

A publishable report of this work will be completed during this segment and will be furnished in lieu of a completion report.

5.0703, EFFECT OF POLLUTION ON THE QUALITY OF SURFACE AND GROUND WATER RESOURCES

D.M. EDWARDS, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

To quantitatively and qualitatively study, in the laboratory and in the field, different components of potential contamination to water and the effect of these constituents on changing soil and water characteristics. Specific objectives are: 1. To evaluate the effects different agricultural chemicals and wastes may have upon surface and subsurface waters, 2. to determine what effect contaminated water supplies have upon the characteristics of the soil, 3. to devise improved and/or new methods of water pollution prevention and control, 4. to train graduate and undergraduate students for research in the area of water pollution, supply, treatment, and quality as related to agricultural production and rural and urban water supplies and sanitation.

Procedure: Laboratory and field studies will be conducted to determine the level and type of natural and artificial water contamination, objective 1. This information will be compiled and evaluated to allow building of simulated laboratory models. The models will be used for qualitative studies of the basic parameters of these waters and their effect upon soil conditions, as well as upon surface and subsurface water pollution, objectives 2 and 3. Finally, the information gathered from the laboratory studies will be used initially in the laboratory, and, if promising there, in the field for improved and/or new methods of water reuse and pollution prevention and/or control, objective 4. Radiological and

5. WATER QUALITY MANAGEMENT AND PROTECTION

electrokinetic techniques of electrophoresis, streaming potential, and electroosmosis will be extensively used for the study.

5.0704, BRACKISH WATER PURIFICATION BY BIOLOGICAL FUEL CELL POWERED ELECTRODIALYSIS W.A. SCHELLER, Univ. of Nebraska, School of Engineering, Lincoln, Nebraska 68508

Purification of brackish water containing 1000-5000 ppm of salts by electrodialysis appears to be more economical than any of the present day distillation techniques, but it is still expensive. A reduction in the water costs might be realized if a useful byproduct were produced in the water purification process.

The primary objective of the proposed research is to investigate the possibility of using an electrodialysis cell for brackish water purification in conjunction with a biological fuel cell powered by microorganisms capable of living in the brine effluent from the electrodialysis unit, feeding on cellulose containing materials such as hay, corn stalks, etc. and suitable for processing into cattle feed or feed supplement. Furthermore it is planned to investigate the effect of operating variables on the performance of the electrodialysis unit within the range of voltage-current-power capabilities of a battery of biological fuel cells. Finally, using the experimental results as a basis, economic evaluations will be made in order to determine the economic optimum arrangement of electrodialysis units and biological fuel cells. This is a five year program from fiscal 1966 through fiscal 1970.

5.0705, DEVELOP AND DEMONSTRATE A METHOD FOR ASSESSING THE EXTENT OF POLLUTION FROM STORM WATER RUNOFF IN AN URBAN AREA

R.A. ROHLING, Henningson Durham & Richardson, Omaha, Nebraska 68131

The Contractor will conduct a detailed engineering investigation of applicable solutions, evaluation of benefits and the economics of alternate methods for the control of pollution from combined sewer overflow from the Des Moines, Iowa urban area.

A river sampling program will be conducted to establish the basic stream quality and an investigation of the effect of the nutrients pollutional load on the Red Rock Reservoir downstream of Des Moines will be made.

The total quantity of pollutants contributed from the study area will be determined from a combined sewer overflow and storm water runoff monitoring program. A rain-gage network will be established to provide basic information to establish rainfall-runoff relationships and the effects of rainfall on combined sewer overflows. Corrective measures will be investigated, on a watershed basis, to determine the feasibility of storm sewer separation and/or temporary impoundment with controlled release with or without subsequent treatment. A detailed combined sewer separation study will be made on a combined system typical of the types of development encountered in the study area and cost data will be expanded to other areas as applicable. Evaluation of the existing water pollution control facilities will determine the capabilities for treating combined sewer overflows from storage, and recommend improvements and operation procedures as applicable to combined sewage treatment.

5.0706, WATER-QUALITY REGIMEN OF TAHOE-TRUCKEE SYSTEM

J.V. SHARP, Univ. of Nevada, Water Resources Research Ctr., Reno, Nevada 89507

The first objective is an improved understanding of the source, movement, and fate of water-quality parameters in the Tahoe-Truckee system, Nevada-California. This system is faced with accelerated degradation from disposal of Lake Tahoe basin sewage and by intensification of land and water use in the middle

and lower reaches. Specific objectives are: 1) documentation of existing time and spatial variation of water quality, 2) determination of environmental (geologic, hydrologic, climatologic) and human-associated factors which control quality of water, 3) development of a quantitative model which describes the existing water-quality regimen and which will be useful in predicting future patterns of water quality, and 4) adaptation of the model to simulation by digital computers.

The simulation technique will permit testing of the model and will provide a basis for prediction of the effects of: 1) man's actions which promote or restrain the introduction of contaminants and pollutants and 2) scheduling of water releases from sources of varying quality.

The second objective is evaluation of the applicability and usefulness of the above approach for description and prediction of water quality in large and complex natural hydrologic systems in general, using the Tahoe-Truckee system as an illustrative case.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0707, PESTICIDAL RESIDUES OF AGRICULTURAL CHEMICALS

L.L. STITT, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

1. To determine inherent modulations on 'scans' of agricultural products, soil and water resources before contamination by the pesticides. 2. To develop improved methods for analysis, identification of pesticides, and their metabolites or degradation products. 3. To determine pesticide residues and their degradation products from investigations in research and demonstration evaluations in various areas of Nevada.

Description of Work - Long range investigations will be initiated to determine build up of residues from pesticide treatments on previously untreated soils. Modified analytical methods for Nevada conditions. Determinations of residues and their metabolites will be used to set time limits for farmer use and limitations as to types of use.

5.0708, PHYSICAL AND CHEMICAL CHANGES OF RECIRCULATED HATCHERY WATER SUPPLIES

D.A. NORMANDEAU, State Fish & Game Department, Concord, New Hampshire

Unlike other phases of this project, this particular work plan and job will change somewhat from those of the previous two segments. This change is prompted by the lack of adequate facilities, personnel, the excessive cost of pursuing this program, and the inherent difficulties which would make this kind of operation impractical for New Hampshire hatcheries at this time. A substantial portion of this Work Plan should be considered as an area for a major study. By all indications, it is now apparent that this work plan is sufficiently broad as to justify the establishment of a separate project. Therefore, the goals of this work plan and job are somewhat reduced and include only one phase of recirculation.

The objective of Work Plan III, Job 1, is to evaluate and describe the physical and chemical changes which occur in waters that are recirculated and in which trout eggs and sac fry are being incubated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0709, RESIDENT POPULATION DETERMINATION

P.H. WIGHTMAN, State Fish & Game Department, Concord, New Hampshire

Objectives: Determination of the effects heated effluents will have on the existing fishery in the Hooksett-Amoskeag Impoundments as well as the tributaries.

Procedures: The effects of the increased thermal effluents on the existing fishery composition will be obtained by the use of fyke nets, pound nets, gill nets and electro-shocking equipment. Tributaries which flow into the river will be electro-shocked to

5. WATER QUALITY MANAGEMENT AND PROTECTION

determine changes in existing fish populations. Such work will be done during the summer of 1968. All fish caught in the nets will be differentiated by species; these, in turn, will be weighed, measured and counted. Fin-clipping will be necessary to mark individuals which may be caught more than once and to determine movement.

Summarization of the collected data will be accomplished during the winter months and written in report form. All findings may, in turn, be utilized in planning for anadromous fish restoration.

5.0710, STORM WATER DEMONSTRATION PROJECT - CITY OF SOMERSWORTH, NEW HAMPSHIRE

P. GUERTIN, State Water Sup. & Pol. Contr., Concord, New Hampshire 03301

The investigations to be conducted as part of this project evaluation will include: 1. A complete evaluation of the effect of chlorinating and withholding combined sewerage with subsequent discharge to the receiving stream. Chlorine dosage and contact time will be varied to determine optimum dosage and contact time. 2. The effect of chlorinated combined sewerage on a treatment facility will be completely evaluated using varying degree of mixing with un-chlorinated sewerage. 3. An exact determination of the value of injecting 'Polymers' into the sewerage to increase the flow capacity (decrease the roughness coefficient) of the pipe line. Also, a complete determination of the value of 'polymers' to obtain increased efficiency of treatment from a treatment facility.

The data collection will take place in Somersworth, N. H. The assimilation, correlation, and reporting location has not as yet been determined.

This project was initiated in December 1967. It is anticipated that the project shall be completed in Mid 1972.

5.0711, THE ANALYSIS OF AROMATIC CONSTITUENTS IN WATER USING FLUORESCENCE AND PHOSPHORESCENCE

D.W. ELLIS, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

The proposed research plan is designed to develop new methods for the analysis of aromatic compounds in fresh water utilizing techniques which will permit trace analysis.

Fractional crystallization or extraction will be employed to isolate the aromatic species from the water and to concentrate them. Chromatographic procedures, thin-layer or paper, will be used to separate specific aromatic compounds. Finally, fluorescence and/or phosphorescence, in conjunction with infrared and ultraviolet-visible absorption where obtainable, will be used to identify and analyze these compounds.

Procedures and optimum conditions will be worked out initially using synthetic mixtures. Fresh water samples, from a wide variety of sources and environments, will then be analyzed in order to test the methods which have been developed.

University of New Hampshire

5.0712, A STUDY OF ALGAL POPULATIONS ASSOCIATED WITH DIFFERENT LEVELS OF WATER QUALITY IN NEW HAMPSHIRE

A.C. MATHIESON, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

In the present investigation the species composition, periodicity and abundance of algal populations from three areas (Newfound Lake, Winnisquam Lake and New Hampton Stabilization Pond), differing with respect to water quality, will be compared in order to assist in the prediction, prevention, and control of algal blooms in New Hampshire water supplies. These three areas show a marked difference with respect to pollution, i.e., Newfound Lake has no pollution, Winnisquam Lake is

moderately polluted and New Hampton Stabilization Pond is an oxidation pond, or sewage lagoon, which is extremely polluted. A comparative study of this nature will assist in the maintenance of a high quality water supply.

Weekly samples will be taken at New Hampton Stabilization Pond, while collections will be made on alternate weeks at Winnisquam and Newfound Lakes. Samples from New Hampton Stabilization Pond will be primarily restricted to phytoplankton and floating mats of algae, while those from Newfound and Winnisquam lakes will include the attached bottom forms and the epiphytic types as well. The types, abundance, and occurrence of algae at all three areas will be enumerated throughout the year. Various techniques will be employed - Sedgwick-Rafter slide technique as outlined by Palmer (1959), a modification of the Hess Method for floating vegetation, collection of host plants and epiphytes, bottom sampling by SCUBA diving and dredging. Statistical differences will be determined between the various populations and areas studied. Routine culturing of several of the algae will be an integral part of this study - for identification of species and determination of nutrient requirements.

5.0713, DETECTION AND ENUMERATION OF VIRUS IN NATURAL WATERS

T.G. METCALF, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

It is proposed to introduce equipment and methods which will make it possible to determine the presence of virus populations in surface waters on a quantitative basis. The proposed study is directed towards development of the capability for routine quantitative monitoring of the microbiological quality of surface water. The proposal recognizes the great need for addition of a quantitative capability to existing qualitative methods for detecting the presence of viral macromolecules in water. The proposed study anticipates the forging of a powerful technical tool which can be directed toward the solution of a variety of existing problems of both fundamental and applied nature involving the virus macromolecule in water.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of New Hampshire

5.0714, ULTRAVIOLET ABSORPTION AND ITS POSSIBLE RELATION TO EUTROPHICATION IN LARGE NEW HAMPSHIRE LAKES

D.A. NORMANDEAU, Univ. of New Hampshire, Water Resources Research Ctr., Durham, New Hampshire 03824

The proposed investigation is designed to determine the feasibility of using ultraviolet absorption in lake water as an index to the degree of eutrophication of large New Hampshire Lakes.

A correlation is known to exist between eutrophication and the quantity of dissolved organic matter. Since most dissolved organic matter is known to absorb strongly in the U.V., it is believed that a correlation exists between U.V. absorption and eutrophication.

Procedures to be used in determining ultraviolet absorption will take into account interference factors. Suspended and colloidal matter will be removed by filtration. Interfering inorganic ions will be removed by ion exchange. Procedures will also be developed for rapid field determination of U.V. absorption.

Other factors to be studied will include variations in U.V. absorption as a result of: (1. seasonal changes, (2. stratification, (3. increased or decreased biological activity (e.g. phytoplankton blooms).

5.0715, BEHAVIOR OF NITROGEN IN THE SOIL

N.K. PETERSON, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824

Description of work: Nitrogen levels in undecomposed litter and soils in the vicinity of alder will be compared to that from the

5. WATER QUALITY MANAGEMENT AND PROTECTION

vicinity of white pine. The nitrogen content of drainage water from alder & white pine growing on the same soils will also be determined. In order to study nitrogen balance, the amounts of water leaching through a given amount of soil in a given time will be determined.

Samples of water, litter, and soil will be taken during the period April through October under alder and adjacent white pine or poorly drained sandy soils near small streams. Bulk density samples will be taken at each site. Ground water and stream samples will be collected for analysis for nitrogen content. The amounts of nitrogen in the drainage water coming from each site investigated will be measured in order that comparisons may be made between sites. Soil and water temperatures will be recorded at the time of sampling as will the maximum and minimum air temperatures between sampling periods.

5.0716, COMPARATIVE STUDIES OF DINOFLAGELLATE TOXINS

J.J. SASNER, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

The proposed research program will attempt to elucidate the physiological and pharmacological effects of several naturally occurring marine dinoflagellate biotoxins. Primary objectives are; 1) to culture several toxin producing dinoflagellate species in the laboratory; 2) to concentrate these cells, extract and accumulate the harmful materials; and 3) to test, in a comparative manner, their effects on living systems, particularly nervous and muscle tissues. The primary goal is to study the deleterious effects of these microorganism products on the electrogenic properties of excitable systems; including resting and action potential in nerve and muscle and parameters of contraction and tension development in muscle. Both vertebrate and invertebrate nerve-muscle systems will be tested. Similar experiments, comparing neurogenic and myogenic cardiac systems, are planned. In general, comparative studies will include the testing of toxins on invertebrate organisms, particularly Molluscs and Crustaceans which, in nature, are subject to the effects of dinoflagellate 'blooms'.

The association of paralytic shellfish poisoning and ciguatera-like poisoning with substances produced by marine dinoflagellates has closely linked commercial fisheries research with that of public health. Relatively recent chemical and biological findings concerning this association will now permit studies of the comparative effects of these naturally occurring biotoxins, as well as their specific site(s) and mode(s) of action. It is toward this understanding that this research proposal is intended.

5.0722, TREATMENT RECOVERY, AND REUSE OF COPPER WIRE MILL PICKLING WASTES

L.E. LANCY, Volco Brass & Copper Company, Kenilworth, New Jersey 07033

5. WATER QUALITY MANAGEMENT AND PROTECTION

Volco Brass and Copper Company produces 75 TPD of copper and copper alloy wire. Wastes from the pickling, bright dipping, and drawing operations consist of spent treating solution dumps, dragout, and rinse waters containing acids; alkalies; and hexavalent chromium, copper, fluoride, and copper complexing ammonium ions. Lancy Laboratories has designed a process and waste treatment system which will recover the copper electrolytically, will regenerate the treating solution, and will permit reuse of 95 % of the waste water as process water. The process is free of any significant sludge disposal problem. The project is to be completed in one year.

5.0723, EXPERIMENTS TO DETERMINE THE EFFECTIVENESS OF PHOSPHATE REMOVAL BY MEANS OF THE MOVING BED FILTER

G.R. BELL, Johns Manville Corporation, Manville, New Jersey (14-12-154)

The effectiveness of the Moving Bed Filter will be determined for the removal of suspended solids and phosphate removal as compared to conventional methods. The Moving Bed Filter (15,000 gpd) will be installed at a typical waste treatment plant to optimize the flocculation and filtration and filtration procedures for phosphate and solids removal. Design and engineering data will be developed for a fullscale installation. Estimates of the capital and operating costs for various sizes of plants also will be made.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0724, EXPERIMENTAL CLOSED WATER SYSTEM TO ELIMINATE WASTE WATER DISCHARGE FROM JOHNS MANVILLE PLANT 03, DEFIANCE, OHIO

W.E. CRAMPTON, Johns Manville Corporation, Manville, New Jersey

The objective of the project is to completely eliminate the discharge of waste water from a fiber glass insulation plant. The caustic cleaning solution presently used to clean chain conveyor belts will be replaced by a system utilizing water sprays from power driven rotating descaling nozzles. The residual particles of glass fiber and phenolic binder will be removed by fine screening followed by a diatomite filter. Dissolved phenolic binder in the water will be reused.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Johns Manville Products Corporation

5.0725, AN INVESTIGATION OF TECHNIQUES FOR THE REMOVAL OF CHROMIUM AND CYANIDES FROM ELECTROPLATING WASTES

W.V. TURNER, Metal Finishers Foundation, Montclair - Upper Montclair, New Jersey

The Metal Finishers' Foundation will conduct a two-phase research and demonstration project on methods for economically treating cyanide and chromium wastes from small plating shops. Phase I will include (a) a 'State of the Art' review of recovery techniques, (b) accumulation of data on waste stream compositions, (c) selection of techniques for bench scale study and selection of extractants and complexing agents, (d) bench scale experimental investigation of selected techniques and (e) evaluation of the test results and preparation of recommendations. This phase will require one year.

Phase II will consist of (a) the design of the process and the processing equipment, (b) acquisition and installation of the equipment in an electroplating plant, (c) operation of the demonstration plant to accumulate data, and (d) the evaluation of the data and preparation of reports.

The work will be performed by subcontract to the Battelle Memorial Institute at Columbus, Ohio. Various treatment methods, including liquid-liquid extraction, ion flotation, and precipitate flotation, will be investigated and compared.

5.0726, ANALYSIS OF THERMAL POLLUTION DISPERSION

R.C. AHLERT, Rutgers The State University, School of Engineering, New Brunswick, New Jersey 08903

The purpose of this research is to describe the dispersion of thermal effluents. Molecular and turbulent diffusional coefficients will be used to generate temperature gradients in both longitudinal and normal directions. Models which characterize these temperature gradients in terms of outfall temperature, relative effluent flow rate, and outfall location will be developed. Because of the contributions of natural convection in some outfall configurations, laboratory experiments will be used to clarify the contribution of stratification or natural convective effects in the development of cross-sectional profiles.

Recreation processes including pollution demands, interfacial transport and photosynthesis are nonlinear in temperature. Therefore, the model of stream behavior that assumes the stream to be a continuous reactor with both longitudinal and normal temperature gradients will be more precise than earlier models involving cross-sectional uniformity. Once appropriate temperature profiles have been developed for typical thermal effluent situations, these relations will be coupled with mass and energy balances. The ultimate result will be a clearer picture of the effect of thermal pollution on total stream properties.

5.0727, PROCESS CONTROL MODEL FOR OXYGEN REGENERATION OF POLLUTED RIVERS

B. DAVIDSON, Rutgers The State University, School of Engineering, New Brunswick, New Jersey 08903

A distributed parameter model of the transient behavior of dissolved oxygen in a polluted river is developed for the case where artificial, in-stream aeration is employed. The model is designed for automatic process control theory application with appropriate load and control variables defined for the particular case studied. Signal flow diagrams for the complete process control of an aeration station specifying transfer functions for the mixing cell model, measurement device for dissolved oxygen and chemical oxygen demand, error detecting devices, controller action, and final control value for the aerators will be developed.

5.0728, THE ENGINEERING APPLICATIONS OF DISTRIBUTED AND MULTIVARIABLE SYSTEM THEORY TO THE DYNAMICS OF WATER POLLUTION CONTROL

B. DAVIDSON, Rutgers The State University, School of Engineering, New Brunswick, New Jersey 08903

In line with the long range objectives of water resource research at Rutgers the Control Theory Group of the Department of Electrical Engineering is proposing a system engineering approach to the control of water pollution. The proposed program would be part of an over-all interdisciplinary effort. That is, all activities would be closely coordinated with the research in the Chemical and Civil Engineering Departments. Dynamic control techniques of optimization will be developed for a class of multivariable distributed systems. Specifically, this work would be applied to the problems of artificial in-stream aeration. Various critical parameters, such as dissolved oxygen and biological oxygen demand, will be utilized together with engineering and economic constraints in the formulation of appropriate penalty functionals. Digital system simulations will be performed for various configurations. These will employ the results of cell model simulations and available field data.

5.0729, PURIFICATION OF HARD CLAMS FROM POLLUTED WATERS

H.H. HASKIN, Rutgers The State University, Graduate School,
New Brunswick, New Jersey 08903

This project is designed to define optimal conditions for maximum hard clam activity. The activities of greatest interest are those which purify (depurate) the clams of bacterial and viral contaminants. Since purification experiments are lengthy and involved, other indicators of clam activity will be used in a study of such environmental parameters as temperature, salinity, turbidity, food levels, light, oxygen levels, etc. Uptake and disposal of bacterial and bacteriophage contaminants will be further studied in the laboratory and the results of these studies will be related to bacterial and, hopefully, enteric viral levels in the Raritan Bay estuary and its clam populations.

5.0730, WATER POLLUTION

H. HEUKELEKIAN, Rutgers The State University, Agricultural Experiment Sta., *New Brunswick, New Jersey 08903*

Objectives are (1) development of analytical methods for detecting pesticides, herbicides and phenols in water, (2) determine the presence and morphological, cultural, physiological and chemical characteristics of populations of bacteria in well waters, (3) environmental factors affecting bacterial pollution of well waters and stream self purification; and (4) factors affecting efficiency of septic tank operations.

Current analytical methods will be modified, tested and used in the analyses of representative samples of potable waters. Model systems will be developed for laboratory studies of bacteria appearing in polluted water. The effectiveness of various diatomaceous materials for removing bacteria from polluted waters will be evaluated in relation to flow. The relative rates of oxidation of organic particles of varying sizes will be determined. Septic tank efficiency work will relate affluent characteristics to soil characteristics.

New Jersey State Government

5.0732, REMOVAL OF PHOSPHATE FROM WATER BY ALUMINUM AND IRON

P.H. HSU, Rutgers The State University, School of Agriculture,
New Brunswick, New Jersey 08903

The proposed research involves the investigation of the reaction mechanism between phosphate and aluminum (or iron) with its ultimate objective projected toward defining the optimum conditions for the removal of phosphate from water. The main approach in the investigation is to prepare aluminum or iron phosphates under various conditions and to characterize the products in detail.

The factors to be considered for the preparation will be the nature of phosphate removing cations M (aluminum or iron), the concentration of M, the concentration of phosphate, the M/P ratio, the NaOH/M ratio, the source of M (for example, AlCl₃ or amorphous aluminum hydroxides), the presence of other components, and possibly other factors which may develop during the progress of investigation. Precipitates will be analyzed for their chemical composition, solubility, crystallinity, and homogeneity. The solution phase will be analyzed for the nature of aluminum (or iron) phosphate ionic complexes.

Emphasis in the initial study will be on the reaction products at equilibrium state, followed by a study of the reaction kinetics.

5.0734, THE ORGANIC CONCENTRATION GRADIENT IN AN AERATION COLUMN

B.T. KOWN, Rutgers The State University, School of Engineering,
New Brunswick, New Jersey 08903

The proposed research is to investigate those chemical and physical factors, in addition to operational variables and equipment geometries, which influence the organic concentration gradient in the bulk solution of an air bubble column containing waste water. The objectives of the proposed research are to determine the factors influencing the gradient and to evaluate its possible application to the removal of the pollutants from waste water.

The initial phase of the proposed study will be concerned with the determination of the relationship between the nature of foams generated by rising air bubbles in a bubble column and the nature of the pollutants in the waste. The studies are to be made by batch equilibrium-type experiments.

The second phase of the study will involve laboratory studies of the organic concentration gradient which resulted from stripping action of the rising air bubbles and deposit of concentrated pollutants at the liquid level by ruptured air bubbles. Equipment geometries and operational variables which influence the equilibrium concentration gradient will be investigated.

The final phase of the study will be devoted to the evaluation of the possible application of the concentration gradient in the separation of organic pollutants from waste water. The application will be considered in two areas; one in which the pollutants are directly separated by removing the organic-rich-surface liquid, and the other in which the gradient is applied to improve the foam fractionation process.

5.0738, REMOVAL OF PHOSPHATE FROM WATER BY ALUMINUM AND IRON

UNKNOWN, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

(1) To study the reaction mechanisms between phosphate and aluminum or iron, and (2) to define the optimum conditions for removal of phosphate from water.

Using wet chemical and diffraction techniques, studies will be made of the nature of the phosphate-removing cations (Al or Fe), their concentration, the concentration of phosphate, ratios among these, various sources of cations, the presence of other components, and additional factors.

SUPPORTED BY New Jersey State Government

5.0739, EFFECTS OF THERMAL AND OTHER FORMS OF POLLUTION ON SOME ANADROMOUS FISHES

J.R. WESTMAN, Rutgers The State University, School of Agriculture, New Brunswick, New Jersey 08903

This research is divided into two parts: (1) the temperature tolerance and preference ranges of juveniles of four species of anadromous fishes will be determined. The species are: the striped bass, *Morone saxatilis*, the American shad, *Alosa sapidissima*, the blueback herring, *Alosa aestivalis*, and the alewife, *Alosa pseudoharengus* (2) The dissolved oxygen requirements of the four species will also be measured at three water temperatures, and at two salinities in addition to 'fresh' water. Oxygen requirements will also be measured in the presence of various

concentrations of petroleum products, of ammonia, and in the presence of both.

A temperature preference tank will be employed for determining preference ranges; and oxygen reduction will be obtained by the use of nitrogen, and by helium for comparative purposes.

Rutgers The State University

5.0741, FATE OF PESTICIDES

B.R. WILSON, Rutgers The State University, School of Agriculture, New Brunswick, New Jersey 08903

The herbicide 3,4-dichloropropionanilide, or propanil is transformed in soil by microorganisms and in pure cultures of fungi isolated from soil, to 3,4-dichloroaniline which condenses to form 3,3',4,4' tetrachlorobenzene. Results from adsorption experiments utilizing DDT, linuron, malathion, and diphenamid in clay, soil, and humic acid systems indicate that these chemical compounds are strongly adsorbed by both clay and humic acid systems and released to the soil solution at an extremely slow rate. Analytical methods have been developed for organophosphate insecticides in water. Kinetic studies of chemical oxidation of organic pesticides is continuing. Thus far, 2,4-D is the only herbicide which appears to be biodegradable.

In cabbage and crabgrass increasing amounts of the herbicide diphenamid are absorbed as a function of time which results in reduced uptake of magnesium, calcium, potassium and phosphorus.

Propanil is enzymatically degraded in rice to 3,4-dichloroaniline and other products. The enzyme responsible is contained in subcellular particles similar to the lysosomes of animal cells.

Photoaldrin, the photoconversion product of aldrin, is 7x as toxic as aldrin to mosquito larvae. Repeated sublethal exposures of mosquito larvae to ethanol or ethanol-DDT generally becomes lethal due to ethanol accumulation. Reaction of large mouth bass to parathion is being determined.

Photochemical transformations of aldrin, patoran, linuron, diphenamid, and propanil have been completed. A procedure has been devised for the determination of diphenamid in plants.

5.0743, THE PREDICTION AND OPTIMIZATION OF STREAM RESPONSES TO POLLUTANT WASTES

R. DRESNECK, Found. For Adv. of Grad. Study, Newark, New Jersey 07103

The ability of the mathematical models presently used to predict the effects of pollutant loads upon the resultant stream biochemical oxygen demand (BOD) and dissolved oxygen (DO) profiles is questionable. The problem is complicated by the fact that some of the stream parameters are difficult to measure and that the mathematical models used do not, in many instances, adequately describe the physical conditions they model.

In this research, a previously developed model is presented which makes use of measured BOD and DO stream values for particular loading conditions to evaluate those stream parameters which cannot be easily measured, and then uses them, in turn, to predict the effects of future loading situations. By testing selected streams, the effectiveness of the proposed mathematical model will be evaluated.

5.0750, MODEL STUDY TO PREDICT SALT DISTRIBUTION AND CONCENTRATION OF WATER IN SOIL PROFILES

J.F. ALFARO, New Mexico State University, Water Resources Research Inst., Las Cruces - University Park, New Mexico 88001

In irrigated lands, salts are accumulated within the root zone as a result of irrigation and subsequent removal of water by the

5. WATER QUALITY MANAGEMENT AND PROTECTION

processes of evaporation and transpiration. In arid regions, such as the State of New Mexico, the salinization problems become more accentuated because there is less rainfall available to leach and transport the salts, and because of further salt concentration in soils and surface waters due to the high evaporation rates characteristic of these zones.

This study will work toward developing a method to predict salt concentrations in stratified soil, uniform and non-uniform soils, and to determine the effect of initial salt concentrations, soil moisture and salt concentrations of irrigation water on the accuracy of prediction, and to investigate the soil responses to the application of irrigation water of various qualities.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
New Mexico State University

5.0751, WATER REQUIREMENTS FOR SALINITY CONTROL IN UNSATURATED SOILS

H.E. DREGNE, New Mexico State University, School of Agriculture, Las Cruces - University Park, New Mexico 88001

This project is directed toward one of the most important problems facing irrigated agriculture in the Western States and in all irrigated areas in the world. The need for applying limited amounts of water to the soil is illustrated by the following points.

1. Two of the irrigated areas in New Mexico, the Pecos and Gila River basins, are limited in annual water application to three acre-feet per acre, or less, by recent court decisions. This eliminates the free use of water for leaching salts from the soil. 2. With limited water application, salt build-up becomes a major problem in the management of the land and the water. 3. The water pollution control regulations presently being put into operation will demand that salts added to the water supply by irrigation be held to a minimum. This would apply both to areas with full water supplies as well as those with limited water supplies.

The results could have application to New Mexico, the Southwest, and other areas of the United States and to the world wherever irrigation is practiced. Irrigation must become a more nearly exact science, and it is to develop one phase of that science that this project is proposed.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

5.0752, SOILS, PESTICIDES, AND THE QUALITY OF WATER

H.E. DREGNE, New Mexico State University, Agricultural Experiment Sta., Las Cruces - University Park, New Mexico 88001

Objectives: 1. To establish whether movement through the soil constitutes a significant source of the pesticides found in surface and ground water. 2. To identify the properties of pesticides and of soils that control the extent of movement of pesticides in and through soils. 3. (New Mexico will not contribute to this phase of the work.) 4. To ascertain the effects of management of pesticides and land on the transport, by all means, of pesticides to water supplies.

Description of work proposed: Leaching columns of varying lengths will be used to follow adsorption, release and movement of herbicides, including betasan and derivatives of 2,4 dichlorophenoxy-acetic acid applied to various soils. These soils will be characterized mineralogically, physically, chemically and biologically by standard methods. Soils having different textures will be selected for study, and organic matter content, time content, and exchangeable cation status will be varied. Herbicide movement will be followed under conditions of continuous leaching and alternate wetting variables and to the chemical properties of the herbicides. Field studies will be used to determine the extent to which herbicides applied to the soil move through and over the soil in the presence of close-growing and row crops under a variety of soil and water management conditions.

5.0753, FEASIBILITY OF TREATING AND RECYCLING USED FISH HATCHERY WATER

R.E. SPEECE, New Mexico State University, Water Resources Research Inst., Las Cruces - University Park, New Mexico 88001

The most common problem in fish hatchery operation is a limited water supply, particularly during drought periods. Some hatcheries are also hampered by year-round water shortages. Appropriate treatment of the used water to restore the necessary quality characteristics for subsequent recycling offers the most promising solution to this problem. It would also permit construction of new fish hatchery facilities at sites with limited water supplies.

A treatment system, capable of removing ammonia, carbon dioxide, organic metabolites, disease producing organisms, and providing for restoration of the dissolved oxygen will be developed. A cost analysis of the treatment and recycle system will be made for several typical installations. A corresponding benefit analysis, based on increased fish production, will also be determined for the same installations. This will enable a benefit-cost ratio to be determined. Thus, conditions where treatment of used fish hatchery water for recycling would be economically feasible can be determined.

5.0757, MORPHOLOGY AND STABILITY OF STREAM CHANNELS IN SOUTHWESTERN SEMIARID RANGELAND WATERSHEDS

R.B. HICKOK, U.S. Dept. of Agriculture, Santa Rosa, New Mexico 88435

Objective: Methods for predicting and control of gulley and stream channel erosion, and sediment deposition damage.

Plan of Work: Evaluate processes of channel aggradation, degradation, horizontal realignment, and changes in cross-sectional shape and net sediment yield in relation to types of bed and bank materials, upstream sediment sources, streamflow regimes and control measures.

5.0758, TREATMENT NEEDED BY SEWAGE BEFORE INJECTION - WELL RECHARGE

L.J. HETLING, State Dept. of Health, Albany, New York

Sewage effluent from a secondary (bio-filtration) plant will be given tertiary treatment including, but not limited to, rapid sand or diatomaceous earth or carbon column filtration. The effluent will then be recharged by injection well; at the same time, a portion of the effluent will be injected into a ground simulator. Both the ground simulator and the injection well will be loaded to failure to determine the factors that cause failure of the system. The treatment requirements for sewage reclamation for well recharging will be demonstrated.

5.0759, SPRING CREEK AUXILIARY WATER POLLUTION CONTROL PROJECT

M. LANG, State Dept. of Pub. Works, Albany, New York

Phase I: To characterize and evaluate the combined sewer overflows into Jamaica Bay and relate their significance to sewage plant effluents, storm runoff, landfill leachants, dredging and tidal interchange. To determine the physical, chemical, bacteriological and biological characteristics of Jamaica Bay as effecting its recreational values. Develop mathematical models for dissolved oxygen and coliform in Jamaica Bay.

Phase II: Study in greater detail the conditions in the waters most affected by the discharges from the Spring Creek combined sewer overflow.

Phase III: The Spring Creek Auxiliary Pollution Control Plant must be completed before Phase III can be started. The objective of this Phase is to survey the areas of Jamaica Bay studied during Phase II, and the effluent from the Spring Creek Plant, and make a quantitative evaluation of the treatment processes and the results achieved.

5.0760, COMPOSITION OF RESIDUES FROM PULP BLEACHING TREATMENTS

C.W. DENCE, State University of New York, Graduate School, Albany, New York 12203

The spent liquors from kraft chlorination and alkali extraction pulp bleaching sequences are to be examined by various chemical and physical means to determine the structure and composition of the modified lignin residues contained therein. Special emphasis will be placed on establishing the presence or absence of o-quinone intermediates in the chlorinated pulps and in the chlorination spent liquors. This phase of study will be prefaced by a detailed study of the reactions lignin-like (model) compounds with chlorine in which attempts will be made to isolate and characterized the anticipated o-quinone intermediates. Attempts also will be made to characterize the products arising from reactions of the (proposed) o-quinone intermediates and other sub-

stances likely to be present in the bleaching system. Finally the reactivity of chlorolignin toward alkali will be examined to gain an insight into the structure of the resulting residues particularly insofar as the location of the chlorine substituents on the chlorolignin molecule is concerned.

5.0761, RENOVATION OF A DYSTROPHIC LAKE INTO A EUTROPHIC LAKE

K.E. DAMANN, State University of New York, Graduate School, Brockport, New York 14420

A regular weekly collection program was initiated at McCargo Lake on the Fancher Campus of State University of New York, College at Brockport, early in March, 1967. Preliminary investigations involved exploring the entire area of the lake with the hope of establishing a limited number of stations that might be considered typical for study of the chemical and physical factors related to biological activity.

Chemical analysis were performed weekly at the Fancher Campus laboratory on water collected at three levels (surface, 10', bottom) for the following parameters: Dissolved Oxygen, Carbon Dioxide, Calcium, Magnesium, Silicates, Phosphates, Nitrates, Hydrogen Sulfide, Alkalinity, pH.

Duplicate samples collected from three levels were analyzed each week in the laboratories on the Brockport Campus using more precise wet chemical methods for the following: Inorganic Nitrogen, Organic Nitrogen, Nitrates, Chlorides, Orthophosphate, Poly-phosphate, Sulfates, Sulfites.

The Perkin Elmer, Model 303, Atomic Absorption Analyzer has been placed in operation and will be used for routine analyses during the remainder of the project.

Macro-bottom fauna, aerobic and anaerobic bacterial plate counts, direct microscopic bacterial counts from submerged slides, and a census of the fish population were the areas of biological investigation carried on during 1967-68.

Total plankton counts were made weekly at the same three levels used for the chemical analyses. In addition, a preliminary periphyton study was done by submerging glass slides at three levels. This work will be carried on in much more detail during 1968-69.

Two fiber glass cylinders (20' x 6') have been permanently located in the experimental lake. Aerating filters are installed and will be operated on an experimental basis during a portion of 1968. After determining the effect of aeration on chemical, physical and biological activity during a complete cycle, a decision will be made on whether or not to aerate the entire lake.

5.0762, THE BIOCHEMISTRY OF ANAEROBIC DIGESTION

J.S. JERIS, Manhattan College, School of Engineering, Bronx, New York 10471

Investigations in anaerobic digestion have shown that the process has great potential for treatment of concentrated complex wastes. Yet, the process is not being used to its maximum potential because of a lack of fundamental knowledge of its microbiology and biochemistry.

The general objective of this proposal is to explore further the basic biochemistry in order to determine the general pathways involved in the anaerobic microbiological breakdown of various pure organic compounds which are constituents of complex wastes. Some of the compounds under study include propionic acid, lactic acid, succinic acid, glutamic acid, glycine, and oleic acid.

The role of intermediate compounds such as acetic, propionic and butyric acids is under study as they appear to be very important metabolic products.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0763, NEW SELECTIVE MEMBRANES

J. STEIGMAN, Polytechnic Inst of Brooklyn, Graduate School, Brooklyn, New York 11201

5. WATER QUALITY MANAGEMENT AND PROTECTION

This research will consist of theoretical and experimental studies of the transport of ions through chemically modified extruded cellulose membranes. Previous work has shown that the small number of carboxylic acid groups in a cellulose membrane adsorb polyvalent ions like calcium, that amidification of the groups virtually eliminates the adsorption, and that the transport of calcium in amidified membranes is slower than that of sodium in quite dilute solutions. Work will be done on further chemical alteration of membranes and on the transport of various univalent and polyvalent cations (and on the effects of various anions) as well as on the transport of water itself in commercial cellulose and in chemically modified cellulose membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

5.0764, DEPOSITION OF FINE SEDIMENTS IN TURBULENT FLOWS

E. PARTHENIADES, State University of New York, School of Engineering, Buffalo, New York 14214

The proposed project concerns the hydrodynamic behavior of fine cohesive sediments in turbulent flow fields such as those created by open channel flows. The primary general goal is the discovery of the flow parameters, which control the initiation, the degree and the rates of deposition of that sediment and the derivation of analytical relationships between these variables for only one type of sediment. Recent investigations by the writer and others revealed some important relationships between certain flow parameters such as average boundary shear and secondary flow, and some depositional characteristics, such as the percent of fine load deposited under given flow conditions. The specific objectives of the proposed study are: (a) Effect of secondary currents on deposition and in boundary shear stress distribution together with an attempt to express them in terms of readily determinable flow parameters. (b) Effect of boundary roughness on depositions. Some pilot studies of the effect of sediment properties and water quality on deposition are anticipated.

The information sought is needed for rational control of shoaling, prediction of deposition sites of solid waste disposed in the form of fine sediment and selection of disposal sites to avoid pollution of specific zones.

5.0767, NEUTRON ACTIVATION ANALYSIS OF IMPURITIES IN RAIN AND SNOW

I.G. HAN, State University of New York, Graduate School, Fredonia, New York 14063

The goal of this project is to determine the average concentration of Ca and S in samples of precipitation collected in the vicinity of Fredonia which is located at the leeshore of Lake Erie. The lake effect storms characteristic of this region make it possible to study the meteorological functions affected by the large polluted lake.

Samples of rain and snow water will be activated in a reactor and will be analyzed to determine the average concentrations of Ca, K, and S of lake effect storm precipitation and non-lake effect storm precipitation separately.

The results will be correlated with meteorological variables in an attempt to pursue understanding of the role of these elements over the large polluted lake as materials for condensation nuclei, of the efficiency of precipitation for removing these elements from the air, of the probable origins, and of the characteristics of the lake effect storm.

According to the work done by Junge and others on the chemical concentration of rain water over the United States, precipitation samples of lake effect storms collected at the leeshore of a large lake will show chemical concentration ratios close of those of lake water if the lake is large enough. The assumption is supported by the Cl/Na ratio of the rain and snow water from lake effect storms and non-lake effect storms which was collected in the vicinity of Fredonia and analyzed by the applicant of this proposal in the summer of 1966.

The project is the continuation and expansion of the work on Cl and Na. The concentrations of Ca, K, and S are very high in the Lake Erie water. Preliminary samples with the activation method.

SUPPORTED BY State University of New York

5.0768, DISCHARGE OF INDUSTRIAL WASTES TO MUNICIPAL SEWER SYSTEMS

V.C. BEHN, Cornell University, School of Engineering, Ithaca, New York

The ultimate objective of this work is to prepare, for selected water using industries in New York State, results which should be of direct value to any industry contemplating the discharge of wastes into a municipal sewer system.

The study will concentrate on four different groups of plants, all of which are well represented within New York State. These four are pulp and paper mills, organic chemical plants, canned fruits and vegetables, and blast furnaces and steel mills. Two sites will be selected for study from each group of plants to represent small and large industries.

Feasibility studies will be run involving the following factors: equalization, neutralization, nutrient requirements, and sludge flow and handling characteristics. These will then be combined with a survey of sewer ordinances and rate structures now being applied within New York State.

The results should aid any industry now faced with a decision on whether or not to treat wastes separately or discharge the wastes into a municipal sewer system.

5.0769, DESIGN OF WASTEWATER TREATMENT SYSTEMS TO SATISFY EFFLUENT QUALITY REQUIREMENTS BASED ON INTENDED USE

A.W. LAWRENCE, Cornell University, School of Engineering, Ithaca, New York

It is the objective of this study to have a 'fresh' look at wastewater treatment processes and systems in light of the growing interest in the reclamation of wastewaters as a 'new' source of water. This fresh look or reevaluation of wastewater treatment technology will be directed towards:

1) a review of the intended uses for reclaimed waste waters and determination of the quality requirements associated with each use.

2) a reevaluation of existing wastewater treatment processes and systems in the context of expected future performance criteria, i.e., effluent quality requirements.

3) examination of new processes or new combinations of existing processes in an effort to develop treatment methodology capable of satisfying effluent quality requirements which are not presently attainable.

5.0770, ADAPTATION BY MICROBIAL POPULATIONS
N.C. DONDERO, State University of New York, School of Agriculture, Ithaca, New York 14850

Selected experiments on enzyme adaptation and repression have been made with pure cultures and mixed populations of microorganisms derived from activated sludge for the purpose of determining the physiological and nutritional homogeneity or heterogeneity of the populations transforming aromatic materials and other carbonaceous substrates.

The analysis of the populations have been made previously by enumeration and replica-plating on a series of substrates planned to show the capabilities of the population to utilize the substrates present and to reveal shifts in the microbial population when they occur.

Similar analyses will be made of the microbial populations in the processes of sewage treatment and a potable water impoundment.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0771, EFFECTS OF DISSOLVED OXYGEN CONCENTRATION ON SURVIVAL OF LARGEMOUTH BASS EMBRYOS

A.W. EIPPER, State University of New York, School of Agriculture, Ithaca, New York 14850

Objectives of this project are 1) To determine the effect of various oxygen concentrations on the survival of largemouth bass embryos until hatching, 2) To determine effects of interactions of temperature and oxygen on the survival of largemouth bass embryos until hatching, and 3) To determine effects of interactions of water movement and oxygen on survival of embryos until hatching. Construction of a 'degasser' to control dissolved oxygen concentrations in aquaria was completed early in 1968, and literature work on the effects of oxygen survival of fish embryos was begun. During the 1968 bass spawning season, lots of 50 bass embryos of known age were subjected to different oxygen concentrations at each of three different temperatures. The azide modification of the Winkler method was used to monitor O₂ levels, and dead embryos were removed each day. Preliminary analysis indicates that survival of embryos to normal larvae at oxygen levels above 2.1, 3.0 and 3.4 mg/liter at 15, 20 and 25 C, respectively, is similar to survival at 90% oxygen saturation for each temperature. At lower oxygen levels, survival decreases sharply. Approximations of LD50 levels would be 1.3, 2.3, and 3.1 mg/l for 15, 20 and 25 C, respectively. For the same temperatures, oxygen levels of approximately 1, 1.5, and 2.1 mg/l caused complete mortality. Further analysis of data is in progress and will continue through the coming academic year.

5.0772, EFFECT OF WATER QUALITY ON FIRST-YEAR MORTALITY OF LARGEMOUTH BASS

A.W. EIPPER, State University of New York, New York Coop. Fishery Unit, Ithaca, New York 14850

The objective of the proposed project is to contribute to establishment of water quality standards by determining the effects of temperature, oxygen concentration and other aspects of water quality on mortality of largemouth bass during the egg and larval stages. Information on factors affecting first-year mortality of game fish species is also essential for management of populations necessary to increase the capacity of water resources to produce food and recreation. Investigations of causes of first-year mortality conducted by the New York Cooperative Fishery Unit will be continued and expanded. Additional equipment for temperature and oxygen control and monitoring will be employed to study survival of eggs and fry at various levels of temperature and dissolved oxygen. The relationships of turbidity, pH, and alkalinity to mortality will also be evaluated. Studies of the effects of water quality on predators, kinds and quantity of food available to fry, and other ecological phenomena are also planned. After

preliminary observations and monitoring in nature, mortality factors will be evaluated under controlled laboratory conditions, and attempts will then be made to determine if relationships observed in the laboratory apply in earthen ponds and natural waters.

5.0773, LIMNOLOGICAL INVESTIGATION OF ONEIDA LAKE

D.J. HALL, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

Objectives: 1. Investigate current nutrient conditions in Oneida Lake in light of possible nutrient enrichment. 2. Examine relationship between continuous nutrient recycling and plankton production. 3. Determine the fate of the zooplankton in Oneida Lake.

A two-year study is proposed in which extensive year-round water analyses, quantitative plankton and fish collections will be made in order to ascertain fundamental relationships in the food chain dynamics of Oneida Lake. Analyses of phosphorus, nitrogen and other selected nutrients will be routinely carried out. The rate of nutrient regeneration will be examined in relation to the unusual summer circulation (mixing) pattern in the Lake. The primary production of phytoplankton using the C14 technique and zooplankton population turnover rates will be estimated from appropriate field experiments and analyses. Extensive examination of fish stomachs collected by the Cornell Department of Conservation will yield information about the possible fate of zooplankton in this system.

New York State Government

5.0774, EQUIPMENT TO AGITATE POND SOILS FOR RELEASE OF NUTRIENTS

E.S. SHEPARDSON, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

To develop principles and techniques for: (1) aggressively disturbing pond bottom sediments, (2) effectively produce a suspension of same and (3) the introduction of powdered limestone simultaneously into the disturbed suspension of bottom sediments. Develop the equipment and techniques to sufficient efficiency, portability and use with small boats to dispense large quantities of limestone in waters of moderate size (up to 50 acres).

Various ideas will be investigated to determine the best way(s) for plowing, harrowing, jetting or otherwise disturbing pond bottom sediments sufficiently with surface controlled equipment. Simultaneously, a means for suspending this material, temporarily, will be investigated. At the moment, air injection appears to be one possible technique. Mechanical beaters may be another approach. Following the development of the principle of satisfactorily rooting up and suspending the bottom sediment, a means of effectively introducing ground limestone into the disturbed mass will be sought. The exact course of investigation will depend on the above developments.

Appropriate pond soil and water tests will be made in the field test of the device to determine the immediate and seasonal effects of the treatment.

New York State Government

5.0775, POULTRY MANURE PROPERTIES, HANDLING AND DISPOSAL

A.T. SOBEL, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

1. To determine the chemical, physical and rheological properties of poultry manure related to handling, disposal, and/or utilization. 2. To investigate basically several methods of disposal and utilization.

The properties related to handling, disposal or utilization of manure will be determined. Samples will be gathered from various sources to obtain a broad range of breed, management, and

5. WATER QUALITY MANAGEMENT AND PROTECTION

other factors which will influence the composition and quantity of manure produced. Such conditions will be recorded so that ranges can be established for the various properties, as the extremes of these ranges are important in handling the manure. The manure will be investigated as a solid waste and as a suspension in water. This information will then be used in trial methods in the laboratory (or in the field if indicated) and the results extended to consider what would be involved in handling larger quantities of manure.

5.0776, THE LOSS OF ORGANIC AND INORGANIC MATERIALS FROM ABOVE-GROUND PLANT PARTS, WITH REFERENCE TO DECONTAMINATION OF PARTS UTILIZED FOR FOOD

H.B. TURKEY, State University of New York, School of Agriculture, Ithaca, New York 14850 (AT(30-1))

Appreciable quantities of inorganic and organic metabolites are leached from above-ground plant parts by rain and mist. Mineral nutrients, amino acids, organic acids, and carbohydrates are leached from a wide range of plant species. Young plants, including food plants, are grown in radioactive nutrient solutions and are leached with a water mist. The leachates are collected on resins and losses by leaching are determined quantitatively by radioactive analysis and qualitatively by chromatographic means.

Important areas of investigation are: 1. Leaching of fallout products from food plants in relation to absorption and distribution of the fallout within the plant, 2. Influence of specific chemicals on leaching, such as surfactants, 3. Leaching of organic metabolites, 4. Leaching of growth regulating substances.

Leaching is influenced by species, metabolites being leached, leaf morphology and age, nutrition, environmental factors, injury, and duration and intensity of rain. Inorganic and organic metabolites leached from one plant are root-absorbed and utilized by other species. Leaching of calcium and other cations involves exchange reaction both within the plant and on the leaf surface. Leaching is an important ecological factor in plant development and association. It plays a role in the distribution of fallout products and the natural decontamination of plants.

5.0781, SEPARATION OF SANITARY SEWAGE FROM COMBINED SYSTEMS OF SEWERAGE

M.B. MCPHERSON, Amer. Soc. of Civil Engrs., New York, New York (14-12-29)

The general concept on which the project is based involves discharging comminuted or ground sewage from individual buildings and/or building complexes through relatively small pressure tubing laid in existing building connections, and thence into new pressure conduits suspended in existing street sewers. The new separate sanitary sewage pressure conduits would then discharge into existing interceptors that would convey the sanitary sewage to treatment works. Storm water alone would be carried in what were formerly combined sewers. The most comparable alternative to meet the same objective is traditional, complete separation by means of new sanitary sewers and attendant separate sanitary and drainage building connections. The project scheme was conceived by Dr. Gordon H. Fair of Harvard University.

The basic objectives of the project are to determine the physical feasibility and limitations of the project scheme or modifications thereto, and to arrive at measures of cost for comparison with the traditional method of separation for evaluation of investment feasibility.

Headquarters for the project are provided by Harvard University at 40 Oxford Street, Cambridge, Mass. 02138.

National Pollution Control Foundation

5.0785, COMPUTE SIMULATION OF DIFFUSION STUDIES

E. MEHR, New York University, Geophysical Sciences Lab., New York, New York 10003

The objective of this grant is the study of Monte Carlo simulation models for both diffusive and turbulent phenomena, and their application to water pollution problems.

The Diffusion Simulation Model will simulate streams and estuaries in both one and two dimensions. Further the third dimension will be simulated by means of two or three depth layers. Results will be checked by means of available data.

The Turbulent Simulation Model - The classical approach to estuarine diffusion problems essentially involves specifying initial and boundary conditions, assuming or calculating values for mixing coefficients and solving the resulting differential equations. In applications the problem is frequently solved for a wide range of conditions and values for mixing coefficients since these quantities may not be known to a high degree of accuracy. A detailed discussion of the advantages and disadvantages of this approach is not the purpose of this report. Suffice to say that alternate approaches to the problem are of interest.

The purpose of this phase of the research is to investigate an alternate approach. The approach is to develop a model for small scale velocity disturbances that can simulate the role of turbulence in estuarine diffusion problems. The details on the structure of this velocity field is given in the next section; here a brief outline of the procedure is presented. The turbulent velocity field is simulated in the computer by specifying the flow characteristics in a combination analytic-random fashion. In principle the adequacy of the simulated turbulence can be checked by comparing the simulated Reynolds stress functions, velocity correlation

functions and power and cross power spectral functions with observations from laboratory and field measurements. Once the simulation model has been judged successful then it can be applied to estuarine diffusion problems.

5.0786, ENVIRONMENT AND VIRUS-HOST INTERACTIONS IN FISHES

A. PERLMUTTER, New York University, Graduate School, New York, New York 10003

A considerable literature exists on the relationship of aquatic pollution to fishes and the fisheries particularly in regard to the lethal effect of industrial pollutants and insecticides on juvenile and adult fish. However, there is little information on the sublethal effects of such substances and their possible influence on the progeny of animals which survive exposure to the substances. Also, although the literature indicates that embryonic stages of fishes are most susceptible to unfavorable environmental conditions, the relationship of embryonic development to sublethal levels of pollution is not well understood. Further, little attention has been given to the role of the viruses as pollutants in the aquatic environment.

Our research objectives are therefore directed towards study of the interrelationship of viruses, sublethal levels of chemical pollutants and insecticides, and other environmental factors on the tissues and embryonic stages of fishes. In its initial stage, the study will be restricted to tissue cultures of: rainbow trout gonad (RTG 2); inbred strain of platyfish, 163A; and zebrafish. Embryological studies will be limited to the latter two species. Zinc salts, chlorinated hydrocarbon and organophosphorus insecticides in common use, and a known fish virus, infectious pancreatic necrosis (IPN), will be tested under various conditions of temperature, pH and light to determine their individual and combined effects on fish tissue and developing embryos.

5.0787, THE SPREADING OF OIL FILMS

H.G. SCHWARTZBERG, New York University, School of Engineering, New York, New York 10003

One objective of the proposed research is to determine the effect of oil volume and physical properties on the area and rate of spread of area of oil films formed by the spilling of oil on quiescent water.

The second objective is to determine how oil film area and rate of spread of area and film travel are affected by the dynamic forces, such as wind, wave, current, and tide action, encountered at sea.

These objectives are designed to provide an ability to predict oil film spread and travel following accidental large scale spillages of oil at sea. This predictive ability is necessary for the effective use of available resources in combatting the pollution caused by such spills.

5. WATER QUALITY MANAGEMENT AND PROTECTION

An exploratory project has begun to determine whether organic pollutants can be removed from water by their partial or complete oxidation to carbon dioxide and water using a solid material as a catalyst and air as the oxidizing agent. Such a procedure would have economic advantages as air is inexpensive, but there are no known effective oxidation catalysts that operate under the desired conditions.

One reason for this has been the lack of investigation in this area. Therefore, the use of rare metal catalysts on supports and metal oxide catalysts, are being investigated. Also use will be considered of inorganic oxidants and of their regeneration after use.

Positive results with a system will determine which type of catalyst will receive the most study.

5.0790, MICROFLOTATION AND FLOCCULATION OF NATURAL COLLOIDAL SYSTEMS

E.A. CASSELL, Clarkson College of Technology, School of Engineering, Potsdam, New York 13676

This grant will provide for theoretical and experimental studies concerned with the development of technology for removing suspended organic and inorganic colloids from aqueous suspensions by a unique microflotation technique. Electrochemical studies will be made of charge reversal and natural colloid flocculation in order to establish optimum conditions for microflotation. The engineering applicability of microflotation to water renovation technology will be determined by comparison with conventional flotation and coagulation and settling techniques.

5.0791, THE SURFACE SHEAR VISCOSITY OF MONOMOLECULAR FILMS

F.C. GOODRICH, Clarkson College of Technology, Graduate School, Potsdam, New York 13676

Public awareness of problems of water pollution has been stimulated by the increasing presence of foams on natural surface waters. The objective of the proposed research will be to make a quantitative study of the rheological properties of matter in the boundary state, under the assumption that the behavior of thin films undergoing fluid flow plays an important role in the macroscopic properties exhibited by foams and emulsions.

Previous work in this area has been universally hampered by the lack of a suitable hydrodynamic analysis of the flow patterns in a fluid system in the neighborhood of a viscous interface, so that it has been impossible to disentangle the effects due to the viscosity of the bulk fluid from those due to the surface viscosity of adsorbed films.

The proposed program is based upon an already successful mathematical analysis of the hydrodynamic problem and would make the mathematical results of practical utility to experimenters. At the same time, an experimental program would be initiated which, together with the computer results, would permit for the first time a quantitative measurement of the absolute surface viscosities of monomolecular films.

5.0793, AQUATIC PLANT CHEMISTRY-ITS APPLICATION TO ECOLOGY

R.T. LALONDE, State University of New York, Graduate School, Syracuse, New York 13210

The demonstration that some aquatic plants produce protistostatic and antibacterial chemical materials strongly suggests that these plants could affect water quality through a mechanism of chemical interaction with other water organisms. While an adverse effect could possibly result from the poisoning of bacteria which consume organic material in the water, a beneficial effect could possibly result through elimination of undesirable organisms which in high populations would make water suitable for consumption, recreation or the support of wildlife.

Therefore, it is the objective of the proposed research to determine the chemical structure of known antiprotistic and antibacterial chemical materials, to search aquatic plants for new chemical materials, to isolate them and establish their chemical nature and at the same time to obtain information pertaining to the relevant biological activities of these new chemical agents and to determine their distribution in aquatic plants.

5.0795, BIOLOGICAL TREATMENT OF ACID MINE WATER

P.A. RICE, Syracuse University, Research Institute, Syracuse, New York 13210

A three-year study is proposed to test the feasibility and to gather basic process data on the treatment of acid mine water in an anaerobic biological reactor containing the species *Desulfovibrio desulfoxidans*. If initial experiments demonstrate the feasibility of biological treatment, a set of parametric experiments will be carried out to determine the relationships between the amounts of hydrogen, sulfate, ferrous, and ferric ions removed and the process conditions. Appropriate mathematical models will be developed to describe the relationships between variables and to indicate the mechanisms controlling the removal rate of ions under various operating conditions. These models will be useful in reactor scale up and in understanding the basic mechanisms of sulfate reduction.

5.0799, PIPELINE FLOW OF SOLIDS-LIQUID SUSPENSIONS

R.M. TURIAN, Syracuse University, Research Institute, Syracuse, New York 13210

The primary objective of the proposed research is to assess the effect of suspending medium characteristics and suspended solids properties on: 1. the steady state pipe flow behavior of the suspension, 2. pressure losses and other problems associated with the flow through pipe bends or other disturbances in the flow path, and 3. problems arising from sudden stoppage and subsequent start-up of the flow. The suspending medium characteristics will be varied using Newtonian liquids of different viscosities and densities, suspensions of solids fines of different concentrations and polymer average molecular weight. The suspended solids characteristics, on the other hand, will be varied using different concentrations of iso-dimensional particles, different solids densities, and different distributions of particle sizes and densities. Supplementary viscometric, settling, and other tests will be conducted to characterize the suspended systems investigated and their components. These supplementary tests will also serve to evaluate the utility and limitations of such measurements in the prediction of the pipe flow behavior of the suspension. The ultimate aim is to establish guidelines for optimum design and economic evaluation of a sludge or suspended waste pipeline or piping system.

5.0800, SYNERGISM OF PESTICIDES AND DETERGENTS

J.H. NAIR, Syracuse University Res. Corp., Syracuse, New York

We will be investigating whether a relationship exists between levels of alkylbenzene sulfonate (ABS) and linear-alkyl-sulfonate (LAS) detergents in water and the toxicity of selected pesticides. It is proposed to employ two species of fish as the test specimens. Although pesticides and detergents may exist simultaneously in the same bodies of water used by humans, little current research has been directed toward elucidating the effect of surface active agents upon absorption and metabolism of toxic pesticides.

Accordingly, fish will be exposed simultaneously to detergents and selected pesticides to measure survival and behavior. In subsequent exposures, selected liver enzyme activity will be measured during exposure to chlorinated compounds. Brain cholinesterase activity will be measured in relation to exposure to organic phosphate insecticides. From the behavior, survival and enzyme activity, a measure of the net effect of detergents upon the absorption and metabolic fate of selected pesticides may be determined.

5.0801, OXYGEN TRANSFER IN CONCENTRATED MICROBIAL SYSTEMS

D.R. WASHINGTON, Rensselaer Polytechnic Inst., School of Engineering, Troy, New York 12181

This project has at its immediate aim, the development of mathematical models to express the oxygen transfer, oxygen utilization for concentrated mixed microbial cultures. A major effort is being made to evaluate the coefficients appropriate for the models. The investigation involves the study of cultures ranging from 15 gm/l to 50 gm/l suspended volatile solids.

The long range objective of the research is to develop a biological process for the direct treatment of concentrated industrial wastes which are susceptible to biological degradation. Synthetic wastes (45% dextrose; 45% non-fat milk, 10% yeast extract) in concentrations up to 30 gm/l COD have been treated by this process with over 99% COD removal.

5.0802, INTERACTION OF HERBICIDES AND SOIL MICROORGANISMS

D.C. TORGESON, B. Thompson Inst. Plant Res., Yonkers, New York 10701

An investigation of the interactions of soil microorganisms and a group of chlorinated aromatic herbicides will be made. Specific objectives will be: (1) to isolate and characterize microbial species responsible for complete or partial herbicide degradation, (2) to characterize in relatively simple culture media the rates of degradation of this group of structurally related herbicides, (3) to study the influence of environmental factors such as clay, supplemental substrates, oxygen and pH levels and previous adaptation to structurally similar compounds, (4) to identify the routes of degradation and fate of degradation products, and (5) to determine if microorganisms capable of rapidly degrading a herbicide can be used to decontaminate soil and water.

Results from these studies should be helpful in the future design of molecules useful as herbicides but which will be degraded rapidly before they have an opportunity to pollute soil and water.

5.0803, ACCUMULATION OF RADIONUCLIDES BY VERTEBRATES

J.P. BAPTIST, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

Estuaries and brackish water areas provide a nursery ground and habitat for many commercially important fish. They also provide receiving waters for waste products, including radioactive effluents from power reactors, hospitals, and laboratories. Marine vertebrates can concentrate radioactive elements which could be harmful to them and render them useless as seafood for man. Since the marine environment is complex and each estuary is different, in some way, from all the others, various factors influencing accumulation must be studied under laboratory conditions.

The objectives of this project are to measure under controlled laboratory conditions, the accumulation and retention of radionuclides by marine fish; to study the importance of various factors which may affect accumulation; and to observe the feeding processes of commercially important fish through the use of radioactive tracer techniques.

Experiments are conducted with several marine fishes such as croakers, *Micropogon undulatus*; mummichog; *Fundulus*

5. WATER QUALITY MANAGEMENT AND PROTECTION

heteroclitus; pinfish, *Lagodon rhomboides*; bluefish, *Pomatomus saltatrix*; and flounder, *Paralichthys* sp. Accumulation of radionuclides both from sea water and from natural food containing radioactivity in known concentrations is determined.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0804, ACCUMULATION OF RADIOACTIVITY BY INVERTEBRATES

T.J. PRICE, U.S. Dept. of Interior, Radiobiological Lab., *Beaufort, North Carolina* 28516

The rapid growth of atomic energy industries and the increased use of nuclear reactors for power production have increased the possibility of the contamination of the marine environment with radioactive materials. Also, radioisotopes used in research and medicine may be disposed of in coastal waters, which are habitats for many species of commercial marine invertebrates.

Since many invertebrates are filter-feeders, omnivorous predators, and scavengers, it is probable that these animals come in contact with most components of the ecosystem. If one or more of these components contain radionuclides, it is probable that this radioactivity eventually would become associated with these animals.

Laboratory research is being done to determine the uptake, accumulation, and retention of specific radioisotopes (zinc-65, iron-59, iodine-131 and others) by marine invertebrates, including clams, oysters, scallops, and crabs. From these experiments, one can ascertain the importance of various factors which may affect accumulation; observe the metabolism of specific elements by invertebrates through the use of radioactive tracers; and study the foods and feeding activities of marine invertebrates.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0805, THE ACCUMULATION OF FISSION PRODUCTS BY MARINE FISH AND SHELLFISH

T.R. RICE, U.S. Dept. of Interior, Radiobiological Lab., *Beaufort, North Carolina* 28516 (AT(49-7)-5)

The cycling of elements in the estuarine environment is being followed by observing the movement of radioisotopes in the water, biota, and sediments. Quantitative data on the cycling of radioactive elements are important since effluents containing radioactive elements often flow into estuarine waters. With such data, it should be possible to predict the pathways taken by the radioactive elements.

The potential importance of cord grass, *Spartina alterniflora*, in conveying radioisotopes of zinc, manganese, and iron into estuarine food chains was evaluated on the basis of its annual production, its content of the three elements, and its annual cycle of growth and decay. An environmental tracer experiment was carried out in which naturally-occurring fallout radioactivity in the estuary served as the tracer isotopes. In the laboratory, the influence of certain environmental factors on the concentrations of zinc 65 accumulated by an experimental community was tested. Finally, the interactions of radiation, salinity, and temperature on the physiology of the estuarine fish, the mummichog, was observed.

Spartina production was found to approach one-third the total phytoplankton net production of adjacent estuaries and is thus potentially important in estuarine food chains. The unusually high iron content of the dead material suggested that *Spartina* may be especially important in the movement of radioisotopes of iron from water and sediment into estuarine animal populations. Concentrations of gamma-emitting fallout radioisotopes were monitored in *Rangia* over a 30-mile stretch of river and a salinity range of less than 0.1 to greater than 15 parts/thousands. Ruthenium 106 and ruthenium 103 were concentrated more in *Rangia* from downstream stations (salinity range 6-15 parts/thousand), whereas cesium 137 was more abundant in the same species from fresher water (salinity range 0-8 parts/thousand). It was found that a high salinity and zinc concentration suppressed the concentration of zinc 65 in animals and sediment, while high temperature and pH had the opposite effect. In experiments testing the interaction of salinity, temperature, and radiation, it was observed that both salinity and temperature changed the LD-50. Above 20

degrees C. fish were more sensitive to radiation at high salinities, while below 20 degrees C. fish were more sensitive to radiation at low salinities.

SUPPORTED BY U.S. Atomic Energy Commission

5.0806, SEDIMENT MINERALOGY

D.A. WOLFE, U.S. Dept. of Interior, Radiobiological Lab., *Beaufort, North Carolina* 28516

Sediments have the capacity to scavenge many radionuclides from sea water. There is, however, little agreement as to the effect of this phenomenon on the food web of the sea. Will this scavenging action enhance or reduce the uptake of radioactivity by the biota? If organisms have the capacity to utilize the organic matter in sediments as a source of nourishment, sediment-sorbed activity could be passed along the food web to eventually reach man. Conversely, by adsorbing radioactive materials from sea water, sediments could reduce the possibility of contamination in many pelagic animals.

In order to determine the role of sediments in the cycling of radionuclides in the estuarine environment and to gain some insight into sediment-animal relationships, experiments on sediment-sorption of radionuclides are being carried out in the laboratory and in the field. Observations are made on the capacity of natural sediments and selected clay minerals such as montmorillonite, to scavenge radionuclides (zinc-65, cesium-137, and chromium-51) from sea water of varying salinity. Also, the partition of these radionuclides between the sediments, and biota of outdoor ponds will be studied.

5.0807, IMPROVE POLLUTION CONTROL BY REUSE OF PAPER MACHINE PROCESS WATERS

G. WACHTER, Champion Papers Incorporated, *Canton, North Carolina* 28716

This project is directed toward demonstrating the complete reuse of paper-machine process waters by removing these materials as stream pollutants. It is part of a long-term program to develop a method for essentially closed water use systems. The project will include: 1. Recovery of all usable materials from paper-making process waters. This work involves modifications to existing and new systems to increase recovery of paper making materials. Process-water effluent from this system will go to the treatment system. 2. Treatment of excess process water to allow its reuse in place of fresh water, thus greatly reducing the quantity of fresh water required for paper making. Coagulating chemicals and precipitating processes will be used. 3. Disposal of sludge, generated in the treatment process, in a non-pollutional manner. 4. Any excess water flow returning to the stream will be of a quality that it will not contribute to stream pollution.

5.0808, DEVELOPMENT OF FIELD TEST FOR FREE CHLORINE

J.D. JOHNSON, Univ. of North Carolina, School of Public Health, *Chapel Hill, North Carolina* 27514 (DA-49-193-MD-2442)

Tech. Objective - To develop a simple interference free field test to determine concentrations of free chlorine in drinking water.

Approach - Color produced by free chlorine and orthotolidine is stabilized by an anionic surfactant. Reducing agents and complementary tristimulus colorimetry set the level of a simple go, no-go test. Semipermeable membranes are being used to separate chlorine from interferences. An analog membrane disinfection indicator is being studied.

Progress - Mar 66 - Jun 67 - The laboratory procedure for the stabilized neutral orthotolidine short colorimetric methods for determining free chlorine, monochloramine, dichloramine and trichloramine has been finalized. The range of the method has been extended to above 10 mg/L and the number of reagents decreased to two. These reagents were made stable within the

5. WATER QUALITY MANAGEMENT AND PROTECTION

temperature range 5 degrees C to 40 degrees C. The method shows only slight product fading and breakthrough of the chloramines even at high temperature. The accuracy of the short procedure has been evaluated by comparison with ultraviolet spectrophotometry which agrees generally within 1 percent. A preliminary field test procedure is given for use with a color comparator. Field testing and procedure evaluation will be conducted with military personnel in the coming year. The development of an analog membrane disinfection indicator which integrates the effect of concentration, temperature, contact time and PH into a single value result simulating disinfection efficiency is being studied through the evaluation of characteristics of synthetic diffusion membranes. Preliminary ultraviolet spectrophotometric studies have been conducted on the chemistry of bromine and the bromamines for the purpose of determining whether these compounds are suitable alternatives of chlorine for water disinfectants. A new ultraviolet spectrophotometric method for the determination of the total amount of elemental bromine present in solution at any time has been developed using buffered potassium bromine for the formation of tri-bromide ion.

5.0809, MICROBIOLOGY OF ANAEROBIC SLUDGE

R.A. MAH, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

An ecological appraisal of the sludge fermentation is essential to an understanding of the contribution and significance of various physiological types of anaerobic bacteria participating in the degradation of organic compounds to methane and carbon dioxide. This investigation is concerned with an estimation of the total fermentation by whole sludge of certain carbohydrates, fatty acids, and amino acids. The significance of the bacteria which attack these compounds will be evaluated by isolation of pure cultures, estimation of their numbers in sludge, and determinations of their rates of fermentation of specific substrates.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0810, PIGMENT INDICES OF ENVIRONMENTAL OXYGEN STRESS

H.T. ODUM, Univ. of North Carolina, Graduate School, Chapel Hill, North Carolina 27514

In waters of low and fluctuating oxygen tensions, there must be some adaptation in the benthic fauna for obtaining or storing oxygen. Observations of animals in all types of water indicate that a respiratory pigment (in fresh water usually hemoglobin) serves this function. It is the purpose of this project to attempt to classify and quantify the relation between the presence of hemoglobin in benthic animals and the oxygen conditions of the environment.

The accomplish this, animals are sampled from lakes, ponds, and streams, homogenized in a Waring blender, and then centrifuged at 37,000 G's. The absorption spectrum of the supernatant is then read on a spectronic '20.' By knowing the wet weight of the animals homogenized, the concentration of the hemoglobin per gram of animal tissue may be roughly calculated. This value will then be compared with nocturnal oxygen values in the environment.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of North Carolina

5.0811, TRANSPORT MECHANISMS IN WATER FILTRATION

C.R. OMELIA, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

The principal objective of the proposed research is to identify and quantitatively define the mechanisms by which suspended particles are transported to the liquid-filter interface in water filtration. More specifically, the research will attempt to develop a transport model for the filtration process and to test this model experimentally.

Development of the transport model will include the following steps: 1. Describe the force system acting on a single particle. 2. Based on such a force system, develop a differential equation

describing the rate of change of particle concentration in a differential volume of fluid. 3. Consider the flow pattern of these fluid elements past a single collector. 4. From steps (2) and (3), describe the total flux of particles to a spherical collector, and determine the removal efficiency of a single collector.

It is anticipated that experimental testing of the transport model will concentrate on an evaluation of the influence of suspended particle size on the filtration process. Particular emphasis will be placed on defining the critical particle size range within which a minimum transport efficiency exists.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.0812, EXCHANGE OF PHOSPHORUS SPECIES BETWEEN LIVING AND NONLIVING SYSTEMS IN FRESH WATER ENVIRONMENTS

C.M. WEISS, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

Short-term cycling of phosphorus species (Total P, Orthophosphate, Organic-P) will be studied in several fresh water environments. The environments will be a small water supply impoundment, the runoff stream from the impoundment, which in turn receives a treated waste-water discharge and a series of pilot oxidation ponds being used to evaluate their effectiveness for tertiary treatment of the waste water effluent from a biological treatment plant.

In each of these environments the relationship between the several chemical forms of phosphorus will be determined to establish the distribution of the total quantity of this element. High frequency sampling (at least 12 per hour) and analysis will be carried out using automatic analytical devices. A bioassay procedure will be used to determine how and to what extent the several phosphorus forms are available to algae as nutritional elements. Unicellular cultures of several species native to the specific environments will be introduced into water samples freed of particulate matter by membrane filtration. At end of growth period (10 days) residual distribution of P will be determined. Parallel sampling and analyses of Nitrogen states will also be carried out with automatic analyzers.

The variation in type and distribution of the phosphorus species in the exaggerated environment of the oxidation pond will be related to the total biological activity of the ponds.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of North Carolina

5.0813, WATER QUALITY MANAGEMENT OF IMPOUNDMENTS

C.M. WEISS, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

The proposed investigation will establish potential levels of eutrophication in New Hope Lake following completion of New Hope Dam. This will be accomplished by a systematic water quality sampling in the Haw and New Hope rivers which will fill the basin behind the dam. Both rivers now carry a considerable pollution load. Since the proposed lake will undergo thermal stratification, during summer months, with rapid deoxygenation of deep levels, pilot studies will be carried out on University Lake, the near-by water supply reservoir of Chapel Hill, on which ten years of limnological data have been accumulated, to ascertain methods and procedures for destratification by air-lift or mechanical pumping. The information gathered on University Lake will be extrapolated to New Hope. In Phase II, a second three-year period, a suitably scaled-up installation will attempt to improve water quality by destratification of New Hope Lake.

5.0816, QUANTITATIVE AND QUALITATIVE MEASUREMENT OF AQUATIC VEGETATION-CURRITUCK SOUND

T.E. CROWELL, State Wildlife Resources Comm., *Raleigh, North Carolina*

The objective of this job is to determine the amount and distribution of aquatic vegetation in northern Currituck Sound with particular emphasis upon the apparent immediate and long-range effects upon that vegetation resulting from the salinity artificially created in Back Bay by the City of Virginia Beach, Virginia, and draining therefrom into Currituck Sound. Similar effects by sea-water intrusions resulting from natural breaks through the Outer Banks will be determined should such breaks occur.

To accomplish this objective, three samples of aquatic vegetation, each two square feet in area, will be collected with modified oyster tongs at 500-yard intervals across Transect H (Virginia-North Carolina State Line), Transect I (Knotts Island to Bench Marsh), and Transect J (Knotts Island to Swan Island). These samples will be collected quarterly (August, November, February, and May.)

The percentage volume of each species present in each sample will be determined by an ocular estimate and the total volume of aquatic vegetation in each sample will be obtained by displacement following soil removal. Data also will be compiled to provide: total milliliters displaced by each species on a square-foot basis, and the percent frequency of occurrence of each species.

Comparable sampling and data compilation will be effected in the general area of any breaks that may occur naturally through the Outer Banks and result in a sea-water intrusion of significant magnitude.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0817, STATEWIDE FISHERIES RESEARCH

E.H. SHANNON, State Wildlife Resources Comm., *Raleigh, North Carolina*

The objectives of this job are to determine the relative toxicity, constancy, and susceptibility to detoxification possessed by the various commercial rotenone formulations used in fish management and to determine the effects of temperature, water quality, and other pertinent variables upon these factors.

Twenty-four hour TLM bioassays to establish the toxicity of commercial rotenone formulations under various conditions of temperature and water quality are being run at 78 degrees F. using 1-to 2-inch bluegills as test organisms. The individual determinations are being paralleled by similar bioassays to evaluate the speed and efficacy of detoxification by potassium permanganate under the same variables. The rotenone formulations to be tested will include Noxfish, Pro Noxfish, Chem-Fish Regular, Chem-Fish Regular O. F., Chem-Fish Synergized O. F., Chem-Fish Special O. F., Chem-Fish Collector, Chem-Fish T, C-Lamp, and Dri-Noxfish.

These studies will be made at the Commission's Fayetteville Water Quality Laboratory.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0818, STATEWIDE FISHERIES RESEARCH

E.H. SHANNON, State Wildlife Resources Comm., *Raleigh, North Carolina*

The objective of this study are to determine the points at which temperature, both in shock and continuous exposure, adversely affects the development of striped bass eggs and fry.

Fertilized striped bass eggs of common inheritance will be water-hardened, incubated, hatched and the resulting fry retained for five days in constant water temperatures between 60 degrees F. and 85 degrees F. by 5 degrees F. intervals.

Striped bass eggs of common inheritance at the fertilized unwater-hardened stage, at the eyed stage, and approximately five hours prior to hatching will be subjected to temperature shock, by intervals of 5 degrees F. from the 65 degrees F. of incubation upwards to 85 degrees F. and downward to 60 degrees F. Two-day striped bass fry of common inheritance and produced at a constant 65 degrees F. during egg incubation, will be exposed to identical temperature shocks.

Appropriate controls of the same inheritance as the experimental fish will be maintained at a constant 65 degrees F. in all experiments.

Temperature shocks will be induced by changing incoming water temperatures, not by moving eggs or fry.

Effects will be judged by the comparative rates of mortality and/or deformity between the experimental groups and their respective controls.

This work will be done principally at a field laboratory at Weldon, N. C. Mr. Michael L. Bowling will assist with the field operations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

5.0819, WATER UTILIZATION AND WASTE CONTROL IN THE POULTRY PROCESSING INDUSTRY

W.M. CROSSWHITE, Univ. of North Carolina, School of Agriculture, *Raleigh, North Carolina 27600*

The purpose of this study is to evaluate economic alternatives for effective in-plant control of water utilization and discharge of waste from food processing operations. This will encompass a study of the totality of water use from water intake through final waste treatment. Specific objectives are to:

1. Determine the pattern of water use by plant processes.
2. Determine the origin, nature, and quantity of polluting matter for major processes.
3. Evaluate the impact of production methods, changes in technology, product quality requirements, conditioning of water and by-product development on water utilization and pollution.
4. Compare the relative costs of prevention and control of waste within the plant and treatments.
5. Formulate guides for the control of water utilization and pollution abatement in food processing plants.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0820, CHANGES DURING EUTROPHICATION OF AN ESTUARY

D.B. HORTON, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

To measure quantitatively the effects of the pollutants and the ensuing eutrophication on the communities of the plankton, rooted aquatic plants, and the macrobenthos, and to determine the factors that influence the distribution and abundance of the various species. 2. To predict the effects of even greater pollution of this estuary and, if possible, to make suggestions to alleviate the eutrophication. 3. To demonstrate the value of field plot design for understanding the biology of an estuary and for predicting effects of a pollutant. 4. To determine if a measurement of the heterotrophic activity of the planktonic bacteria with radioisotopes is a useful method of indicating the degree of eutrophication and pollution.

5.0821, PHOSPHATE MINING EFFLUENT IN ESTUARINE ECOLOGY

D.B. HORTON, Univ. of North Carolina, Graduate School, Raleigh, North Carolina 27600

As part of a broader program in estuarine ecology we propose here specific experimental studies of the effluent from phosphate mining operations and its effect on selected component species of the biota. Experiments will be on a scale bridging the gap between observational studies on the estuary as a whole and laboratory studies. At our Estuarine Laboratory a series of pools, and artificial estuaries, will be subject to experimental control, but still much more nearly natural than in the laboratory. This experimental facility will use the phosphate mining operations and the effluent settling basins through experiments described here, with measurements of four principal biological parameters; the bottom fauna; the periphyton, the plankton, and the rooted plants. Immediate experimental questions include: 1. What is the biological activity of untreated effluent of the mining operations as measurable upon these selected components of the biota? This integrates with our present investigations of chemical and physical characteristics. 2. What is the effect on biological activity, of suspended clays (principally Montmorillonite)? 3. Why does settling reduce biological activity of the effluent? 4. What is the effect of differing substrates upon biological activity of the effluent? Present investigations suggest that most primary production takes place on the bottom where we may expect the nature of the substrate to govern the effect of chemicals added to the system. 5. What is the biological effect of effluent from a sewage treatment plant on estuarine ecology, both alone and in combination with effluent from phosphate mining?

5.0822, ROLE OF ANIMAL WASTES IN AGRICULTURAL LAND RUNOFF

D.H. HOWELLS, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

The principal project objectives are to (1) investigate the pollutional aspects of agricultural land runoff from confined and unconfined animals growing in well defined small watersheds (2) develop relationships between water quality and environmental factors such as animal pollution and hydrology for application to other areas with similar conditions.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0823, WATER CONTAMINATION BY FERTILIZER NITROGEN AND PHOSPHORUS

J.F. LUTZ, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

The objectives of this project are to determine the direct contribution of fertilizers to nitrogen and phosphorus contamination of surface and subsurface runoff, as affected by: (a) Form of fertilizer applied; (b) Time of application; (c) Rate of application; (d) Crop to which applied; (e) Soil physical and chemical properties; and (f) Meteorological and hydrological conditions. At different times during the period of study, different forms and rates of nitrogen and phosphorus fertilizers will be applied to two completely enclosed watersheds, and to surface runoff plots superimposed on them. Surface losses of nitrogen and phosphorus will be determined by analyzing the soil and water caught in the tanks at the bottom of the runoff plots. Total losses from the watershed will be determined by analyzing the water that passes over the weir at the bottom of the watershed. Soil and plant samples from the watersheds, and water from water wells on the watersheds, will be analyzed.

The two watersheds are on the branch Experiment Station of the North Carolina Agricultural Experiment Station at Waynesville, North Carolina. All analyses will be made in the Analytical Service Laboratory of the Soil Science Department, North Carolina State University, Raleigh, North Carolina.

5.0824, FILTRATION OF KRAFT PULP LIQUOR THROUGH CHIPS

A.J. STUMM, Univ. of North Carolina, Graduate School, Raleigh, North Carolina 27600

The purpose of the project is to investigate the purification of Kraft wash water by utilizing wood chips as a filtering medium. The wash water, containing insufficient pulping chemicals for profitable recovery, will be contacted with wood chips normally kept as inventory stock. In addition to reducing the alkaline pH of the Kraft washwater and adsorbing water soluble chemicals, the wood chips will undergo a mild prepulping action as a result of the contact with the wash water.

5.0825, RELATIONSHIP OF PESTICIDE PROPERTIES TO ADSORPTION

T.M. WARD, Univ. of North Carolina, Graduate School, Raleigh, North Carolina 27600

Investigations are proceeding of various physico-chemical properties of herbicide-like chemicals which can be related to their practical behaviors. These include determinations of: partitioning between polar and non-polar phases, dipole moments, vapor pressures, electrophoretic migration on various substrates, ionic equilibrium constants, keto-enol ratios in various solutions, and degrees of protonation. Models of the organic fraction of soils and of quantitative adsorption on these adsorbents are also under investigation. Factors effecting adsorption include: pH, temperature, and the variation in electronic nature of structurally related molecules. Bonding mechanisms are being investigated by means of IR and NMR techniques. Particular attention is being given to N phenylcarbamates, alkylamino-s-triazines, anilides, and carboxylic acid derivatives.

5.0826, THE DISPOSITION OF PESTICIDES IN THE SOIL

S.B. WEED, Univ. of North Carolina, Agricultural Experiment Sta., Raleigh, North Carolina 27600

OBJECTIVES: A. To determine the distribution of pesticides in selected soils and their drainage waters, using sites to which known amounts of pesticides have been applied. B. To determine the physical, chemical and biological processes, and soil characteristics which are important in the disposition of pesticides in soils.

DESCRIPTION: A Southern regional project in which North Carolina efforts will be directed towards Objective B: Adsorption isotherms will be constructed for organic pesticides on clay minerals. X-ray diffraction and infrared studies will be conducted

5. WATER QUALITY MANAGEMENT AND PROTECTION

to determine orientation and nature of bonding of the adsorbate on the clay. Pesticides used in initial studies will include diquat, prometone, systox, Sevin and parathion.

5.0827, LIFE HISTORY OF THE GOLDEYE (Hiodon alosoides) IN GARRISON RESERVOIR, NORTH DAKOTA

R. HEIB, State Game & Fish Department, Bismarck, North Dakota

Information obtained from gill netting records in Garrison Reservoir indicate that goldeye populations have increased during the past seven years. Presently the Reservoir goldeye population is not being utilized for commercial fishing. There is however, an increasing demand for the goldeye in Canadian markets. A large standing crop coupled with the possibility of a near-by export market indicates that commercial fishing for Goldeye could become a reality.

A knowledge of specific life history in Garrison Reservoir is important to an intelligent exploitation of a species. At the present time little is known about the habits of the goldeye in Garrison Reservoir. The proposed investigation will attempt to complete the following objectives (1) determine the principal spawning areas of the goldeye in the reservoir, (2) estimate the fecundity of the goldeye and length of spawning season and (3) establish the age class composition of the goldeye populations from spawning until late fall.

Procedure: The goldeye is known to be a pelagic spawning fish. Any determination of spawning sites will need to compare the number and age of eggs found within a given area. A Clark-Bumpus plankton net with a suitable sized mesh will be utilized to locate areas of egg concentration. After areas are located they will be sampled regularly during the spawning season. Presently semi-weekly samples are thought to be adequate, but sampling times and effort may be altered by field conditions. Sampling will be concentrated in the Mossit Bay area of the reservoir. Both diurnal and nocturnal sampling will be done.

Goldeyes will be captured by gill nets and frame nets. Specimens taken will be examined for sexual maturity, size, and condition of ovaries. Scale samples will be taken caterized for laboratory analysis. Ovaries will be removed and the number of eggs per female estimated throughout the spawning periods. In addition, determination of water temperature, wave action, turbidity and pH will be measured.

In this first project segment intensive sampling will be carried out from April, 1966 until June 1966. Age distribution studies of the goldeye populations will continue until September 15, 1966. A latin-square gill net will be utilized to capture different age classes in a random manner. Data obtained will be evaluated at the University of North Dakota with the aid of a high speed digital computer.

5.0828, EVALUATION OF METHODS DESIGNED TO PREVENT WINTER-KILL

A. KREIL, State Game & Fish Department, Bismarck, North Dakota

Objectives: To study methods of alleviating winter kill utilizing systems designed for lake circulation.

Procedure: 1. Lake Upsilon, Gravel Lake, Hooker Lake and Dion Lake are described in Job 8, Project F-2-R-1. Lake survey reports and maps of these lakes are on file in North Dakota Game and Fish Department office in Bismarck. 2. The circulation systems employed in this job are described in Job No. 5, Project F-2-R-8. 3. The circulation systems will be installed prior to freeze-up in all project lakes. They will be operated until spring over-turn and then all except those in Hooker Lake will be removed during the summer. The systems will be operated in Hooker Lake during the summer period. At the time of operation of all systems determination will be made of water chemistry, dissolved gas contents, vertical temperature profiles, circulation rates and B.O.D. will be determined during the summer project

period. 4. Lake Upsilon, Hooker Lake and Gravel Lake now contain game fish populations. Dion Lake has been stocked with walleye. Inventories of the fisheries in each project lake will be made. 5. The circulation systems in Lake Upsilon will not be operated during winter of 1968-69. Physical and chemical data will be recorded for this lake without circulation.

5.0829, THE RELATIONSHIP BETWEEN TURBIDITY CURRENTS AND FISH MOVEMENTS IN GARRISON RESERVOIR

S. PETERSON, State Game & Fish Department, Bismarck, North Dakota

Turbidity currents constitute a unique environmental factor in reservoirs. The proposed project is an attempt to correlate turbidity currents and fish movements in Garrison Reservoir.

Procedure: Two sampling stations will be established at the upper end of Garrison Reservoir. Turbidity currents can be more easily measured before the currents spread out into small linear layers over the entire reservoir. Field studies will be centered in the Mossit Bay region.

Gill nets based on a latin square design will be utilized to detect fish movements. It is anticipated that 2 such nets will be needed. Nets will be 18 feet wide and 72 feet long. Panels of 6 different mesh sizes will be built into the net. The panels will be 3 feet square. They will provide a 6 x 6 matrix repeated 4 times. The six mesh sizes utilized will be 3/4', 1 1/4', 1 3/4', 2 1/4', 2 3/4', and 3 3/4'. The design is after that of Houser and Ghent (1964).

When completed the study will provide as accurate correlation between: depth and species captured, depth and size of fishes captured, and turbidity currents and species. Relative abundance of different species will also be determined.

The gill nets will be supported from floats and anchored in or near the main current. Times for running the nets will be established in the field. Initially, a 6-hour sampling period is proposed, but this may be altered by catch size. Sampling will start in June 1966 and continue until September 15, 1966.

Turbidity samples will be collected from a series of weighted closed bottles suspended from one edge of the gill net. The bottles will be opened simultaneously and the suspended solids will be measured. Other water chemistry tests will be made on the samples, depending upon the amount of field equipment available.

When completed the results will provide information that will aid in establishing the location of commercial fishes in relation to turbidity currents.

5.0830, SECONDARY TREATMENT OF HOG WASTE IN AN ANAEROBIC STABILIZATION POND

R.G. BUTLER, North Dakota State University, School of Engineering, Fargo, North Dakota 58102

The object of this study is to evaluate the performance of and to provide parameters for the design of anaerobic ponds receiving effluent from settled hog waste.

This study will be conducted on a stabilization pond located at the Nutrition Center, North Dakota State University. The pond is 20 feet wide by 200 feet long having an average depth of 4.5 feet. A wooden partition separates the pond into two equal units (20' X 100') - the south unit will be used as a control, the experimental work will be done in the north unit. The waste from 80 to 120 hogs will be discharged into a 16,000 gallon septic tank, the effluent will be pumped into the pond.

The investigation will involve three phases which are preliminary, the physical-chemical and the microbiological. In the preliminary phase, potassium concentrations at various depths and location within the pond will determine number of samples and sampling stations.

Standard physical-chemical tests will be conducted on the effluent and on the liquid within the pond during the spring, summer, fall and winter if physically possible.

The microbiological phase will consist of work on total counts, coliform bacteria, photosynthetic bacteria and reducing bacteria.

5.0831, SALINE WATERS AND LIVESTOCK PRODUCTION

W.E. DINUSSON, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

1. To determine maximum and/or optimum tolerances of saline waters for livestock. 2. To evaluate the effect of the various salts and interaction of these salts on tolerances and efficiencies of livestock production.

Proposed to maintain livestock on standard rations and vary the concentration of salts of sodium, potassium, magnesium and calcium (sulfates, carbonates and chlorides) in the available drinking water to ascertain minimum tolerances due to the salinity. Initial work to be with growing fattening swine, later to be expanded to ruminants.

5.0832, QUALITY IMPROVEMENT OF SWIMMING POOL WATERS - KINETICS AND MECHANISMS OF THE CHLORINATION-DEGRADATION OF UREA AND URIC ACID

C.W. FLEETWOOD, North Dakota State University, School of Chemistry, Fargo, North Dakota 58102

The purpose of this study is to determine the fundamental step-by-step chemical reactions that take place in the 'purification' or 'decontamination' of swimming pool and potable waters when they are treated with elemental chlorine or with compounded chlorinating agents.

The kinetics and the mechanism of the chlorination-degradation reaction of urea and of uric acid in aqueous solutions 10⁻³ to 10⁻⁵ moles-per-liter concentration range, at pH values from 4 to 10, will be followed through the various intermediates to the final products of degradation, i.e. CO₂, Na, H₂O, and HCl.

The course of the reaction will be followed by the chlorimetric ortho-tolidine, the phosphomolybdate, the xanthidol, the ultra-violet spectrophotometric, and by the pH versus time methods.

The data thus obtained will be subjected to a careful and detailed mathematical analysis to solve the complicated system of simultaneous and sequential chemical reactions into their individual first and second order stepwise component reactions.

The knowledge obtained will be used to develop better methods for the control of the amounts of chlorine to be added, and for reductions in the amounts of irritant intermediates present at any time.

5.0833, WATER BALANCE IN SEWAGE STABILIZATION LAGOONS

G.O. FOSSUM, North Dakota State University, State Water Resources Inst, Fargo, North Dakota 58102

This project proposes to conduct field investigations and laboratory analysis aimed at determining the water balance for a sewage stabilization pond containing an appreciable loading of organic industrial wastes. It is also intended to trace lateral movement of seepage from lagoons, and its effect on the adjacent water table.

The water balance is to be determined by measuring influent and precipitation by meters and rain gages and comparing with effluent, evaporation, and seepage. Quantity of effluent discharged will be measured and evaporation losses determined from evaporating pans. Infiltrometers will be used to determine seepage from the lagoon bottom.

Observation wells surrounding the lagoon at varying distances are to be used for sampling ground water for laboratory analysis. Correlation with natural ground water in the vicinity will give indications of pollution and ground water travel. These wells will also be used for water table observations.

5.0834, EFFECTS OF SUGAR REFINING LAGOON EFFLUENTS ON BIOLOGICAL, PHYSICAL, AND CHEMICAL PROPERTIES OF FARGO CLAY

B.R. FUNKE, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

The proposed research plan involves use of soil columns and greenhouse experiments to determine the effects of applying sugar refinery lagoon effluents to Fargo clay. The chief objectives of the investigations will be to: 1. Determine any changes in the ability of Fargo clay to allow infiltration of sugar lagoon effluents, for example, slowing due to clogging from biological or other causes. 2. Determine the effectiveness of Fargo clay in eliminating biologically degradable components of these wastes. 3. Determine effect of such wastes on selected chemical properties of Fargo clay. 4. Determine the practicality of cropping soils treated with such lagoon effluents with various types of plants.

The methods to be used would involve application of liquid wastes to soil columns of Fargo clay, both cropped and uncropped, and determining any changes in infiltration rates. Tests would be aimed at correlating any clogging with biological accumulations and physical and chemical changes in the soil. The continuing effectiveness of the soil in purifying the wastes would be determined by testing for changes in Biological Oxygen Demand and Chemical Oxygen Demand. Greenhouse pot experiments would determine effects of waste applications on growth of various plants.

5.0835, FARM ANIMAL WASTE DISPOSAL

G.L. PRATT, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objectives: 1. Characterization of the physical, chemical and biological properties of livestock and poultry wastes. 2. Improvement in management systems with regard to handling, treatment and disposition of wastes.

Description of Work Proposed: A. An evaluation survey will be made of farms in North Dakota using liquid manure handling systems for hogs and poultry. B. The lagoon system of sewage disposal receiving liquid manure from a hog house will be studied in detail including temperature, odor, B.O.D., etc. C. Open pit septic tanks will also be studied.

North Dakota State Government

5.0836, A FEASIBILITY STUDY OF A LIVESTOCK WASTE DISPOSAL INVOLVING REUSE OF WATER

G.L. PRATT, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objectives: (1) To compare and evaluate on the basis of available information the components needed to condition animal waste water for reuse. (2) To assemble pilot treatment systems to evaluate the performance of components in field use.

Description of Work Proposed: The initial phase of the study of the feasibility of reusing water in livestock waste disposal systems will involve a review of the types of components that are available for separating the solids from the liquid; for eliminating undesirable chemical elements; and for neutralizing pathogens. Commercially available components will be investigated. Available information on the quantity of materials that will have to be handled will be summarized. The evaluation of the mechanical performance of selected systems will be made in a pilot disposal assembly. Waste material will be collected from livestock and introduced into the test systems. During part of the laboratory testing, the rate of buildup of undesirable chemical elements in the reused water will be determined. After these rates have been established, the efficiencies of the equipment available for removing these chemical elements will be evaluated. The determination

5. WATER QUALITY MANAGEMENT AND PROTECTION

of the efficiencies of the pathogen neutralizing equipment will be the final stage of the pilot test sequence.

SUPPORTED BY North Dakota State Government

5.0837, MICROBIOLOGY OF SEWAGE LAGOONS - EFFECTS OF INDUSTRIAL WASTES ON COLIFORM AND OTHER ENTERIC ORGANISMS

J.W. VENNES, Univ. of North Dakota, School of Medicine, Grand Forks, North Dakota 58202

The proposed research involves laboratory and field investigations designed to determine the changes in coliform and other enteric organisms in lagoons receiving wastes from starch manufacturing (potato wastes), cheese manufacturing and domestic sewage. All lagoons to be studied will receive, in addition to the starch and cheese manufacturing wastes, domestic wastes.

Laboratory investigations will employ the following methods: 1. Millipore filter counts of coliform, fecal coliform, enterococci and total bacteria. 2. Biological oxygen demand (BOD), pH, total and suspended solids and organic nitrogen.

Field studies will relate: 1. Temperature and loading of the several lagoons. 2. Aeration versus static methods as a treatment device and their relations to enteric and other organisms.

Major emphasis will be placed on the removal of coliform bacteria which indirectly relate to the removal of pathogenic bacteria.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of North Dakota

5.0838, A PILOT FACILITY TO DEMONSTRATE OFF-SHORE, UNDERWATER, TEMPORARY STORAGE OF STORM OVERFLOW FROM A COMBINED SEWER

W.J. BANDY, Karl R. Rohrer & Associates, Akron, Ohio 44311 (14-12-143)

Combined sewer storm overflows are a source of water pollution. The proposed work is to design, construct, and operate a pilot facility to demonstrate off-shore, underwater, temporary storage of storm overflow from a combined sewer. The storage will be accomplished in large flexible (rubber) containers, anchored under water in a water body. The system will automatically fill during a stormy event, and a pump flush system will be used to empty the tanks into the interceptor sewer after storage for treatment at the treatment plant.

The system capacity is designed for a particular site according to climatological, hydrological, and topographic conditions.

The construction site is a 15 acre drainage area located in Sandusky, Ohio. The existing leaping weir overflow structure is at the foot of McEwen Street. The tanks will be installed in Sandusky Bay of Lake Erie. Two flexible tanks will be used, having a capacity of 100,000 gallons each. The 200,000 gallon capacity will completely store overflows from a 1-year storm.

Each tank is approximately 57.5 feet square and will have an 18 inch diameter pipe frame around the periphery. The point of flow entrance and exit is at the center bottom of each tank. One tank shall have a steel bottom and a neoprene-coated nylon top. The other tank shall have neoprene-coated nylon bottom and top. Both tanks will collapse when empty and inflate to a height of seven feet on filling.

Instrumentation will include a recording rain gauge, continuous flow recorders (two remote reading type, one magnetic), an automatic sampling device, and recording devices for tank volume and lake level.

5.0839, OPERATIONAL DEMONSTRATION OF OXIDATION DITCH METHOD OF WASTE TREATMENT

H.M. KANESHIGE, Ohio University, School of Engineering, Athens, Ohio 45701

The project objectives are (1) to determine design criteria for the oxidation ditches based upon experimental and analytical evaluation of a currently available dual plant; (2) to determine most desirable operational procedures for obtaining maximum

performance; and (3) to obtain an effectiveness comparison between the oxidation ditch and the lagoon methods of wastewater treatment.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl Ohio University

5.0840, HIGH RATE TRICKLING FILTERS AND AERATION DEVICES FOR THE ADVANCED BIOLOGICAL TREATMENT OF INTEGRATED KRAFT PULP AND PAPER MILL EFFLUENTS

V.A. MINCH, Mead Corporation, Chillicothe, Ohio 45601

The pulp and paper industry needs to find an alternative treatment process which is less expensive and difficult-to-operate than the conventional activated sludge process. As a step in this direction, this project will involve the continuous operation of a pilot treatment plant containing plastic trickling filter, brush-aerated oxidation ditch, conventional aerated lagoon, deep aerated lagoons, and two clarifiers in combinations and evaluate possible efficiencies.

The specific research objectives are to: determine the effect of influent quality on biological treatment; evaluate potential of plastic trickling filters alone and in combination with brush-aerated oxidation ditch, conventional aerated lagoon and deep aerated lagoon; and to achieve higher-than-conventional BOD removals from kraft mill wastes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl Mead Corporation

5.0841, PROCESS DEVELOPMENT FOR REMOVAL OF NUTRIENT MATERIALS FROM WASTEWATERS

E.F. BARTH, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Develop processes that more efficiently remove nutrient materials such as nitrogen, phosphorus, and sulfur from wastewater effluents; before discharge to receiving water.

Biological populations are controlled by process modifications which enhance desirable reactions. Chemical additives which can simultaneously be used with the biological flora are also investigated.

Nitrogen: Currently nitrification is being controlled by a two-stage biological treatment. Carbon is removed in a high-rate activated sludge system with high sludge wasting; the effluent enters a nitrification stage which contains an enriched culture of nitrifiers. The enriched culture is a result of the nature of the feed, and separate sludge recycle systems in the two-stage process.

Biological denitrification of the nitrified effluent is possible by passing the effluent through an anaerobic system and the addition of methyl alcohol to force use of the nitrate oxygen. Again the enriched culture approach with separate sludge recycle is used in this unit process.

Sulfur: The sulfur cycle is to also be investigated in this integrated process.

Phosphorus: The efficiency of phosphorus removal by biological systems can be increased by adding chemicals that form slightly soluble phosphorus compounds directly to the biological reactor. Several compounds have been investigated and aluminum appears to be the most satisfactory for several reasons. The combination of biological activity with chemical supplements offers more consistent control than the biological system alone.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0842, QUANTITATIVE DETECTION OF SMALL AMOUNTS OF VIRUSES IN LARGE VOLUMES OF WATER

G. BERG, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Viruses of human origin present in waste, natural, and renovated waters are likely to be there only in small amounts, because they can multiply only in susceptible living cells. Since even a single virus particle may be capable of infecting a susceptible host, methods for detection and quantitation of small amounts of viruses in large volumes of water are needed if waters are to be

5. WATER QUALITY MANAGEMENT AND PROTECTION

monitored effectively for the presence of viruses. A membrane filter procedure is currently under study for this purpose.

Poliovirus 1 and echovirus 7 in concentrations of 50-100 PFU/l have been quantitatively recovered on 0.45 micron Millipore membrane filters. Adsorption to filters is best at neutral pH in the presence of salts. Gelman membranes of similar porosity adsorb relatively little virus. Elution of the virus from membranes can be achieved with full strength serum or with 3% beef extract (Difco). However, each lot of elutant differs in its capacity to elute a given virus, and a lot of serum or beef extract that completely elutes one virus, may elute another poorly. Studies continue in an effort to obtain a more uniform and efficient elutant.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0843, DESTRUCTION OF INFECTIOUS VIRAL NUCLEIC ACID BY IODINE

G. BERG, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

It has been reported that iodine destroys viruses by reaction with the protein coat, and that it does not react with viral nucleic acids. Since iodine is used as a water disinfectant, we have undertaken to determine whether viral nucleic acid, imprisoned in an inactivated shell, presents a hazard in disinfected wastewaters and renovated waters.

Poliovirus 1 (Mahoney) has been concentrated by ultracentrifugation. The viral RNA has been extracted with phenol from the intact virus, and purified by precipitation with salt-saturated ethanol. We have shown that the viral RNA is much more resistant to the disinfecting action of iodine than the parent virus from which the RNA was obtained.

A large volume of coxsackievirus A9 has been concentrated by ultracentrifugation, and its RNA will be extracted and tested for sensitivity to iodine.

Poliovirus RNA and coxsackievirus RNA will be tested for sensitivity to other halogens, also.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0844, WATER QUALITY REQUIREMENTS FOR AQUATIC LIFE

W.A. BRUNGS, U.S. Dept. of Interior, Fish Toxicol. Activities, Cincinnati, Ohio 45244

The primary project of the Newtown Field Station of the National Water Quality Laboratory is to help determine the water quality requirements of freshwater fish. This is being investigated in the laboratory by conducting chronic bioassays and relating the toxicant level at which there is no effect on reproduction or growth of fish to acute lethal toxicity data. By conducting a variety of tests with different species and different types of water, we hope to evaluate the use of this method to estimate safe concentrations for toxicants and species by means of acute bioassays. A natural stream study is being initiated to evaluate these laboratory results.

Autopsy methods are also being developed as a tool for investigating pollution-caused fish kills.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0845, CONTROL OF MINERAL CONSTITUENTS IN WASTE WATER BY ELECTRODIALYSIS

C.A. BRUNNER, U.S. Dept. of Interior, R.A. Taft San. Engin. Center, Cincinnati, Ohio 45226

Electrodialysis has been shown to be a technically feasible method for removing a sufficient amount of the inorganic dissolved solids from municipal waste water to restore it to a quality suitable for direct re-use. Although the process will work on biological-treated municipal waste water which still contains refractory organics, membrane fouling is a problem. Membrane fouling results in a decrease in the degree of mineralization during operation. This problem has been found to be due to the growth of microorganisms on the membranes. Disinfection methods are being studied to find one that is practical. Residual organics will be removed by carbon prior to electrodialysis. It is

necessary to determine the economic feasibility of the process by operating a pilot-scale unit at a municipal waste treatment plant for a sufficient time to determine membrane life and operating costs. An electrodialysis stack has been constructed and is being operated for treating 50 gallons per minute of waste water. About 40 percent of the gross inorganic material (total dissolved solids) in the water is being removed. The fraction of the feed being used for concentrating and electrode streams is 0.086 or less. Appropriate pretreatment studies are being conducted. During the operation, the fractional removal of gross inorganics and selectivity of the removal process for various ions is being measured. Pilot work is being performed at Lebanon, Ohio.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0846, DISINFECTION OF RENOVATED WASTEWATER

R.L. BUNCH, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

In some areas the treatment of municipal wastewater for direct reuse is inevitable. Recreational use of renovated wastewater will also increase in areas which lack surface water. Regardless of the use of reclaimed water, the health needs for sewage purification and disinfection must be met at all times.

The primary objective of this project is development of methodology to produce a pathogen-free effluent from waste treatment processes. This process must be economically feasible, yield an effluent free of hazardous toxic components and as far as possible yield an effluent that does not introduce factors undesirable to aquatic environments.

The merits of chlorination, ozonation, ClO₂-process, and any other promising and practical disinfection process will be evaluated in terms of efficiency, economy, practicability and relative freedom from undesirable after-effects.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0847, IDENTIFICATION OF NATURAL AND SYNTHETIC ORGANIC COMPOUNDS IN RAW AND TREATED MUNICIPAL WASTES

R.H. BURTTSCHELL, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

At the present time comparatively little is known of the organic content of domestic waste waters, either raw or treated, except as to a few classes of compounds such as carbohydrates, amino acids, crude lipids, etc. In particular, very little is known of the composition of secondary effluent. Such questions are now assuming importance because of greatly increased interest in the field of 'tertiary treatment' and surface water pollution in general.

The methods of organic separations and identification are directly applicable once suitable samples are available, and the problems unique to the field are those of sampling and purification. It is necessary to recover the organic compounds at trace concentrations and separate the components of interest from comparatively large amounts of accompanying materials, both organic and inorganic.

The most useful concentration methods are liquid-liquid extraction, adsorption on activated carbon, evaporation at reduced pressure, and freezing. The crude extracts are then partially purified by adsorption and partition column chromatography, steam distillation, gel filtration, and changes in solubility characteristics with pH. Final purification and identification are by more sensitive methods such as thin layer, paper, and gas chromatography and various forms of spectrophotometry.

5.0848, REMOVAL OF SUSPENDED SOLIDS AND PHOSPHATE FROM A SECONDARY EFFLUENT BY ALUM COAGULATION AND DUAL MEDIA FILTRATION

J.J. CONVERY, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Clarification of secondary effluents has application in pollution control, direct reuse and as a pretreatment for other tertiary processes such as electrodialysis, reverse osmosis and ion exchange. Alum coagulation, sedimentation and dual media fil-

5. WATER QUALITY MANAGEMENT AND PROTECTION

tration remove essentially all of the suspended solids, phosphorus and BOD associated with the solids from a secondary effluent. The following operating conditions have been found to be optimum: 1. Overflow rate - 700 GPD/FT² 2. Alum Dose - 300 mg/l 3. Filter Media a) Anthracite - 18 in. of 1.4 mm b) Sand - 6 in. of 0.45 mm 4. Filtration Rate - 4 GPM/FT²

A flocculant aid such as activated silica is necessary to increase the strength of the alum floc and prevent the premature breakthrough of turbidity through the filters. A silica concentration of 3 mg/l as SiO₂ is optimum. Filter runs averaged 17 hours for the above operating conditions. Operating costs based on a 10 MGD plant are estimated to be \$0.08/1,000 gal.

5.0849, DISSOLVED INORGANIC REMOVAL--SELECTIVE ION AND ORGANIC REMOVAL BY ION EXCHANGE RESINS

R.A. DOBBS, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

The problems associated with the discharge of nutrients to receiving waters and the incremental build-up of dissolved inorganic salts with each use cycle make it imperative that technology to remove these pollutants be developed and demonstrated. In this area, ion exchange has operational, technical and possibly economic advantages over other processes for demineralization.

In recent years several new types of synthetic resins have been developed, and are commercially available, which are particularly suitable for the removal of selected ions and have the additional capability of sorbing organic matter. Resins, in contrast to activated carbon, can be regenerated in situ by suitable regenerants.

The objective of this study is to develop the use of synthetic ion exchange resins for the selective removal of inorganic ions as well as organic materials. Phase I of the study will include, 1) optimization of flow rates for the exhaustion and regeneration cycles, 2) evaluation of regenerants for imparting selectivity, 3) determination of optimum volume and concentrations of regenerants for imparting 4) performance of the resin after repeated cycles of operation and 5) cost estimates for the process. Phase II will attempt to screen a variety of resins for the above process.

Experimental apparatus consists of multiple 2' glass columns with associated pumps and pressure equipment.

5.0850, ULTIMATE DISPOSAL OF SLUDGES BY SURFACE SPREADING

J.O. EVANS, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Land surface provides low cost dewatering and oxidation of organic sludges with additional benefits from added soil fertility. Certain insoluble mineral wastes such as calcium carbonate and phosphate are compatible with many soils and can also act as fertilizers. Since dewatering of sludges by sedimentation, centrifugation, or filtration is expensive, a study of wet sludge disposal on land surfaces has been initiated. Pipeline transport of sludges and stabilization to prevent nuisance odors will be studied. Distribution programs to minimize pollution from runoff and percolation will be devised. Long term effects of repeated sludge applications to various soil types will be evaluated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0851, SUSPENDED AND COLLOIDAL SOLIDS REMOVAL--FLOCCULATION BY ORGANIC POLYMERS

S.A. HANNAH, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

The need for solids-liquid separation arises at a number of steps in the treatment of wastewater either by chemical or biologic processes. The newly developing organic flocculants represent the best currently available group of chemicals to 1) increase efficiency of solids-liquid separation 2) minimize sludge mass and 3) improve thickening and filtration properties of sludge.

The overall objectives of this study are to 1) investigate the application of new organic flocculants in waste treatment, 2) determine the mechanism of the flocculation by organic polymers and 3) develop methods for the control of dosage to obtain economic use of these relatively expensive compounds.

A wide variety of polymer compounds distinguished as to chemical composition, charge type, charge density and molecular weight will be studied. The polymers will be studied both alone and in conjunction with inorganic hydrolyzing chemicals such as aluminum or iron salts. Variables to be evaluated include polymers, dosages pH, ionic and solids characteristics of wastewater before and after treatment, effects of agitation and mode of addition of polymer. Experimental apparatus and instrumentation used in the study will include: jar test apparatus, miniature sand filters, microelectrophoretic techniques, colloid titration, and streaming current measurement devices.

5.0852, DISSOLVED INORGANIC REMOVAL BIOASSAY OF ALGAL GROWTH POTENTIAL

W.H. IRWIN, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

A major objective of some treatment processes of wastewater is to so reduce the concentration of nitrogen and phosphorus that the medium will no longer support a luxuriant growth of algae. While it is generally thought that phosphorus is the ion that limits growth, there is evidence that other, but unknown ions or compounds may be limiting as well. It is the objective of this study to develop an empirical but standardized biological assay to determine whether an effluent has been sufficiently treated to limit the growth of algae. The approach to the development of this bioassay will consist of culturing various algae species in purified cultures under controlled physical and biochemical conditions. Rate of growth and total population will be monitored by light-scattering techniques. Growth comparisons will be made of algae in the presence of 1) untreated water, 2) water treated by a tertiary process, 3) water intended to receive the effluent and, 4) various mixtures of treated and stream water. The project will consist of three distinct phases: 1) development of laboratory procedure, 2) evaluation of test under field practical usefulness and, 3) demonstration of the wide and general applicability of the test.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0853, QUANTITATIVE DETECTION AND ENUMERATION OF POLLUTION INDICATOR BACTERIA OF WASTE WATERS AND SEWAGE TREATMENT PLANT EFFLUENTS

B.A. KENNER, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

a. Methods to be perfected for the detection and enumeration of the pollution indicator bacteria, total coliforms, fecal coliforms, and the fecal streptococci will all be based on the latest and best available membrane filter methods.

b. The enumeration and quantitation of *Salmonella* species and *Shigella* species consists of a study of membrane filter and multiple tube methods to detect all pathogenic species present in waste waters and sewage treatment plant effluents. The methods thus far developed consist of (1) enrichment of membrane-filtered bacteria (on a variety of new media and on an established medium) on filter pads soaked with selective enrichment medium, incubated at 41 - 42 C. followed by (2) transfer of the membrane to a secondary medium for obtaining a differential colonial appearance of the pathogen for enumeration and picking to other media for identification. Counts on domestic sewage of *Salmonella* species have been obtained from as low as 9 to 18,000 per 100 ml. Laboratory cultures are not used in these studies, and all developmental work is based on naturally occurring *Salmonella* in the polluted waters tested. Three methods for the enumeration and isolation of the pathogen *Pseudomonas aeruginosa*, which is of increasing importance due to antibiotic resistance are being evaluated.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0854, SUSPENDED AND COLLOIDAL SOLIDS REMOVAL-SOLIDS SEPARATION BY CHEMICAL TREATMENT AND FILTRATION

J.F. KREISSL, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

The separation of suspended solids, either those existing or created by chemical and biological treatment, from waste effluents is a recurring step in the series of processes for advanced methods of treating wastewaters. Plain sedimentation followed by surface or depth filtration have proved to be insufficient for the production of the high quality of effluents required for membrane or adsorption processes. Chemical treatment to obtain coagulation and flocculation followed by filtration appears to be the most promising approach for the complete clarification of wastewaters.

The overall objectives of this investigation is to develop a clarification process which will encompass the following 1) coagulation-flocculation in an upflow-solids contact clarifier, 2) filtration using depth filters such as sand, sand and coal or other media combinations.

The experimental apparatus will consist of a series of specially designed columns, approximately 1 foot square, in which the functions of coagulation-flocculation and rough sedimentation can be accomplished. Effluent from these treatment devices will be filtered in a variety of filter media columns. Some of the experimental variables will include 1) upflow velocity, sludge blanket depth, type of coagulant, coagulant dosage, mixing conditions, time of coagulation or flocculation, filter media and rate, etc. Performance of the process will be assessed by measuring such parameters as turbidity, coagulant ion, head loss, etc.

5.0855, REMOVAL OF NITROGEN COMPOUNDS FROM MUNICIPAL WASTEWATER

A.N. MASSE, U.S. Dept. of Interior, R.A. Taft San. Engin. Center, Cincinnati, Ohio 45226

A novel biological treatment process for reducing BOD and nitrogen content of a municipal wastewater is being investigated in a 100 gallons per day pilot plant at the Mill Creek Sewage Works, Cincinnati, Ohio. Primary effluent is treated by the contact stabilization process using abbreviated residence times for both contact and sludge reactivation. The product from this process is then nitrified aerobically in a separate aeration tank settler combination. The nitrifying sludge is kept in this system. The nitrified effluent flows to an anaerobic, mechanically-agitated denitrifying unit followed by a final settler. The source of organic material to the denitrifying bacteria is sludge from the contact stabilization operation. This sludge has a high BOD/NH₃-N ratio, thus decreasing the amount of NH₃-N put in the denitrifying section. The sludge from the denitrifying settler is returned to the sludge reactivation tank of the contact stabilization process. Parameters being investigated include residence times and sludge recirculation rates.

5.0856, USE OF GRANULAR ACTIVATED CARBON IN TREATMENT OF WASTE WATERS

A.N. MASSE, U.S. Dept. of Interior, R.A. Taft San. Engin. Center, Cincinnati, Ohio 45226

Granular activated carbon is being investigated as an adsorbent for the non-biodegradable materials in a well-treated municipal secondary effluent. A 300,000 gallons per day plant has been on-stream since May, 1965, at Pomona, California. Four down-flow carbon contractors, connected in series, act as both a filter and an adsorbent bed. When the final product quality exceeds specifications, the first column in the series is regenerated in a 6-hearth furnace and returned to the process as the last column in the series. Parameters being investigated include: a) relationship between contact time and removal of contaminants, b) carbon usage rate, c) effect of regeneration conditions on recovery of carbon capacity and d) attrition losses as a result of carbon handling and regeneration. Side studies on a smaller scale

include studies of: a) effect of contact time and mass velocity on adsorption rates and effectiveness, b) nitrogen removal capabilities of carbon columns and c) effect of hot water and steam treatment on regeneration frequency.

Ultraviolet absorption at 2537 Angstrom units of carbon-treated water is being investigated as a rapid control method for the evaluation of carbon column performance. A high correlation exists between UV absorption and organic matter in clarified water. The hydrogen flame detector is being adapted to determine organic matter at levels below 1 mg/l.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0857, POWDERED CARBON TREATMENT OF WASTE-WATER

A.N. MASSE, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Evaluate a two-stage, counter current pilot plant contacting system for powdered carbon treatment of primary and secondary wastewater effluents. Required amounts of powdered carbon and polymer must be determined as well as the standard design and economic criteria.

With a flow rate of 10 gpm (total residence time in the system of 2.7 hours) secondary effluent to which is added 200 ppm powdered carbon and 1.5 mg/l of organic polyelectrolyte, the total organic carbon removed has averaged 90%. When the influent turbidity can be maintained below 20 J.U., the product turbidity is less than 1 J.U.

When feeding primary effluent at 5 gpm to the system and adding 200 ppm carbon and 3 ppm polyelectrolyte, the total organic carbon reduction has averaged between 85 and 91%. The product turbidity is between 1 and 3 Jackson Units. In all runs on primary effluent, the product quality, as measured by total organic carbon and turbidity, has been better than that produced by the activated sludge process.

Evaluate several powdered carbon regeneration methods in conjunction with the powdered carbon process. Regeneration methods to be tested include: (1) microwave heating, (2) reaction furnace, and (3) fluidized-bed techniques.

5.0858, LIME SLUDGE RECOVERY AND REUSE

M.C. MULBARGER, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Lime in doses of 200 to 500 mg/l as Ca(OH)₂ removes phosphates and suspended matter from secondary effluents. The resultant sludge consists of calcium carbonates and phosphates together with silicate minerals, magnesium hydroxide and organic matter. The lime values may be recovered by recalcining the dried sludge. Although the recovered lime may cost nearly as much as fresh lime, the problem of disposing of large volumes of sludge is solved. Waters differing in hardness and phosphate content have been treated through four cycles and the quantity and quality of the recovered lime has been measured. In soft waters calcium phosphate builds up until it represents over half of the weight of calcined lime without exerting any deleterious effect provided that fresh lime is added to make up the losses. In hard waters calcium carbonate is removed from the water and must be continuously wasted along with low concentrations of calcium phosphate.

5.0859, PHYCOVIRUSES - THEIR NATURE, OCCURRENCE, AND APPLICATION

R.S. SAFFERMAN, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Viruses have gained increasing acceptance as a promising approach to pest control. Under favorable conditions these viruses provide a valuable alternative to chemical treatment. The discovery of viruses capable of destroying certain freshwater algae may offer such an approach to the selective control of objectionable algal growths.

5. WATER QUALITY MANAGEMENT AND PROTECTION

We have found that waste stabilization ponds provide a highly fertile source of phycoviruses which suggests that these agents may play a role in inducing natural fluctuations and dominance in algal populations. In some ponds, they represent an established population.

Preliminary laboratory tests on these phycoviruses have shown their possible application in controlling algal blooms. Efforts will be made to elaborate on their ecological significance and to isolate other phycoviruses since practicality of this biological control method is dependent on an intensified screening program that could eventually establish an extensive collection of these viruses.

5.0860, DISSOLVED REFRACTORY ORGANIC REMOVAL -- CARBON AS AN ADSORBENT AND FILTER MEDIUM

W.A. SCHWARTZ, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Removal of non-biodegradable organic compounds from wastewater represents an important unit process in the treatment train to obtain a product water useful for a variety of purposes. The single most promising process is adsorption on activated carbon. The objective of this study is to develop a process for removal of organic materials from wastewater by using activated carbon. In addition to adsorption the carbon also lends itself to use as a filter medium in conjunction with other media such as sand.

Primary and secondary treated waste effluents will be subjected to a treatment sequence consisting of coagulation, filtration and activated carbon adsorption. These pretreatments to adsorption will be varied or omitted to provide a variety of influents for the adsorption step. Hydraulic loadings and carbon bed characteristics will constitute additional variables in the study.

Experimental apparatus will consist of 4' plastic columns. Performance will be judged on the basis of removal of organic matter and turbidity as well as head-loss measurements. The experimental equipment will be located at the Lebanon experimental facility.

5.0861, ENGINEERING ANALYSIS OF WASTE TREATMENT

R. SMITH, U.S. Dept. of Interior, R.A. Taft San. Engin. Center, Cincinnati, Ohio 45226

Mathematical models have been developed to describe both the performance and cost for all of the conventional water renovation processes. The goal of this work is to optimize a system of water renovation processes to meet any specific need for water treatment at minimum cost. Computation is accomplished with digital computer.

Models for the advanced processes such as carbon adsorption and electrodialysis are being developed and will be combined with the models for conventional processes to study water reuse systems. Much information is still lacking, however, for the advanced processes. A secondary goal of the work is to lend continuity and guidance to the experimental programs underway in the Federal Water Pollution Control Administration. Work is also underway to improve the quality of the capital and operating cost relationships now being used.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0862, A STUDY OF THE KINETICS OF THE ACTIVATED SLUDGE PROCESS

K. SMITH, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

Study the kinetic or time dependent performance of the activated sludge process for the purpose of finding practicable methods for automatic control of the process to minimize the variation of water quality in the effluent stream and to improve the average performance of the process. A mathematical model for the activated sludge process has been developed which com-

putes the process performance as a function of time when the influent stream or the operating decisions or both vary with time. One digital computer program has been completed which simulates the time dependent behavior of the activated sludge process. This computation which is a numerical integration utilizing the Runge-Kutta fourth-order method integrates the Monod differential equations which express the growth of three classes of bacteria: Heterotrophic carbon users, Nitrosomonas which converts ammonia to nitrite, and Nitrobacter which converts nitrite to nitrate.

The aerator is sub-divided into ten sub-volumes, any number of which can be used to simulate mixing, and a sludge storage tank is provided in the sludge return line. A surge tank, in which no biological activity is assumed, is also provided upstream of the aerator. Sinusoidally varying flow and BOD concentration are applied to this system and the concentration of three classes of microorganisms and three substrates as well as flow are computed as a function of time at each of seventeen stations. Various control schemes involving pumping of sludge from the sludge storage tank to minimize the effect of the varying load on the plant or the use of the surge tank to smooth out the flow have been studied.

The ultimate goal of the time dependent model is to study methods for control of the activated sludge process to give optimum performance when the flow and BOD concentration entering the plant varies throughout the day.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0863, DEVELOPMENT OF AUTOMATED ANALYSES FOR THE SUPPORT OF ADVANCED WASTE TREATMENT RESEARCH PROJECTS

R.T. WILLIAMS, U.S. Dept. of Interior, Water Research Laboratory, Cincinnati, Ohio 45226

The effective evaluation of water treatment research is dependent upon obtaining accurate data concerning the constituents found in the waters and waste waters. The automation of analyses is the obvious means of coping with the increasing need for chemical analyses. The use of automation can increase an analyst's daily output manifold and yet retain the necessary precision and accuracy.

This project is concerned with developing, modifying, or adapting water pollution analysis procedures for use with automated instrumentation. These procedures are represented by the sulfate, total phosphate, organic nitrogen, and others. Some of these procedures have been previously automated but are insufficiently accurate or are not applicable to wastewaters. Hence the need for development work in this area.

Ideally, the procedures will be completely automated and standardized so that all types of samples can be treated identically throughout. However, in some instances pretreatment of the samples may be necessary.

The use of automated instrumentation for the analysis of wastewaters can substantially increase the analytical laboratory's effectiveness in supporting wastewater treatment research.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0864, TREATMENT OF BEAN HOUSE WASTES FROM A VEGETABLE TANNERY

J.D. EYE, Univ. of Cincinnati, School of Engineering, Cincinnati, Ohio 45221

The objectives of the project are to demonstrate the feasibility of treating bean house wastes from a tannery and to obtain basic data for the design of full scale treatment plants. Excess lime from the lime bearing wastes will be removed with polyelectrolytes. The clarified lime wastes will be mixed with non-lime bearing wastes and neutralized with acid to a pH of 8.5 - 9.0. The organic material in the blended neutralized wastes will be reduced by a combined anaerobic-aerobic biological system.

5.0865, FISH OPERCULAR RESPONSE TO ENVIRONMENTAL VARIABLES

W.A. SPOOR, Univ. of Cincinnati, Graduate School, Cincinnati, Ohio 45221

To define water quality favorable for aquatic organisms it is necessary to know for each environmental component the range over which its concentration or intensity may vary without adverse effects, and how any one component is related to the rest within their permissible ranges, not only directly, but also indirectly through their effects on the organisms. Relatively little of the literature on the effects of various agents on aquatic life is germane to water quality criteria at present; the major deficiencies are (1) the tests have been acute, with endpoints (usually death) too crude to be relevant to life history and productivity, (2) the effects of combinations of environmental components have received relatively little attention, (3) few species have been tested extensively, and (4) even few have been studied at more than one or two stages of the life cycle. My research objectives are to help correct these deficiencies by using opercular movements* to detect and measure a fish's responses to changes in dissolved oxygen concentration, carbon dioxide and temperature varied alone and in combination. These three will be studied first because of their primary importance. The goldfish and the fathead minnow will be tested to begin with, the former because of its relatively slow opercular movements and because of the numerous papers on goldfish, the latter because it may be possible to relate short-term tests on opercular rate to long-term tests on life-history now being conducted at the Fish Toxicology Laboratory at Newton, Ohio. The study will include, also, an attempt to develop an improved method for measuring free carbon dioxide in water.

*The sensitivity and utility of the opercular response have been known for many years, but until recently technical problems have discouraged its use. Now that the frequency (and probably the amplitude) can be detected and recorded electrically without disturbing or damaging the fish, the technical problems seem to have been solved.

5.0866, WASTE TREATMENT FACILITIES FOR POLY VINYL CHLORIDE MANUFACTURING PLANT

A.R. SMITH, B.F. Goodrich Company, Cleveland, Ohio 44115

A development, demonstration, and evaluation project for the bio-chemical treatment of wastewaters from a typical poly vinyl chloride manufacturing plant, at a 0.85 mgd scale of operation.

The treatment system is to produce effluent to meet the receiving water standards (Delaware River) of greater than 87% removal of BOD, turbidity of not greater than 30 units above river water, and be free from taste and odor producing substances.

The process will consist of chemical pre-treatment with primary sedimentation, followed by activated sludge secondary treatment and a final polishing pond. Tertiary treatment studies with activated carbon are also contemplated to determine the extent to which the secondary effluent will lend itself to tertiary treatment as future Delaware River standards may require the equivalent of tertiary treatment.

5.0867, A PROGRAM FOR DEMONSTRATING COMBINED SEWER OVERFLOW CONTROL TECHNIQUE FOR WATER QUALITY IMPROVEMENTS AND BEACH PROTECTION

R.A. ROTH, Cleveland Bur. of Ind. Wastes, Cleveland, Ohio 44118

This proposed demonstration project constitutes a unique experimental attempt to: reduce the quantity of combined sewer overflow discharges by (1) the introduction of polyelectrolytes into the sewers during periods of rain to increase the flow and (2)

by periodically flushing the sewers during dry weather to reduce the accumulation of solids and organic matter; to disinfect the overflow and polluted stream waters by various methods of storage, feeding and application of sodium hypochlorite solution; to screen debris and floating solids from overflows; to create barriers for reducing the degree of mixing and contamination of shoreline waters by combined sewer overflow discharges; to control bacterial quality of water within these enclosures by (1) pumping water from 2,800 feet offshore, chlorinating, and discharging to the enclosure, (2) hand chlorinating from a boat, and (3) by displacing the water with potable water. The various methods, chemicals, and equipment used for carrying out the foregoing program will be evaluated.

The demonstration project is regarded as an experimental, interim program intended to provide improved water quality at the Lake Erie shoreline until permanent pollution abatement programs can be carried out. It is expected that the information gained from this project could be applied in many locations throughout the country where combined sewer overflows have a polluting effect upon receiving waters.

5.0873, MODIFICATION OF WHITTIER STREET STORM STANDBY TANKS

C.T. LINDBLOOM, Columbus City Government, Columbus, Ohio

This project consists of an evaluation of the pollution reduction effectiveness of storm overflow tanks modernized by installation of automated sluice gates and other equipment.

Physical features of the project consist of the renovation of three existing combined sewer overflow tanks having a capacity of 1.3 mg each. The renovation includes automatic controls for the tank influent sluice gates, new traveling bridge type sludge collectors and new pumps. One objective of the automation is to keep sludge levels by continuously removing it from the tanks and thereby preventing anaerobic decomposition and its resultant odors. Another objective is to control flows at the treatment plant by proper use of the automatically operated sluice gates. The improvements in tank efficiencies are expected to reduce bacterial contamination of the receiving stream, the Scioto River.

Evaluation will include studies of the efficiency of the tanks as treatment units as well as studies of the effect of the system on the river.

5.0874, RELATIONSHIPS BETWEEN PHOSPHATE AND OTHER CHEMICALS AT THE WATERSUBSTRATE INTERFACE IN WESTERN LAKE ERIE

N.W. BRITT, Ohio State University, Graduate School, Columbus, Ohio 43210

This project is designed to determine the chemical and physical relationships between the water and sediment in western Lake Erie. Little is known about the seasonal or longterm changes which have occurred or are occurring at various depths in the sediment and the overlying water. The specific areas of investigation include chemical determinations of the total phosphate, organic content, iron, sulfate, and arsenic content of the sediment and overlying water throughout the year.

Determination of the physical composition of the sediment may give an indication of the rate and amount of siltation. Redox potential and pH determinations should give an indication of some of the chemical changes occurring in the sediments and overlying water.

5.0875, A STUDY OF BIOLOGICAL SYSTEMS IN THE SCIOTO RIVER AS INDICES TO WATER QUALITY

J.H. OLIVE, Ohio State University, Graduate School, Columbus, Ohio 43210

The proposed research plan involves laboratory and field investigations directed toward developing biological indices to water quality conditions in the Scioto River (Ohio) basin and their application to other stream systems. A biological systems analysis approach is planned in which populations of representative organisms and communities of organisms will be intensively studied in relation to physical and chemical parameters. Species diversity indices will be developed and correlated with physical and chemical parameters.

Field investigations will involve: (1) Establishment of study stations in the Scioto River above and below present and anticipated zones of water quality influence. (2) Collection at two-week to four-week intervals of biological organisms in representative habitats. (3) Collection of water and soil samples at locations described in (2).

Laboratory investigations will include: (1) Laboratory identifications of organisms by taxonomic specialists and quantification of results. Correlations between biological organisms and physical and chemical parameters will be determined. (2) Laboratory determinations of trace elements by emission spectroscopy. (3) Species diversity indices will be derived by formulas developed by Patten (1962). (4) Field determinations of chemical conditions for alkalinity, dissolved oxygen, carbon dioxide, chlorides, iron, nitrates, phosphates, silicates, and sulfates.

5.0876, THE CYCLING OF C1-36 LABELED DDT IN NATURAL ECOSYSTEMS

T.J. PETERLE, Ohio State University, Graduate School, Columbus, Ohio 43210 (AT(11-1)1358)

The universal contamination of our environment by persistent chlorinated hydrocarbons is an established fact. Samples from the Arctic, from the pelagic fishes of the Pacific Ocean and from the fauna of the Antarctic have been positive for residues of DDT metabolites. Additional biological research has demonstrated that physiological and behavioral effects on certain organisms can be demonstrated in the laboratory at extremely low levels of exposure. The importance of environmental levels of pesticide residues, their translocation and bioaccumulation in natural systems, is self-evident. The production and distribution of DDT continues to increase, not only in the USA, but on a global scale. The rapid increase in human population density, the demand for increased food production and the more efficient control of insect disease vectors suggests the continued widespread use of pesticidal compounds. Additional information is necessary to ascertain their effect on natural environments.

Prior experience in the use of isotope-labeled pesticides has demonstrated that this is a useful and economical way for determining the transfer of these organic compounds in ecosystems. This project will attempt to determine the transfer of C1-36 DDT through a terrestrial system. Radioassay procedures will be used to quantify the level of the insecticide and its metabolites in the various physical and biological components of the ecosystem. Since the radioassay procedures will assess only the labeled DDT applied, total body burdens will reflect only that DDT accumulated from the study area. Some artificial exposures in time and space will be made to determine rates of accumulation for the various species present on the treated area.

5.0877, INFLUENCE OF SUSPENDED MICROSCOPIC SUBSTANCES ON THE METABOLISM OF MICROORGAN-

5. WATER QUALITY MANAGEMENT AND PROTECTION

ISMS RESPONSIBLE FOR BIOLOGICAL ENRICHMENT OF WATER

R.M. PFISTER, Ohio State University, Graduate School, Columbus, Ohio 43210

The proposed investigation is to study the interaction of environmental contaminants (defined as substance not formed biologically or naturally, and which are not normally indigenous to the water) on the microbial portion of the ecosystem. The particulate materials (detritus) will be examined on a physical, chemical, and biological basis, and the materials will be characterized using differential and gradient centrifugation in conjunction with electron microscopy. The characteristic fractions of suspended particulate material will ultimately be examined for ability to influence biological reactions. This particulate fraction of water is important to microbial relationships in the area of interfaces and biological activity. It is known that particles and molecules in solution accumulate at interfaces (this includes chemicals which can either act favorably (e.g., nutrients) or unfavorably (e.g., pesticides) to organisms) and that enzymatic reactions are concentrated at membranous surfaces. Therefore, it is of significant importance to study the capabilities of non-biologicals that commonly end up in the waters on such colloidal or molecular interfacial systems.

The investigation will be confined to a small river or creek basin which enters into Lake Erie, and to the lake itself.

5.0878, REMOVAL OF TRACE METALS FROM WATER BY ION FLOTATION

A.J. RUBIN, Ohio State University, Water Resources Center, Columbus, Ohio 43210

Contamination of domestic and industrial water supplied by trace metals is of increasing concern. The possible economic damage and potential health hazards of certain trace metals coupled with the difficulty in their removal requires a new approach in treatment process selection and design. Ion flotation, a new low gas flow -rate foam separation technique, offers promise as an effective unit process for the selective removal of such trace metals.

The general objectives of this research are to (1) investigate the variables affecting metal ion removal by ion flotation, and (2) establish design criteria for an ion flotation process. For the first year of the proposed research, the specific objectives are to study the kinetics and variables affecting the removal of lead (II) in batch ion flotation systems. Other cations will be investigated during the second year, and as time permits during the first year after completion of the lead (II) studies. These variables, which affect the rate and/or degree of removal, include the metal ion and collector surfactant concentrations, gas flow-rate, pH, and ionic strength. Interactions between variables will also be determined.

5.0879, RELATIONSHIP OF ACTIVATED SLUDGE BULKING TO ORGANIC LOADING, OXYGEN AVAILABILITY, AND HYDRAULIC CHARACTERISTICS OF THE AERATION TANK

K.S. SHUMATE, Ohio State University, Water Resources Center, Columbus, Ohio 43210

The specific objectives of this research are to investigate the interrelationships between oxygen availability, organic loading, agitation intensity, and mixed liquor age distribution as factors contributing to sludge bulking in the activated sludge process. A physical simulation of the complete mix reactor-in-series model will be used to provide controlled variation of mixed liquor age distribution. Agitation in the aeration tanks will be controlled by the combined use of diffused air and mechanical stirring. Diffusor air flow rate will be varied as required, and the mechanical stirrers will be adjusted to control the total power input per unit volume, which will be used as the parameter of agitation intensity.

5.0880, STUDY OF THE SULFIDE-TO-SULFATE REACTION MECHANISM

E.E. SMITH, Ohio State University, School of Engineering, Columbus, Ohio 43210

Objectives of this study are to determine the effects of timber harvest practices on the physical and chemical characteristics of coastal streams and on fixation of energy by stream periphyton and inflow of organic detritus. Mean levels and variabilities of suspended sediment discharge, stream temperature, net solar radiation, chemical water quality, primary production by periphyton, and inflow of plant detritus will be established during a two year pre-logging period 1966-68. Studies will continue during logging in 1966 and for two years after harvest.

5.0883, CLADOPHORA AS RELATED TO POLLUTION IN WESTERN LAKE ERIE

C.E. TAFT, Ohio State University, Graduate School, Columbus, Ohio 43210

The proposed research involves mapping and quantitative studies of attached Cladophora along the shorelines and on shoals adjacent to the Lake Erie Islands, and of the detached Cladophora beds that drift across the lake bottom. The approach will determine the quantity of Cladophora on the basis of dry weight, its periodicity, the chemical composition relative to that of the lake water, and the relationship of Cladophora to oxygen concentrations over the beds. Studies to evaluate harvested Cladophora as special products such as fibrous filter material, food, and/or as a mulch will be initiated.

Field investigations include: 1) Aerial mapping of Cladophora beds. 2) Observations of periodic growth on the beds. 3) Quantitative measurements of Cladophora on attached and drifting beds. Laboratory investigations include: 1) Chemical analyses of Cladophora. 2) Chemical analysis of lake water. 3) Culture of Cladophora. 4) Suitability of Cladophora as a special filter medium. 5) Suitability of Cladophora as an animal food supplement. 6) Suitability of Cladophora as a speciality mulch.

5.0884, DEVELOPMENT OF TILLAGE-REPLACING HERBICIDE SYSTEMS

G.B. TRIPLETT, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Objective: To develop herbicide systems for non-tilled crop production that control unwanted vegetation and minimize hazards: (1) to current crop, (2) to succeeding crops, (3) of soil and water contamination.

Herbicides will be screened to determine their value in controlling unwanted vegetation and their hazard of crop injury. Promising materials and combinations of materials noted in screening trials will be evaluated for their adaptability to non-tilled crop production following sod and clean tilled crops. The best systems emerging from this research will be evaluated for (1) contamination of crops, (2) injury to following crops, (3) contamination of surface water runoffs.

5.0885, THE EFFECT OF DIELDRIN ON SURVIVAL AND DEVELOPMENT OF FISH EGGS

R.A. TUBB, Ohio State University, Graduate School, Columbus, Ohio 43210

Dieldrin is the most commonly found insecticide in the major river basins of the United States (Breidenbach, 1967). Over 1.5 million acres in Ohio are treated annually with aldrin which is rapidly oxidized to dieldrin. Natural populations of fishes and fish eggs have been surveyed for dieldrin residues. Currently eggs from *Stizostedion vitreum*, *Ictalurus punctatus* and *Polydictus olivaris* are being subjected to concentrations of 0.05 ppb to 125 ppb dieldrin. The project was started in 1966 and will be completed in 1969.

Ohio State University

5.0886, THE UPTAKE OF DIELDRIN IN THE THREE RIDGED NAIAD, AMBLEMA PLICATA

R.A. TUBB, Ohio State University, Graduate School, Columbus, Ohio 43210

Amblyma plicata occurs throughout the Ohio River drainage and is becoming increasingly important for export in the cultured pearl industry. Since this mollusk remains stationary for long periods of time, it can act as a pesticide monitor in streams. Recent studies have shown that naiads concentrate chlorinated hydrocarbons. This study is an attempt to find the levels of dieldrin in natural populations and experimentally determine the uptake and excretion rates of the pesticide. The project was started in June, 1968 and will be completed in 1969.

5.0887, ALTERNATIVE ECONOMIC RESPONSES TO THE ACID MINE DRAINAGE PROBLEM IN SOUTHEASTERN OHIO

R.A. TYBOUT, Ohio State University, Graduate School, Columbus, Ohio 43210

A cost-benefit analysis from which additional inferences are drawn on selected levels of abatement. Costs are found in three parts: (1) costs of treatment; (2) costs of sealing; and (3) secondary costs. Costs of treating mine drainage, in terms of unit acid and iron content are derived from Pennsylvania's 'Operation Yellowboy'. Costs of sealing are based on the results of Moraine State Park Reclamation Project No. 1 (Butler County, Pa.), where 81 mines are currently being sealed. Secondary costs are those derived from unemployment and community loss of income resulting from inability to sell coal at prices that cover treatment costs.

A number of special studies were conducted preliminary to the above. First, employment, wage, price and production series were constructed county-by-county in an attempt to separate

from other trends the unique effects of treatment costs on employment. Second, for the purpose of generalizing the costs to the states, the problem of predicting mine drainage was analyzed on the basis of (1) volume of drainage per ton of coal mined, by county, with subcases for deep and strip mining and with corrections for seam thickness and hydrologic conditions; (2) quality of drainage as affected by surrounding geological strata.

Benefits are found for (1) municipal water treatment; (2) industrial water usage and (3) recreation. Secondary benefits in the form of community impact of tourist expenditures are included. Conceptual limitations to the use of secondary costs and benefits are noted.

5.0888, STRIP-MINING AND WATER QUALITY

J.P. VIMMERSTEDT, Ohio State University, School of Agriculture, Columbus, Ohio 43210

Since 1965 when strip mining began on Little Mill Creek Water Shed, weekly samples of storm water have been taken at four sampling points. Two of the points are receiving effluent from the strip mining operation and two are not. The water samples have been analyzed for concentration of manganese, iron, aluminum, sulfate, calcium, and magnesium. These chemical analyses have shown large differences in composition between those sampling points receiving strip mine drainage and those unaffected by these mining operations. Manganese and sulfate concentrations have shown the largest increases.

A sprinkling infiltrometer has been constructed and is being used to measure rate of rainfall in filtration on spoil banks of varied composition.

5.0889, STRIP-MINING AND WATER QUALITY

J.P. VIMMERSTEDT, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Objectives: 1. To determine the changes in chemical composition of the water in Little Mill Creek following strip-mining for coal on the watershed. 2. To study the relationships between reclamation measures and water quality.

Description of work proposed: Periodic water samples taken at 4 weirs will be analyzed for chemical composition. Three of the weirs receive water from the mined area while one does not. Comparisons will be made between water from the mined and unmined area.

A portable rainfall simulator will be used to study runoff and erosion from the spoil banks, and infiltration of water into the banks.

SUPPORTED BY Ohio State Government

5.0890, HYDROLOGIC INFLUENCES OF STRIP MINING, BEAVER CREEK, KENTUCKY

R.J. PICKERING, U.S. Dept. of Interior, Water Resources Division, Columbus, Ohio

The purpose of this study is to determine the effect of strip mining for coal on the soil, water, and other natural resources. The main study area consists of two small stream basins in the headwaters of Beaver Creek tributary to Cumberland River in McCreary County, Kentucky. The study area includes one watershed in a natural state and the adjacent watershed which has been extensively strip mined.

Strip mining is a common operation in large areas of Kentucky and adjacent states. It is important to all phases of water development in the Appalachia Region to know the effects of strip-mining on the hydrologic system. This study is designed to determine both the nature and the magnitude of the effects.

5.0893, TROPHIC TYPOLOGY OF OHIO LAKES

G.D. COOKE, Kent State University, Graduate School, Kent, Ohio 44240

On the basis of the number and kinds of species, nutrient content, biomass, chlorophyll, and rate of community photosynthesis, lakes are classified as oligotrophic, mesotrophic, and eutrophic. A central question in aquatic ecology is whether the eutrophic type has the properties of a mature or an immature ecosystem. The purpose of this investigation is to classify a group of lakes and reservoirs in Ohio on the above bases, and to then approach the question of the degree of maturity of a nutrient-rich eutrophic lake, in comparison to more oligotrophic types.

Dollar Lake, Portage County, Ohio is currently being investigated as a representative of an extremely eutrophic lake. Preliminary studies on lakes which do not receive agricultural or septic tank effluent are underway.

SUPPORTED BY Kent State University

5.0894, ECOLOGICAL SUCCESSION IN A NORTHEASTERN OHIO RESERVOIR

G.D. COOKE, Kent State University, Graduate School, Kent, Ohio 44240

The purpose of the investigation is to study the structure and function of the plankton community down the length of Lake Rockwell, a long, narrow reservoir in Portage County, Ohio. The reservoir is fed by the nutrient-rich Cuyahoga River. It is hypothesized that the portion of the reservoir nearest the entrance of the river will be more eutrophic and therefore an ecologically more immature community, in comparison to that portion of the reservoir furthest from the input of nutrient-rich water.

Water samples will be collected at stations along the river and reservoir, and analyzed for nitrate, phosphate, and chlorophyll, and for number, kinds, and biomass of plankton organisms. Community photosynthesis will be measured by light and dark bottle methods. Other data of limnological importance will be collected.

5.0895, A FIVE YEAR LIMNOLOGICAL STUDY OF A NEWLY CREATED ACID MINE WATER IMPOUNDMENT

C.V. RILEY, Kent State University, Graduate School, Kent, Ohio 44240

A limnological study of a newly created 3.5 acid mine water impoundment is being conducted. The impoundment was created on the site of a former 'gob' waste dump and mine drainage ditch. Physico-chemical data concerning the mine drainage were collected prior to impoundment. Analyses have been continued on the impounded water, at various levels, as the waste materials were submerged. Analysis include, pH, specific conductance, total acidity, total alkalinity, dissolved O₂, free CO₂, dissolved solids, Fe, Zn, Al, Mn, hardness, Ca, Mg, etc. Monitoring equipment is to be installed in 1968. Continuous monitoring of pH, D.O., solids, total alkalinity and temperature will be included.

SUPPORTED BY Kent State University
Ohio Reclamation Association

5.0896, ELECTRODIALYSIS TREATMENT OF SECONDARY EFFLUENT

C.A. BRUNNER, U.S. Dept. of Interior, Leb. Adv. Waste Tmnt. Plant., Lebanon, Ohio

Electrodialysis is being pilot tested to determine the feasibility of the method for partially demineralizing municipal wastewater. The partial demineralization is necessary for removal of the increment of inorganic material added during use and becomes especially important when multiple reuse of the water is considered.

The pilot system consists of a 50-gpm electrodialysis stack. Feed to the stack is clarified and granular-activated-carbon treated municipal secondary effluent. The design value of the fraction of mineral removal is 40 percent. Concentrated waste rate is maintained at less than 10 percent of the product rate. During operation the degree of demineralization is monitored frequently by conductivity measurements of feed and product. Analyses of principal ions are obtained occasionally.

An operating problem that has been encountered is anion membrane fouling. The result of fouling is a decline in demineralization. Since the problem first arose, much of the experimental work has been aimed at overcoming it. Although fouling has been reduced by improved clarification, it has not been completely eliminated. The fouling materials can be removed by allowing the equipment to remain idle for several days.

In spite of the fouling problem, electrodialysis is considered to be technically feasible. Longer study is required to determine accurately the economic feasibility, but present estimates indicate the process is practical.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0897, SINGLE STAGE LIME TREATMENT WASTEWATER

C.A. BRUNNER, U.S. Dept. of Interior, Leb. Adv. Waste Tmnt. Plant., Lebanon, Ohio

In certain envisioned reuses of wastewater, it is essential to remove suspended material. Chemical clarification with lime is one possible method of removal. In this study, lime clarification is being used to treat municipal secondary effluent prior to granular activated carbon treatment and demineralization by electrodialysis.

Secondary effluent is supplied to a circular up-flow clarifier at a rate of 75 gal. per min. Lime slurry and secondary effluent are mixed in a rapid mix zone where precipitation occurs. The mixture passes through a sludge blanket and finally into the sedimentation zone. The effluent from the clarifier is further polished with two dual media filters (anthracite and sand). The total organic carbon, suspended solids or turbidity, alkalinity, hardness, and phosphate concentration of feed and product water are monitored. The most important operating variable is clarifier pH. Studies are being made over the range 9 to 10.5. Limited study has been made of flocculant aids.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Results indicate that good clarification can be obtained at pH values from 9 to 10.5 without a flocculant aid. Phosphate removal is also good over that pH range. Significant calcium and alkalinity removals occur at pH of 9.5.

5.0900, THE EFFECTS OF ENVIRONMENTAL CONDITIONS ON THE SPAWNING AND SURVIVAL OF FRY OF THE WALLEYE

V.C. APPELGATE, U.S. Dept. of Interior, Biological Station, Sandusky, Ohio

The recent decline of walleye stocks in Lake Erie following a man induced acceleration of the eutrophic process in the lake demands investigation of the many environmental factors which might influence the survival of young walleyes. Temperature monitoring stations have been established on three known walleye spawning grounds (reefs) in the western basin with the object of determining the effect of temperature regimes during spawning and fry development in the success of walleye hatches. These records will also be used to determine the effects of temperature on the timing and abundance of food organisms that may be essential to the survival of walleye fry when they first begin feeding.

Walleye fry have proved elusive and difficult to capture during their first 6 weeks of life. Measurement and recording of the direction and velocity of water currents on these reefs during the walleye spawning season have been instituted with the objective of casting some light on the dispersal of the fry.

Subsequently, automatic devices for the regular and periodic sampling of plankton organisms on and near the reefs will be devised and incorporated into this experiment. Qualitative and quantitative examination of these samples will be compared with the planktonic diet of fry captured during their first weeks after hatching.

5.0902, DETAILED CHARACTERIZATION OF SOILS AND VEGETATION AT SELECTED SITES TO SERVE AS BASIS FOR FUTURE EVALUATION OF RADIOACTIVE CONTAMINATION

J. HAGHERA, Ohio Agric. Res. & Dev. Ctr., Wooster, Ohio 44691

Field, laboratory, and greenhouse investigation of soils and vegetation from selected sites in Ohio to aid in evaluating the role of soil fixation, leaching, run-off, erosion, and possible concentration by plants in the disposition of radioactive contamination.

Soil samples, plant material, and run-off from Sr90 and untreated plots will be analyzed for Sr90 as well as the determination of other soil properties and composition, the soil profiles of the various plots are being characterized and the inorganic and organic fractions of the soil are being studied to determine their influence on the retention or release of Sr90. Soils and vegetation of small watersheds are being analyzed for gamma emitting isotopes. The uptake of Sr90 by various plant species grown under different conditions is underway.

SUPPORTED BY Ohio State Government

5.0903, PHYSICAL AND CHEMICAL CHANGES IN WEATHERING COAL SPOILS-EFFECT ON WATER SUPPLY AND PLANT GROWTH

J.P. VIMMERSTEDT, Ohio Agric. Res. & Dev. Ctr., Wooster, Ohio 44691

Objectives: To study the physical and chemical properties of weathering coal spoils. (1) To study the composition of ground water leaching from coal spoils as it changes with time. (2) To determine the distribution between runoff and infiltration of rain falling on spoil banks. (3) To study the composition of spoil air. (4) To follow the variation in spoil temperature with season, depth, and stage of weathering. (5) To measure the rate of settling of fresh spoil material and the change in particle size as the spoil weathers. (6) To determine the spoil factors affecting tree seedling survival, growth, and mineral composition.

Procedure: Lysimeter studies, by which objectives 1,3,4, & 5 have been pursued, will be continued. Field studies will incorporate objective 2.

5.0904, EFFECT OF IMPOUNDMENTS ON WATER QUALITY

W.R. DUFFER, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

The purpose of this investigation is to optimize reservoir water quality with regard to dissolved oxygen, excess nutrients, algal blooms, toxic chemicals, and releases to maintain flow and support stream life.

Pre-impoundment data for the Arbuckle system have been collected at four stream stations since December 1965. Arbuckle reservoir was closed in January 1967, and biweekly sampling of chemical and microbiological parameters continues at pre-impoundment stations. Background data also exist on benthic macroinvertebrate population structures for these stations. The four pre-impoundment stream stations will be used to monitor water quality changes after the reservoir fills and can be used for comparison with background data collected prior to filling.

When Arbuckle Reservoir fills, sampling locations and schedules will be established for monitoring reservoir water quality changes. The immediate objective of this project is to relate

5. WATER QUALITY MANAGEMENT AND PROTECTION

biological and chemical parameters to the water quality of the reservoir by measuring the extent of their change in a relatively undisturbed system. Future studies will measure the extent of change in critical parameter in reservoir systems receiving waste materials.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0905, STREAM REAERATION

W.R. DUFFER, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

The purpose of this investigation is to correlate stream reaeration rates with parameters expressing stream geometry and flow. This work will essentially extend the work of other investigators from tidal estuaries and streams having large flows to low-flow streams which are more representative of the southwestern United States.

In addition, the study will lead to an evaluation of the actual oxygen balance of the system with reference to photosynthesis, respiration, and diffusion. Further, the study will differentiate between these oxygen parameters in both the free-flowing stream and the benthos.

Present investigations are under way at the two test sites in Rock Creek, a stream of the Arbuckle impoundment system. One site is located upstream from a municipal sewage disposal plant, while the other is located downstream from the plant. Both sections of Rock Creek are characterized by limestone substrate. Plastic chambers will be used to separate the effects of photosynthesis, diffusion, and respiration under conditions of very little organic enrichment (upstream) and heavy organic enrichment (downstream).

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0906, PIGMENT ANALYSIS FOR THE DETECTION OF ENRICHMENT

W.J. DUNLAP, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

Enrichment of surface waters by fertilizing nutrients from waste effluents and other sources is of major concern in water pollution control. Quantitative assessment of the extent and effect of enrichment is, however, very difficult by presently available methods. Previous studies have indicated that pigment compositions, particularly carotenoids-chlorophyll *a* ratios, of phytoplankton may vary in a regular and predictable manner with changes in nutrients present in the aquatic environment. The purpose of this research is to determine if analysis of phytoplankton pigments may be conveniently utilized for detection and evaluation of enrichment in surface waters.

Current research involves development of improved methods for the qualitative and quantitative determination of phytoplankton pigments in aqueous media. Methods developed will be employed for study of the effect, under controlled environmental conditions, of single nutrients and mixtures of nutrients on pigment compositions of unialgal cultures, mixed algal cultures, and mixed bacterial-algal cultures. Emphasis will be placed on definition of pigment concentrations and ratios indicative of enrichment; possible utilization of phytoplankton pigment concentrations for prediction of impending nuisance algal blooms will also be investigated.

5.0909, THE CHARACTERISTICS AND POLLUTIONAL PROBLEMS OF IRRIGATION RETURN FLOWS

J.P. LAW, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

Preparation of a comprehensive report that will reflect the status of present knowledge regarding the pollutional problems associated with irrigation waste waters and their effects upon water quality of surface streams and groundwater resources in the United States.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0910, REMOVAL OF NUTRIENTS FROM ENRICHED FLOWS & WASTE EFFLUENTS BY THE HYDROPONIC CULT OF SUITABLE FORAGE PLANTS & GRASSES

J.P. LAW, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

Hyponic culture is a well-established method for growing many different types of plants. Normally, solutions are prepared with proper proportions of all required nutrients and are fed to the root systems of the growing plants. Algae have been grown for the removal of nutrients from lagoons receiving sewage effluents, but the difficulty of harvesting the growth makes this an undesirable approach.

It is proposed that higher plants can be successfully grown using a gravel-bed support in specially designed structures for the removal of nutrient materials remaining in waste effluents. Some of the principal objectives of this research are: 1. To improve the quality of surface streams receiving wastes and effluents by the removal of nutrients. 2. Finding the most suitable plants to be grown by this method. 3. Determine economic feasibility of the method, based on expected yield, cost of installation, operation, harvesting methods, etc. 4. Determine quantities of nutrients removed by the process. 5. Propose design criteria for application of the method to waste treatment installations.

5.0911, DYNAMICS OF RESERVOIR DESTRATIFICATION

L.E. LEACH, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

This investigation is being carried out to determine the effective limits and direction of circulation of water using a compressed air diffuser system. A study will be made on systems of several sizes or a series of systems based on the physical characteristics of study reservoirs. Destratification studies have been employed only in relatively small impoundments. The present study is unique since it is being conducted in the central pool of a large reservoir, Eufaula Reservoir, near McAlester, Oklahoma, containing approximately 600,000 acre-feet at power pool elevation 585.0 and having an average depth of 60 feet.

The system used supplied compressed air to an arrangement of filter stones at a depth of 75 feet for 30 days. Vertical profiles of data concerning the kinetics of the system were collected at selected buoy stations prior to, during, and following artificial destratification. Natural thermal stratification was measured in non affected areas of the reservoir for comparative purposes.

The study was begun in June 1967, and it is continuing until the reservoir becomes isothermal due to seasonal conditions. Modifications of the compressed air diffuser system will be made following corollation and evaluation of 1967 data. The modified

5. WATER QUALITY MANAGEMENT AND PROTECTION

system will be installed and operated in the central pool of Eufaula Reservoir in the spring, summer, and fall of 1968.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0912, PHOSPHATE REMOVAL BY ACTIVATED SLUDGE PROCESS APPLICATION - PLANT SCALE DEMONSTRATION

L.D. LIVELY, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

Objective - The positive confirmation of an imposed biological phosphorus removal on a sustained basis at a plant which had a prior record of limited removal of phosphorus.

Locate and study activated sludge sewage treatment plants which meet critical design criterion pertinent to biological phosphate removal. The plants are to be located in different geographical regions of the Continental U.S.A. Chemical and operational characteristics will be determined to ascertain what changes are necessary for such plants to serve as demonstration plants for the biological phosphate removal process.

Description - 1. Negotiate, establish, and monitor plant scale research demonstration for five municipalities to be operated for one full year. 2. Establish system to monitor three additional sewage treatment plants known to be removing phosphorus by the activated sludge process at the present time. 3. Conduct survey and amenability studies on four more activated sludge plants in the Northeast, Southeast, Northwest, and Southwest Regions of the FWPCA to complete scope of phosphate removal project in selecting plants and identifying parameters critical to mechanism, kinetics, operation, and sustenance of the process.

5.0913, MINING-POLLUTION CONTROL TECHNOLOGY - OIL PRODUCTION GROUND-WATER RECLAMATION BY SELECTIVE PUMPING

L.G. MCMILLION, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

This is a field research project designed to develop and demonstrate a method for alleviating brine contamination in ground water reservoirs by selective development and pumping of the contaminated water. The contaminated area to be investigated is similar to many hundreds of other contaminated areas in the southwest, especially in West Texas and New Mexico where localized contamination has resulted from land disposal of oil field brines. The project will develop guidelines for use by industry and governmental agencies in the correction of ground-water contamination and will report on the practicability of use of poor quality water for secondary oil recovery. Field site for the project is near Hobbs, New Mexico.

5.0914, RESEARCH NEEDS PERTAINING TO PETROLEUM WASTE WATERS

L.H. MYERS, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

A state of the art paper will be written concerning the petroleum industry and its waste water problems. The report will encompass three sections in the petroleum industry--(1) production, (2) refining, and (3) transportation.

This report will contain research needs in the petroleum waste water field with priority to the most prevalent pollutants in each section.

The report is intended as a general source of information to administrators, scientists, and individuals involved in water pollution control.

A need exists to determine the magnitude, severity, and potential management of petroleum waste waters.

5.0917, FATE OF POLLUTANTS IN GROUND WATER

M.R. SCALF, U.S. Dept. of Interior, R.S. Kerr Water Res. Ctr., Ada, Oklahoma 74820

Traditionally, it has been and continues to be the practice of water users in the High Plains area of West Texas and Eastern New Mexico to recharge aquifers with playa lake water. In doing so, the aquifer recharged risks contamination by chlorinated hydrocarbons and nitrates resulting from agricultural practices. It is of concern that chlorinated hydrocarbons, in particular, adsorb to aquifer material in the near proximity of the recharge well and then are released in high concentrations when that well is pumped. This project is being conducted cooperatively by the Robert S. Kerr Water Research Center of the Federal Water Pollution Control Administration and the Southwestern Great Plains Research Center of the U. S. Department of Agriculture. The experiment will be at the latter's installation at Bushland, Texas.

The scope of this project will be to determine the distance which pollutants travel in a fresh water aquifer under recharge conditions and the temporal distribution of these concentrations when that same well is pumped.

5.0919, APPLICATION OF RADIOISOTOPE TECHNIQUES TO A CRITICAL WATER RESOURCES PROBLEM AREA (NUTRITIONAL POLLUTION)

G.W. REID, Univ. of Oklahoma, School of Engineering, Norman, Oklahoma 73069

5. WATER QUALITY MANAGEMENT AND PROTECTION

The limiting growth factor of either nitrogen or phosphorus on the growth of algae in sewage treatment will be evaluated by using radioisotope tracer techniques. Phosphorus-32 tagging will be used to determine phosphorus assimilation.

The intermediate goal will be to provide basic data for selected nutrients in terms of the degree of sewage treatment to make possible the use of a mathematical model of nutritional pollution, and the final goal being to determine the dilution ratios based on the optimization of net benefits arrived at from nutritional, thermal and degradable pollution models.

University of Oklahoma Research Institute

5.0921, EVALUATION OF DISPERSED POLLUTIONAL LOAD

G.W. REID, Univ. of Oklahoma, Research Institute, Norman, Oklahoma 73069

The purpose of this proposal is to develop a technique of evaluating the dispersed pollutional load. Municipal and industrial outfalls; storm, and combined sewer discharges are point sources of pollution, where as natural pollution, rural runoff, and direct urban runoff represent dispersed sources of pollution. Considerable technological capability exists for dealing with the point sources. Large pollutional loads have been demonstrated resulting for urban run off--dispersed load and storm sewers and the pollution resulting from dispersed sources (including storm sewers as collectors of urban runoff) is not as amenable to control by technological means as is that from point sources. The few studies made of the quality of direct urban runoff demonstrates that this pollution potential is a part of the land-pollution central problem and that the major factor that determines the extent and nature may well be public conscience.

This proposal is concerned with the development of a technique of identifying the source of dispersed load, not the magnitudes as such, but as a byproduct. Once the sources are identified, remedial action can be instigated. The technique involves analytically determining the dispersed load for an urban area and then correlating it to the land use practices. The City of Greater Tulsa has been selected for this study. Analytical Data on waste quality is available and will be gathered at point discharges (sewage plants) and on the receiving stream (Arkansas) above and below the urban area. The city of Tulsa has available an elaborate data-retrieval of land use practices starting in 1960 providing six years of records. To increase the data pool, the Tulsa area will be divided into eight sub-drainage basins.

The specific technique will be to identify the principle components of land use as they relate to the dispersed pollutional load (essentially these will be flush out periods minus the point source contributions). The load will be characterized by COD, BOD, Solids, Oil, Nitrogen, Chlorides, and Phosphate.

University of Oklahoma Research Institute

5.0923, DEMONSTRATION PROJECT OF A PROTOTYPE TREATMENT PLANT DESIGNED TREAT WASTES FOUND AT A COMBINED SEWER OVERFLOW

R.G. PUGH, Rhodes Corporation, Oklahoma City, Oklahoma

The project provides for the complete demonstration of a prototype treatment plant to treat wastes typical of those found at a combined sewer overflow. The prototype treatment plant shall consist of screen, cyclone, air flotation unit and all auxiliary equipment including recording flow metering devices and provision for chemical flocculation, necessary for a complete demonstration. Complete demonstration shall consist of design, fabrication, construction, operation and evaluation of said prototype plant.

The work will be accomplished in four phases as follows: Phase I - Design. To include basic design criteria development for mechanical cyclones and dissolved gas flotation cells for high rate handling of sewage flows. Phase II - Fabrication and Construction. To include design, specification, fabrication and erection of a working demonstration plant. Phase III - Operation and Evaluation. Phase IV - Final Report.

5.0924, ASSESSMENT OF ENVIRONMENT FACTORS INFLUENCING THE DISTRIBUTION OF BOTTOM FISHES IN RESERVOIRS

R.C. SUMMERFELT, State Dept. of Wildlife Cons., Oklahoma City, Oklahoma

The objective is to provide an assessment of the relationship between the distribution of reservoir fishes, particularly bottom dwelling fishes, and the quantity and character of sediment in reservoirs. The study will be conducted in Lake Carl Blackwell, a 30- year-old, 3,000 acre impoundment in Payne County, Oklahoma.

The study will require six months of preliminary fishing gear evaluation and a preliminary sediment survey along established transect lines. Deep trap nets, modified hoop nets, slat traps, trammel and gill nets will be evaluated for selectivity and efficiency in collecting fishes in selected habitats in Lake Carl Blackwell. Sediments will be collected by use of a Phlager gravity corer with a two meter coring tube. Sediment will be analyzed for organic content, particle size distribution and a numerical count of benthic invertebrates. Sites for intensive study will be based on evaluation of preliminary studies and specific gear will also depend on preliminary gear evaluation. Intensive study of select habitats should commence in the summer of 1967. An analysis of fish distribution will be stratified according to species, season, and vertical variation in abundance.

5.0926, OPERATIONAL STABILITY OF THE EXTENDED AERATION PROCESS

A.F. GAUDY, Okla. St. Univ. of Agr. & Sci., School of Engineering, Stillwater, Oklahoma 74075

Preliminary investigations on the stability of operations of the extended aeration process (no sludge wasting) over a period of nearly one year indicated that while the unit activity of the sludge dropped off during the operational period, the total waste

5. WATER QUALITY MANAGEMENT AND PROTECTION

purification capacity of the process remained extremely high. The proposed laboratory investigations are directed toward determination of the useful life of an extended aeration process and determination of the biochemical causation for breakdown, if such systems do eventually break down. It is also intended to determine the degree of stability of the process under changing environmental conditions and whether there is any useful parameter (s) which can be used to predict either impending upsets or continued efficient operation.

Laboratory pilot plants will be operated and all sludge except a small measured amount (plus or minus 2%) for analyses and batch experimentation will be returned to the aerator. Substrate removal efficiency, biological solids production, and sludge composition will be determined, and small sludge samples will be taken for measurement of unit activity with respect to oxygen uptake and substrate removal. Analysis of the data should permit useful conclusions concerning the utility of the process and possible ways to extend its use to a greater variety of waste water applications.

5.0927, KINETICS AND MECHANISM IN ACTIVATED SLUDGE PROCESSES

A.F. GAUDY, Okla. St. Univ. of Agr. & Sci., School of Engineering, Stillwater, Oklahoma 74075

The broad objective of the proposed research is the attainment of a more sound understanding of the basic chemical, physical, and biological factors underlying the kinetics and mechanisms involved in growth and substrate utilization in heterogeneous populations with particular reference to waste water purification in continuous and discontinuous activated sludge processes.

Since its initiation in 1962, the research has progressed toward accomplishment of this goal through the conduct of massive, long-term experiments under closely controlled conditions using a variety of steady, well-defined chemical and physical environments. A large number of analytical parameters have been determined and subjected to statistical analysis. Through continuation of this approach, the completion of the work should allow determination of the mechanistic and kinetic parameters which are of significance in formulations of predictive value for design and operation of activated sludge processes. During this renewal period all results obtained on this project will be integrated and consolidated with results of related studies conducted on the biological response to a changing environment (WP-00075) and with studies conducted on genetic and enzymic mechanisms of metabolic control applicable to heterogeneous populations (WP-00786).

5.0929, COMPARISON OF ENERGY FLOW PARAMETERS OF MIDGE POPULATIONS IN BIOLOGICAL OXIDATION PONDS

J.L. WILHM, Okla. St. Univ. of Agr. & Sci., Graduate School, Stillwater, Oklahoma 74075

The proposed research involves a study of the effects of pollution on the flow of energy through populations of midge larvae (bloodworms). Midge larvae are extremely abundant in enriched areas and have a pronounced effect on the ecosystem. The experimental area is a series of 10 biological oxidation ponds which are the terminal treatment of effluent from an oil refinery in Ponca City, Oklahoma. Thus, it will be possible to compare bioenergetics of the populations under varying degrees of pollution.

The procedure includes the following: 1) Measure energy content in the diet items, in the standing crop of the different instar stages of bloodworms, and in the major predators of the bloodworms in four of the series of 10 ponds. 2) Measure aerobic respiration rates in the different instar stages of bloodworms inhabiting the different ponds. 3) With the data accumulated in the study and in a concomitant study of bloodworm populations, construct energy flow models for the bloodworm populations living under different levels of environmental stress. 4) Discern variations in water quality as reflected in energy flow and in ecological ratios in bloodworm populations.

5.0930, STREAM CHANNEL STABILIZATION SEDIMENT CONTROL WORKS IN CHANNELS

W.O. REE, U.S. Dept. of Agriculture, Stillwater, Oklahoma

Object: To determine the relationships between flow characteristics and scour or deposition in channels; to measure the effectiveness of various vegetal and structural materials proposed for use in channel protection; to develop protective works for channel banks; to establish design criteria for systems of grade control structures for channel stabilization; and to evaluate the role of reservoirs on channel stability for the range of conditions encountered in agricultural watersheds.

Plan of Work: Measurements are made on natural stream channels to obtain data on rates, amounts and size distribution of transported sediment; rate and depth of flow and water temperature; bank and bed materials; vegetation on the bed and banks of the stream; hydraulic properties of the stream including cross-section, slope, and bed form, and on geologic, topographic or structural features which influence the course of the stream. The influence of any one of these factors under field conditions is obscured by the interrelationships involved and the complexity of the flow phenomenon. Flume studies made at the USDA Sedimentation Laboratory and elsewhere are used to help interpret field observations. Channel liners, both structural and vegetal, are placed in outdoor test channels and subjected to controlled test flows. These tests lead to establishing values of critical tractive force or permissible flow velocity to which channel liners can be subjected. Specific structures are tested by the use of small models in sand bed model basins.

5.0933, SURVIVAL OF FOOD PATHOGENS IN RADIATION PASTEURIZED SEAFOOD *A.W. ANDERSON, Oregon State University, Graduate School, Corvallis, Oregon 97331*

Previous studies were conducted under controlled conditions in order to observe the resultant survival patterns in solid crabmeat and in Hartsell's broth of *Salmonella enteritidis*, *S. paratyphi* A, *S. choleraesuis*, *S. pullorum*, *Streptococcus pyogenes*, and *Staphylococcus aureus* after individual exposure to Co60 irradiation. A 'tailing off' was found in the survival patterns of *S. paratyphi* A, *S. pullorum*, *S. enteritidis*, and *S. aureus* when irradiated in crabmeat, but was not found upon exposure in Hartsell's broth. However, *S. choleraesuis* and *S. pyogenes* showed a definite 'tailing off' in the broth while only weakly, if any, in the crabmeat. Thus this 'tailing off' phenomenon cannot be explained as a mere effect of the medium, but rather indicates a much more complex situation. The results indicate that predictable pasteurization doses usually based on D values would be quite inaccurate, since the projection is based on sigmoidal and linear inactivation curves.

In this investigation we have compared the irradiation resistance and observed the survival of moderate to low levels of inoculum using nonsporeforming food intoxication and infection microorganisms associated with seafoods. Previous experiments reported were designed to observe the effects of added water on influencing the tailing phenomenon, the effects of low levels of radiation on various types of seafoods inoculated with high levels of microorganisms.

5.0938, INVESTIGATION OF AQUATIC WEED PROBLEMS AND MEANS OF CONTROL WITH EMPHASIS ON BRAZILIAN WATERWEED *C.E. BOND, Oregon State University, School of Agriculture, Corvallis, Oregon 97331*

Objectives: 1. To determine means of controlling Brazilian waterweed and other nuisance aquatic plants. 2. To assess impact of control measures on recreational, industrial, and domestic uses of the bodies of water involved.

Progress to Date: Preliminary screening tests have been carried out to determine the effectiveness of a number of chemicals against Brazilian waterweed, and secondary tests using some of the more effective have been run at several concentrations. Cultures of aquatic vertebrates are being started.

SUPPORTED BY Oregon State Government

5.0939, DRAINAGE OF STRATIFIED SOILS *R.H. BROOKS, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331*

OBJECTIVES: 1. To determine useful criteria for the design of subsurface drainage systems. 2. To develop new methods and materials for determining criteria for draining shallow soils. 3. To determine the drainage requirement of various crops in the Willamette Valley.

DESCRIPTION OF WORK PROPOSED: A number of proposed drainage sites on which a farmer expects to install drainage tile will be selected for subsequent study after tile installation. The sites will be selected based upon soil type, cooperation, and location. These drainage systems will be thoroughly studied and evaluated in an attempt to arrive at useful design information.

5. WATER QUALITY MANAGEMENT AND PROTECTION

An additional site will be selected to study and develop new methods and materials for draining shallow soils, i.e., plastic drain pipe, vertical mulching, envelope materials, etc. This site will also be used to determine the drainage requirements for a few selected crops

SUPPORTED BY Oregon State Government

5.0940, PULP MILL EFFLUENT DISPOSAL

F.J. BURGESS, Oregon State University, School of Engineering, Corvallis, Oregon 97331

The proposed research is a continuation of 'Biological-Engineering Studies of the Rate and Effects of Kraft Pulp Mill Effluents in the Marine Environment', that has been initiated under project WP-524. The project objectives are twofold, these being to investigate the area and degree of biological influence from a typical ocean outfall from a kraft pulp mill by a combined engineering-biological study involving presently known methods for measuring or determining waste dispersion, degradation and/or reduction in BOD, COD, PBI and other physical measures with biological measures developed in previous research such as toxicity to the embryo of the bay mussel, the pacific oyster and other forms. The objective of this phase is to place an overall water quality impact interpretation on such an outfall installation which will incorporate the bits and pieces of various projects by this and other investigators.

In this phase aerial photo interpretation of waste dispersion plumes will be attempted and compared with conventional dye studies in an attempt to utilize this recently suggested technique. The combined efforts to undertake the above objective are further supported by the biological objectives of the project which are the further development of bioassay methods and the interpretations that may be placed on bioassay findings. In this phase, it is hoped to relate short-term median tolerance limits (commonly used TL50) of kraft pulp mill waste to commonly used short-term bioassay organisms to concentrations that demonstratively impair growth and performance in juvenile English Sole *Parophrys vatalus*. Similar determinations for other commercially important fish will hopefully develop from this effort if successful.

The overall objective is to attempt an interpretation of bioassay findings in terms of the actual circumstances found during waste discharge.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0941, AIRPHOTO ANALYSIS OF OCEAN OUTFALL DISPERSION

F.J. BURGESS, Oregon State University, School of Engineering, Corvallis, Oregon 97331

The general objective of this research is to develop a remote sensing tool for the evaluation of dispersion of wastes from existing or proposed ocean outfalls. Since sampling from a boat is difficult and/or impossible much of the time in the near shore areas, it is proposed to investigate the feasibility of using photogrammetric and photo interpretation methods to determine dispersion patterns, diffusion coefficients, waste concentrations and near shore currents.

More specifically the aims of this investigation are: 1. To develop a set of characteristic airphoto pattern elements for estimating diffusion coefficients. 2. To determine the relationship between photographic film density and waste concentration. 3. To determine the optimum film-filter combination for flume delineation and waste concentration measurement.

5.0943, TOXICOLOGY OF PESTICIDES IN THE ENVIRONMENT

S.C. FANG, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

The investigational program proposed under this grant is an interdisciplinary effort to evaluate the environmental toxicology of multiple pesticide residues. The investigational plan envisions the study of the behavior of pesticides in the environment, particularly in soil, as it relates to contamination of air and water. Persistence of pesticides in the environment as influenced by chemical parameters and parameters of the environment will be evaluated. These studies lead to assessing the magnification or attenuation of pesticide residues to the food chain of the highest organism. Studies will be performed on the effect of the pesticide residues on mammals or from the standpoint of pharmacology and histopathology. Since the effect of these pesticides will be often expressed at the cellular and subcellular level, biochemical studies on the effect of the pesticides on enzymes and the effect of pesticides on metabolic pathways will be studied.

The work as proposed above implies the three objectives of the project; namely, (1) to investigate and establish principles by which the biological effects of multi-chemicals in the environment can be evaluated, (2) to develop more reliable and systematic methods of analyses for pesticides in water, soil, air, and biological tissues and to provide analytical research assistance to an interdisciplinary group, (3) to assist the physical and chemical properties of pesticides and to relate these properties to the behavior of such compounds in the environment.

5.0944, CHEMICAL BRUSH CONTROL - BIOCHEMISTRY AND TOXIC HAZARD

V.H. FREED, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. To improve the efficiency of herbicide action through a better understanding of the influences of additives, formulation, molecular variation and the various physiological and environmental factors as they affect absorption, translocation and metabolism of herbicides. 2. To determine the ultimate fate of herbicides, herbicide metabolites, and residues in plants, soil and water with respect to the extent and magnitude of the watershed contamination problem.

Description of the Work Proposed: 1. Radioactive herbicides will be used to investigate the factors outlined in Item 1 above, in laboratory, greenhouse, and growth chamber studies utilizing a variety of resistant and non-resistant brushy species. The principles developed in these studies will be further tested in the field. 2. An intensive water, soil, and air sampling program will be used to determine the magnitude of contamination resulting from brush control operations on forest lands. Radio tracer techniques, organic extraction and various types of chromatography will be used in the greenhouse and field studies to locate and identify the various herbicide metabolites and residues in the environment.

5.0945, TOXICOLOGY OF PESTICIDES IN THE ENVIRONMENT

V.H. FREED, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

5. WATER QUALITY MANAGEMENT AND PROTECTION

The objectives of this research program are as follows: 1. To investigate and establish principles by which the biological effects of multichemical residues in the environment can be evaluated. 2. To develop more reliable and systematic methods of analysis for pesticides in food, water, soil, air and biological tissues and to provide analytical research assistance to other workers engaged in this field of research. 3. To assess the physical and chemical properties of pesticides and to relate these properties to the behavior of such compounds in the environment.

Studies include determination of pesticides in simple food chains in model aquatic systems to establish effect on elements of the food chain. Investigation of the effects of environmental levels of pesticide on total organisms include their pharmacological effect, metabolism and alteration of metabolic patterns. Biological studies are being conducted to elucidate the effects of pesticides. The behavior of pesticides in the environment are also being studied correlating the other studies.

5.0946, MACRO-FAUNA IN WASTE STABILIZATION LAGOONS

R.L. GOULDING, Oregon State University, School of Agriculture, *Corvallis, Oregon 97331*

Waste stabilization lagoons are man-made environments that are becoming a more prominent feature of land use. The fauna adapted to this habitat has received little attention. In view of the potential importance of the macro-fauna which may be beneficial in that they contribute to the biological breakdown of organic matter or harmful as potential disease vectors or nuisance organisms, it is imperative that a thorough ecological study of this habitat be carried out.

The long-term objectives of this proposal are to measure the contribution of the macro-fauna in the breakdown of putrescible organic wastes; to understand the pathways through which this is effected; and to assess the beneficial and detrimental results caused by the macro-fauna in lagoons of various designs.

The major emphasis will be a study of the production ecology of *Glyptotendipes barbipes*; the most abundant macro-invertebrate in the lagoons.

5.0947, EFFECTS OF LOGGING ON SALMON POPULATIONS IN COASTAL STREAMS

J.D. HALL, Oregon State University, School of Agriculture, *Corvallis, Oregon 97331*

Objectives: This segment of research is part of the Alsea Watershed Study, designed to determine the effects of Douglas-fir logging practices on the physical and biotic resources in small coastal watersheds. The objective of the research covered in this proposal is to determine the effects of two patterns of timber harvest (complete clear-cut vs patch-cut) on the abundance of coho salmon in these coastal streams. The work funded by this proposal would be concerned mainly with analysis, interpretation, and publication of results of the study.

Procedures: Three adjacent watersheds were selected for study in 1958. They are typical of the headwaters areas used for spawning and rearing by coho salmon in the coastal region. Seven years of intensive study preceded the logging operations, which were conducted in 1966. One watershed was completely clear-cut, another was patch-cut, and a third will be held as a control for the remainder of the study, scheduled for seven additional years. Data on abundance, growth, and survival rates of the coho salmon have been collected from the fish traps and by additional sampling in the streams over the entire period. The study will continue to gather and analyze comparable data following logging to determine the impact of the two patterns of harvest on the salmon populations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0948, STUDIES ON EFFECTS OF WATERSHED PRACTICES ON STREAMS

J.D. HALL, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

Objectives of this study are to determine the effects of timber harvest practices on the physical and chemical characteristics of coastal streams and on fixation of energy by stream periphyton and inflow of organic detritus. Mean levels and variabilities of suspended sediment discharge, stream temperature, net solar radiation, chemical water quality, primary production by periphyton, and inflow of plant detritus will be established during a two year pre-logging period 1966-68. Studies will continue during logging in 1966 and for two years after harvest.

5.0949, ECOLOGICAL-PHYSIOLOGICAL INVESTIGATIONS OF LITTORAL DIATOM COMMUNITIES OF THE YAQUINA RIVER ESTUARY

C.D. MCINTIRE, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

The long-term plan of the proposed research program is to study, through analyses of data obtained in the laboratory and field, the physiological ecology of littoral diatom communities of the Yaquina River estuary. A marine laboratory ecosystem and respirometer chamber have already been designed and partially constructed. The laboratory ecosystem is designed to maintain control over such environmental variables as light, temperatures, salinity, and period of inundation (tidal cycle), and the effect of these factors on primary production, community respiration, and the species composition of the diatom communities will be stressed. Ultimately an attempt will be made to interpret the laboratory data in terms of the results of field observations (i.e., the adaptive characteristics of the organisms, their distribution in nature, and previous history of the environment from which they were collected), therefore maintaining close contact with the realities of Yaquina estuary itself. After such fundamental information has been acquired, the program will be expanded to the study of trophic relationships between characteristic attached micro-algae and grazing animals as influenced by various environmental factors, including the effects of domestic and industrial use of this water resource.

5.0950, EFFECTS OF PESTICIDES ON ESTUARINE ORGANISMS

R.E. MILLEMANN, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

1. To evaluate, through short-term bioassays, the acute toxicity to certain estuarine organisms of the insecticide Sevin. 2. To determine the effects of Sevin on a community of organisms in artificial mud flats. 3. To follow the residual life and metabolism of Sevin in estuarine organisms and in their environment. 4. To study compounds related to Sevin, as well as other pesticides, in the above manner.

SUPPORTED BY Oregon State Government

5.0951, PHYSICAL FACTORS AFFECTING OREGON COASTAL POLLUTION

V.T. NEAL, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

The central aim of this research is to provide information on and an understanding of the physical factors that will control the pollution of certain Oregon coastal areas. These physical factors are primarily circulation and water density distribution (therefore salinity and temperature) in the nearshore region and the tidal regime in and near the mouths of estuaries. Dissolved oxygen will also be an important factor in determining 'safe' pollution levels. Therefore these factors will be measured and their variability determined at selected places.

The time variability of these factors will be determined as a function of seasonal and meteorological conditions.

All data forthcoming from this project will be made available immediately to the Pacific Northwest Water Laboratory at Corvallis, Oregon. Since the knowledge to be gained by this project is needed by that agency, the planning and operation of this program will be arranged in close cooperation with the personnel of that agency.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0952, STUDIES ON AQUATIC MYXOBACTERIA

R.E. PACHA, Oregon State University, Graduate School, Corvallis, Oregon 97331

Ecological studies are being carried out to determine the role and activities of myxobacteria in the freshwater environment. In particular it is of interest to ascertain the importance of these organisms in the decomposition of pollutional materials and their possible application in water quality surveillance and stream purification. Surveys of a number of streams receiving various types of pollutants are in progress to obtain information on the occurrence and distribution of myxobacteria in these habitats. The effects of environmental parameters on the myxobacterial population of water are being considered as well as the interrelationships between myxobacteria and other microorganisms present in water.

Taxonomic studies on a number of myxobacteria isolated from the aquatic habitat are in progress to permit qualitative determinations to be made on the myxobacterial flora of water. Additional studies on the nutrition and physiology of selected myxobacterial isolates are planned in order to obtain more basic information on this group of microorganisms.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0953, SEDIMENT-WATER-BACTERIA INTERACTIONS IN EUTROPHICATION

R.E. PACHA, Oregon State University, Graduate School, Corvallis, Oregon 97331

The major objective of this research is to investigate the microbial activity in lake sediments to determine the effect of this activity on eutrophication. In particular it is of interest to define the importance of bacteria found in bottom muds in the recycling of plant nutrients between sediments and overlying water. The physiological activities of various types of bacteria occurring in the bottom deposits of Upper Klamath Lake, Oregon will be studied in relation to their effect on the nutrient dynamics of the lake. This investigation will contribute to our knowledge of eutrophication and may provide insight into suitable approaches for regulating this process.

5.0955, THE AUTECOLOGY OF SOME BLUE-GREEN PLANKTON ALGAE

H.K. PHINNEY, Oregon State University, Graduate School, Corvallis, Oregon 97331

Autecological and synecological studies using both uni-algal and mixed cultures of selected species important in nuisance blooms. The study will determine 1) requirement for major and minor nutrient minerals, 2) effects of naturally occurring organic nutrients, and 3) possible biotic effects as antagonism and synergism or competition in mixed cultures.

Analysis of the effects upon growth of the factors under consideration will be by the following determinations: 1. Dry weight.

2. Percent organic matter. 3. Caloric value. 4. Pigment content. 5. Dry solids by interferometry. 6. Direct mineral analysis, and 7. Direct determination of production rates.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0956, RELATIONSHIPS OF AQUATIC FLORA TO WATER QUALITY AND POLLUTION

H.K. PHINNEY, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives are (1) to establish a continuing research program concerning the relation of the aquatic flora to quality of water supplies and to water pollution. (2) To determine by biological studies of aquatic habitats, the relation between biotic and edaphic factors that cause changes in the quality of water resources, and (3) to coordinate and extend studies in the general area of aquatic botany.

At present, effort is being directed toward three types of studies: a) the effect of water humus on the growth of algae in culture, b) the study of primary production in artificial streams under controlled light conditions, c) the study of primary production in a controlled flow woodland stream under conditions of moderate enrichment.

5.0957, SURVEY OF CLOSTRIDIUM BOTULINUM TYPE E

K.S. PILCHER, Oregon State University, Graduate School, Corvallis, Oregon 97331 (FDA)

Nontoxicogenic cultures of E-like organisms were exposed to chemical mutagenic compounds in an attempt to convert the survivors to the toxigenic form. Cultures were exposed to either 15 mg/ml of 2 aminopurine, 1 microgram/ml of azaserine, 0.05 mg/ml of acriflavine or 50 microgram/ml of 5-bromouracil. These concentrations killed 90% or more of the viable cells within an exposure time of 30 to 90 minutes. Cultures developing from the surviving cells were tested for their toxigenicity. In no instance did these chemical mutagens convert the nontoxicogenic E-like organisms to the toxigenic form. In addition to the chemical mutagens, the effect of gamma radiation on the nontoxicogenic cultures was explored. Nontoxicogenic cultures were exposed to 124,000 rads of gamma radiation in three successive radiation treatments. There was not evidence of toxigenic organisms arising from this treatment.

The feasibility of a micro scale immunodiffusion test for type E toxin shall be explored. Cultures shall be filtered and concentrated 25 to 50 fold by dialysis against a hydrophilic colloid. Concentrates shall then be tested by immunodiffusion in purified agar against very small volumes of type E antitoxin. If the method shows any promise with pure type E cultures and nontoxicogenic E-like strains, various mixed cultures from natural specimens shall be studied. Immunoelectrophoresis of concentrates may be used in a limited way as a possible means of identifying the toxic component in diffusion tests.

The infrared absorption spectra of cultures of the various types of C. botulinum prepared as thin films on the specimen plates shall be determined. Variables such as culture medium, age of culture, incubation temperature, and others that could influence chemical composition of the cells shall be controlled. The objective of this work is to explore the possibility of distinguishing between the different types of C. botulinum, and between toxigenic and nontoxicogenic cultures by means of their infrared patterns. Additional experiments shall be carried out with the objective of trying to induce the appearance of a toxin forming mutant in cultures of nontoxicogenic 'E-like' organisms. Other chemical mutagenic agents, not previously tested, shall be examined, and the effects of a single severe exposure, as well as concentration of the test compound, shall be determined.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0958, INFLUENCE OF LOG RAFTING ON WATER QUALITY

F.D. SCHAUMBURG, Oregon State University, School of Engineering, *Corvallis, Oregon 97331*

Findings of preliminary research conducted during the summer of 1967, indicate that log rafting and wet storage of logs is a potential pollution problem in rivers and estuaries (see page 10). The research proposed herein will examine the nature and extent of pollution caused by log rafting and storage practices and will provide quantitative information which can be used to assess this problem.

The overall objective is to evaluate the effect on water quality imposed by floating log rafts in estuarine and fresh water environments. The specific objectives of this project are two fold as follows: a) to evaluate the quantity, character and water pollution potential of soluble substances 'leached' from floating logs in raft storage; and, b) determination of the water quality effects caused by deposits of bark, fiber and debris that occur in the vicinity of the log rafts.

In one phase of this project, representative sections of Douglas fir and other prominent species of trees in the Pacific Northwest will be floated in water under controlled conditions of temperature, salinity and biodegradation. The water media will be monitored at regular intervals for accumulation of total organic carbon, BOD, COD, PBI compounds, carbohydrates and others. Bioassay tests will be conducted by cooperating biologists to evaluate the relative toxicity of leached substances.

The significance of benthic deposits in the vicinity of log rafting and raft storage areas on water quality will be determined during the second phase of this project. Bark and wood fragments are broken loose from logs during log dumping, raft construction, raft storage and related operations. Much of the material is lost in log raft storage areas due to the abrasive action between logs imparted by tidal motion.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0959, LIGNIN SULFONATES IN PULP MILL EFFLUENTS

H.A. SCHROEDER, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

Objectives: To add to the knowledge of the chemical structure of lignin sulfonates, a principal component of sulfite pulp mill effluents. To isolate, identify, and determine the structure of the low-molecular-weight lignin sulfonates present in the spent liquor from the sulfite pulping process. Individual lignin sulfonate monomers and dimers are to be completely characterized. Structures are to be proved by comparison with synthetic known compounds prepared in the laboratory.

Abstract of Procedures: The spent sulfite pulping liquor usually can be obtained as a dry powder. Using this powder as column packing, the low-molecular lignin sulfonates can be removed by eluting with methanol, moistened ethanol, or other solvent systems known to elute the desired material. The low-molecular-weight lignin sulfonate fraction will be analyzed by paper chromatography or by thin-layer chromatography. As a result of the evaluation of the chromatograms, individual substances will be isolated and purified. Ion exclusion column chromatography, paper column chromatography, and ion exchange column chromatography will be employed for the separation and purification of individual lignin sulfonates. The isolated and purified lignin sulfonate can be characterized to a considerable extent through ultraviolet spectroscopy. The synthesis of the suspected lignin sulfonate will afford positive identification.

5.0961, EFFECTS OF PULP MILL EFFLUENTS ON THE GROWTH AND PRODUCTION OF FISH

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

The general objective of the proposed research is to develop principles and methods of determination of the limits of acceptable water quality change in streams receiving industrial effluents, particularly change that influences fish populations valuable to man. This is to be done by experimentally determining how and to what extent kraft process pulp mill wastes at concentrations that are neither acutely toxic nor severely oxygen-depleting influence the growth of fish in laboratory aquaria and receiving the streams and fish production in laboratory and outdoor artificial streams. The rates of food consumption and the efficiency of utilization of food for growth by salmonid fishes and changes in rates of production of their principal food organisms under the controlled experimental conditions will be determined and the findings related to field observations to be made on rivers receiving kraft mill wastes.

5.0962, DISSOLVED OXYGEN REQUIREMENTS OF FRESHWATER FISH

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

The long-term objective of this research is to provide the knowledge necessary for developing oxygen standards that are adequate to insure fish production in fresh waters will not be impaired by the introduction of excessive amounts of oxygen-depleting wastes. Before the results of laboratory research can be relied on for developing sound dissolved oxygen standards, results obtained under the relatively simple and biologically undemanding conditions of laboratory experiments must be interpreted in light of the results of studies of fish under more complex and biologically demanding conditions, such as those found in natural stream and pond environments. This research, in contrast with most previous experimental studies, will be more directly concerned with the influence of dissolved oxygen on the growth and activities of fish in their natural environments.

Our problem is to determine what reductions in dissolved oxygen in natural environment can measurably reduce the growth rates of fish below rates that would occur were oxygen not limiting, when the fish must expend energy to capture their food and utilize it for growth and maintenance and to carry on other normal activities under natural conditions. The problem can be separated into two distinct parts: (1) to determine the quantities of food fish consume in natural environments and the amounts of energy required for obtaining and utilizing this food, as well as for carrying on other normal activities; and (2) to determine the levels of dissolved oxygen at which fish would be unable to mobilize the energy necessary for obtaining and utilizing food in these amounts. Our approach involves complementary studies of fish in natural environments, in artificial streams and ponds, and in the laboratory, coordinated in such a manner as to exploit the strength of each kind of study.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.0963, ECOLOGICAL STUDIES OF AN EXPERIMENTAL STREAM

C.E. WARREN, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

Changes in streams, whether due to natural causes or the activities of man, bring about changes in the pathways by which energy from its various sources reaches organisms of interest to man. For about twenty years, biologists have been studying the pathways of energy transfer and efficiencies with which energy is transferred through aquatic communities. Because of the complexity of most biological communities, these studies have not progressed far. Nevertheless, certain of the approaches and methods that have been used in such studies have promising application in the solution of water pollution problems. The general objectives for our studies are (1) to identify key relationships between important organisms and their environments and determine how these are affected by pollutional changes, and (2) to find or develop and test practical approaches, parameters, and methods for utilizing these relationships in the solution of water pollution problems.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0964, PHARMACOLOGICAL AND ECOLOGICAL EFFECTS OF PESTICIDES

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

It is the overall objective of this broad and fundamentally oriented research project to provide, through studies of the pharmacological and ecological effects of pesticides and other toxic substances on freshwater organisms, information which will be of value in developing standards for the use of toxic substances that are adequate to protect the productivity of fresh waters for organisms of value to man. The production of an organism cannot be expected to remain unimpaired if environmental changes reduce its ability to survive, reproduce, grow and move, or if the production of its food organisms is reduced.

The following general objectives must be attained before the overall objectives of this research can be realized; (1) obtain understanding of how toxic substances influence the various biological functions of the individual organism; and (2) obtain understanding of how toxic substances influence food relations in biological communities.

The following general procedures will be used in attaining the objectives of this research: (1) classical pharmacological and bioenergetic approaches will be used in laboratory studies of the influences of toxic substances on the biological functions of aquatic organisms; and (2) food chains in simplified biological communities in the laboratory and in complex communities in nature will be studied to determine the influence of toxic substances on food relations.

5.0965, INFLUENCES OF WATER QUALITY AND OTHER ENVIRONMENTAL CHANGES ON FISH AND ASSOCIATED ORGANISMS IN INLAND WATERS

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Influences of Water Quality and other Environmental Changes on Fish and Associated Organisms in Inland Waters.

It is the first objective of this rather broad project or program to provide fundamental understanding of the influences which generally occurring environmental changes have on fish and associated organisms in inland waters. The domestic, agricultural, forestry, industrial and other activities of man are continually changing the character of our inland waters and endangering their social and economic value. Understanding of the influences of these changes, to be of much scientific or social value, must be in terms of the ecology of the individual organism, its population and its community.

It is the second objective of this project to provide, where possible, methods by which understanding of ecological changes may be applied to the solution of problems arising when the activities of man endanger valuable aquatic resources.

Laboratory and field studies of physiological and ecological nature will be utilized in approaching problems selected because of their generality.

SUPPORTED BY Oregon State Government

5.0966, EFFECTS OF KRAFT PULP MILL EFFLUENTS ON THE GROWTH AND PRODUCTION OF FISH

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

The general objective of this work is to determine how and to what extent concentrations of kraft pulp mill wastes that are neither acutely toxic nor severely oxygen depleting may influence the production of fish populations.

Description of Work: (1) Determine the influence of effluents from kraft pulp mills on the growth of juvenile salmonids in the laboratory when food consumption rates and metabolic requirements of the fish are similar to those of fish in nature. (2) Determine the influence of effluents from kraft pulp mills on the food consumption, growth, and production of salmonids and on the production of their food organisms in simplified biological communities in laboratory streams. (3) Determine the influence of kraft mill effluents on the food habits, food consumption, growth, and production of salmonids, and on the biological communities of controlled experimental streams in which the concentrations of these wastes are controlled at levels below those known to be toxic or seriously oxygen depleting. (4) Determine through sampling studies above and below the points of entry of kraft pulp mill effluents into rivers the food habits and growth rates of salmonids and other fish.

5.0967, SOIL STABILIZATION AND RUNOFF REGULATION IN CONIFER WATERSHEDS

J.S. ROTHACHER, U.S. Dept. of Agriculture, Corvallis, Oregon

Object: To determine how logging methods, road construction, and timber management practices can be improved to curtail erosion, prevent channel impairment, and regulate quantity and timing of runoff.

Plan of work: The project will continue to (1) measure soil movement on logged land and logging roads; (2) determine effects of road building, cable logging, forest removal, and slash burning on water quality; (3) investigate changes in streamflow caused by clearcutting and partial cutting; and (4) determine the role of vegetation on evapotranspiration. The project will begin new studies to include: (1) relating soil movement to soil, topographic, and vegetative factors; (2) development of erodibility indexes; (3) measurement of rate and quantity of subsurface water movement; and (4) determination of the hydrologic values of humus.

SUPPORTED BY U.S. Dept. of Agriculture

5.0968, FATE AND EFFECTS OF PESTICIDES IN FOREST SOILS AND WATER

R.F. TARRANT, U.S. Dept. of Agriculture, Corvallis, Oregon

Object: To determine how the unique properties of forest soil are affected by insecticide and herbicide residues and lead to their alteration and degradation; to determine how much and in what form residues are present in water coming from forest lands; and to devise guides for safe use of these pesticides in the forest.

Plan of work: The projects staff will continue to study (1) the litter production of alder and conifer stands in Oregon, (2) the movement of insecticides in soil and soil water, and (3) the disposition of DDT from a 55,000-acre spraying. They will initiate studies on (1) relationship between residues and soil micro-organisms, (2) residue movement across and through the soil, and (3) effect of residues on forest soil development.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Dept. of Agriculture
University of Maine

5.0969, EUTROPHICATION - EFFECT OF FLOW AUGMENTATION

A.F. BARTSCH, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The immediate objective is to determine the effect on algal bloom production when a nutrient-rich lake is flushed with nutrient-deficient water. Ultimate objective is to decrease or eliminate algal blooms in Moses Lake, Washington. One of three branches of the lake will be flushed with low-nutrient water while the others remain as controls. After flushing during August and September, 1968, a year of no water diversion will follow to permit determining persistence of improvement. This approach will evaluate flushing as a remedial tool and will indicate the periods of future water diversion needed to permanently prevent bloom formation. Principal parameters to be investigated are as follows: 1. Water current studies at selected sites and depths. 2. Water budget studies to determine extent and efficiency of flushing. 3. Turbidity measurements and suspended solids analysis. 4. Chemical and physical parameters to determine existence and character of thermal stratification and also environment for algae. 5. Qualitative and quantitative determination of algae, including measurements of phytoplankton pigments, biomass, and species diversity. 6. Chemical analyses and oxygen demand studies of bottom muds.

Basic data collection and analyses will be conducted cooperatively by FWPCA and University of Washington personnel. Other cooperators will be the Bureau of Reclamation and a citizens group in the city of Moses Lake, Washington.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0970, EUTROPHICATION - EFFECT OF WEED HARVESTING

A.F. BARTSCH, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The principal objective is to evaluate aquatic vegetation harvesting as a means of effectively reducing algal nutrient availability. Harvesting and removal of aquatic vegetation is one of the potential control measures in combating eutrophication of bodies of water. It is a means of 'cropping off' part of the excess nutrients. Although weed harvesters have been used in the past, no really scientific investigations have accompanied their use. In cooperation with the Pelican River Watershed District, Minnesota, city of Detroit Lakes, and University of North Dakota the effectiveness of the procedure will be evaluated. Attempt will be made to answer such questions as: 1. What is the amount of nutrients actually removed from a lake by weed harvesting? 2. What happens to the energy flow of nutrients that originally went into the plant growth? 3. What is the pattern of regrowth of the vegetation after harvesting and do other species replace the original ones? 4. Does the phytoplankton population change after the higher aquatic plants are removed?

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0971, EUTROPHICATION - BIOLOGICAL CONTROL USING GRAZERS

A.F. BARTSCH, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The objective is to determine if living organisms can be found which will harvest nuisance algae through grazing, or reduce them through disease and parasitism. A literature review will be made to determine the prospects for success and to identify North American or other species as prospective candidates for grazing trials. Promising animals will be evaluated in the laboratory or field as appropriate.

It was the consensus of most scientists attending the recent International Eutrophication Symposium in Madison, Wisconsin that this is a potentially fruitful area of research. It was felt that a biological control measure for algae could be found if sufficient effort were expended. This has not been done to date.

Much of the effort in F. Y. 1968 will be desk work to learn what has been done by other researchers and to determine who might be interested in doing work with grant research funds. Other activities will include preliminary laboratory evaluation of grazer candidates.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0972, EUTROPHICATION - PHYSICAL ECOLOGICAL CONTROL

A.F. BARTSCH, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The objective is to determine if algal production can be inhibited by preventing thermal stratification of a lake. Prior destratification experiments have sometimes decreased and other times increased primary production. Because of this seeming paradox, it is necessary to understand this phenomenon and to utilize it if possible, as a means of preventing algal bloom formations. If total algal growth can indeed be retarded by mixing, it is necessary to learn if a lake has to be turned over every year or at lesser or greater intervals to give permanent relief.

Principal areas of investigation will include: 1. Measurements of water movements at selected sites and depths in a lake. 2. Measurements of chemical and physical parameters that are of importance to algal growth. 3. Measurements of algal growth.

5.0973, COASTAL DIFFUSION OF POLLUTANTS

D.J. BAUMGARTNER, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The Georgia-Pacific Corporation, Toledo, Oregon currently discharges its kraft process pulp mill wastes to an ocean outfall which discharges approximately 6 million gallons per day through a diffuser section at a depth of 40 feet at a distance of 3000 feet off the Oregon Coast at Newport. The dilution achieved by the diffuser process and by the horizontally flowing field under the influence of natural forces will be investigated by frequent sampling of the near coastal waters, plus continuous monitoring of wind direction and speed. Current meters will be installed at various depths and at three locations in the near shore area to determine the relationship between the dilution of the field and the current structure. Additional surface current measurements may have to be made on the basis of drift cards or dye fields. Model tests will be performed in an 8-foot diameter, 3-foot deep tank to reproduce the hydrodynamic characteristics of the diffuser port and the density structure or the wind stress. This should, in addition to improving the methodology for describing jet diffusion, provide a method for estimating the influence of the non-steady current structure in the receiving fluid by comparing the observed performance in the prototype with the observed performance in the controlled model.

5.0974, ESTUARINE DIFFUSION OF POLLUTANTS

D.J. BAUMGARTNER, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The most general characteristic of pollutants which plays a part in the assessment of their fate is concentration. Since the concentration is a function of its dilution in the environment as a result of mixing and diffusion, as well as decay of the component, it is of considerable importance to be able to determine how the concentration of a pollutant will vary in the receiving water at various locations and perhaps at various times if the pollutant or the environment is not in steady state.

Uncertainty exists with regard to the value of the turbulent diffusion coefficient to be used in problem analysis. To provide a means of determining this value at points in time and space, as well as providing additional understanding of the forces which influence estuarine diffusion, a predictive model of salinity will be constructed on the basis of time series analysis of observations in Yaquina Bay, Oregon.

Continuous recording salinometers will be installed approximately every five miles along Yaquina Bay to obtain the record of the time variation of salinity at the surface. Once a week, vertical

5. WATER QUALITY MANAGEMENT AND PROTECTION

traverses of salinity will be obtained to provide information on the vertical stratification in the estuary. If necessary, additional salinometers will be placed near the bottom to obtain information on the vertical distribution. Fresh water inflow will be estimated by stream gauging of the three principal surface streams in the area. Direct runoff and direct rainfall can be estimated. Information on tide height and frequency will be obtained from three tide gauges, while continuous information on wind speed and direction will be obtained at the entrance to the bay and other locations if necessary.

5.0975, MARINE BIOLOGICAL ASSESSMENT OF POLLUTIONAL FATE

D.J. BAUMGARTNER, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

In almost every pollution situation, a major consideration is the impact of the degraded water quality on the organism. This is especially true where it is suspected that the pollutant will harm aquatic organisms of primary importance to man. Interpretation of bioassay tests is complicated by the fact that there has been very little information obtained to relate the controlled observations in the laboratory experiments to the actual conditions existing in the environment in the absence of pollution. Attempting to overcome some of these difficulties, investigators have begun to consider and apply in situ bioassay procedures.

The difficulties associated with this approach are related to selection and maintenance of the test animals, knowledge of their population dynamics in the natural unpolluted environment, and determination that the observations obtained under the test conditions are due to a pollutional stress rather than artifacts of the experimentation.

The first step in developing a series of procedures for analysis of problem areas is determining the amount and type of information necessary to describe the natural environmental populations. This developmental work is being tried on Yaquina Bay, Oregon, along two approaches.

Information on fish usually associated with bottom or mid-water habitat will be obtained at each of ten sampling stations every two weeks by means of a trawl. Continuous recording of salinities on the surface at six stations covering the trawl areas will also be provided. In addition, weekly profiles of dissolved oxygen, temperature and salinity will be provided. Samples will be obtained for organic carbon analysis or PBI's or other appropriate analyses to determine possible pollutants. It will be possible to test some of the methods of analysis after collection of data for one year. The second method of observation pertains to collection of crustacea in standardized substrate boxes and on substrate media suspended in the water column. These samples are analyzed after exposure to the environment for five weeks. Sub-samples of the organisms obtained in both methods will be analyzed for maturity, weight distribution, and stomach contents.

5.0976, PHYSIOLOGICAL EVALUATION OF TREATED TOXIC WASTES

G.R. BOUCK, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

The project seeks to evaluate the needed degree of waste treatment for Paper Trade Wastes. Various life stages of Pacific Salmon and steelhead trout are the test organisms and these are exposed to the above wastes for thirty days or more using continuous renewal of toxicant. Physiological tests include histopathology, autofluorescence of tissues, protein composition of plasma and tissues, enzymes in plasma and routine hematology.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0977, SLIME CONTROL ASSOCIATED WITH PULP MILL EFFLUENTS

M.D. KNITTEL, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

The purpose of this investigation is to learn the minimum requirements of nutrients that support the growth of *Sphaerotilus natans*. Further, the project plans to define the carbon and nitrogen source that supports growth of this bacterium. This information will be helpful to those who must design effective waste treatment methods for industrial wastes.

A second major area of this project is to find, test and develop effective biological control methods for *S. natans*.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0978, MICROBIOLOGICAL TREATMENT OF POTATO WASTES

D.S. MAY, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

In order to better understand the role of microorganisms in the biological treatment of potato processing wastes, several areas will be investigated. The processing waste streams will be characterized to determine chemical constituency with respect to nutrients, organic materials, and trace materials. Attempts will be made to isolate and identify the predominant organisms existing in present treatment systems and determine their role in stabilization of the waste. Using bench-top treatment chambers the growth of these organisms and the conversion of the waste will be followed closely by chemical and biochemical analysis. Organisms which provide good decomposition will be further studied under the influence of nutrient additives which may enhance microbial activity. The feasibility of including cultures of highly active microorganism will be investigated. Consideration will be given to the development of biological flocs which may be recovered from the system and used as food material for livestock.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0979, CHEMICAL AND ENGINEERING ASPECTS OF POTATO PROCESSING WASTES TREATMENT

L.J. NIELSON, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

This investigation will evaluate the several potato processing wastes for treatment both as separate wastes and as a combined flow. Emphasis will be on increasing efficiency of waste treatment for protection of receiving waters and for reduction of treatment costs. Research will consider possible by-product recovery by use of polyelectrolytes and/or pressurized air flotation. The economics of dehydrating potato starch wastes for recovery of a useable product will be examined.

5.0980, PULP AND PAPER WASTE CONTROL AND TREATMENT

R.H. SCOTT, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

Development of State of Arts Document covering principal segments of pulp and paper production, in-plant control and treatment for waste reduction, processes in-plant leading to destructive disposal, or utilization and by-product development. Consideration of available means for waste salvage for re-use, water conservation and in-plant concentration and distribution of waste fraction in weak waste streams. Review of present knowledge regarding waste treatment technology as practiced in the industry.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0981, EUTROPHICATION - PILOT OPERATIONS

L.P. SEYB, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, *Corvallis, Oregon 97330*

As laboratory scale techniques are found for the control of algae in lakes, methodology must be developed for the scale-up of these techniques to use in field trials. Techniques of systems analysis and economics will be used in shifting from small scale to full scale demonstrations. It is an objective to plan the groundwork for this development.

5. WATER QUALITY MANAGEMENT AND PROTECTION

It is anticipated that an engineer will be employed during the last quarter of F. Y. 1968 to work with personnel assigned to sub projects in the eutrophication program.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0982, EUTROPHICATION - SEDIMENT-WATER INTERCHANGE STUDIES

L.P. SFYB, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

Objectives are to determine mechanisms, rates and conditions by which algal nutrients in lake sediment interchange with overlying water and to treat lake sediment to prevent interchange. Sediment will be removed from the lake and tested for its nutrient release capacity in the laboratory. While most ion exchange work on soil has been done with cations, techniques for this do not take into consideration the possibility of anion exchange with humic and other materials present in organic soils. Ion exchange capacity of lake sediment with reference to anions containing phosphorus and nitrogen will be examined. Because the amount of humic acids in bottom deposits is a measure of the degree to which organic substances are stabilized in sediment and since dehydrogenase content of sediment is a measure of the extent of biological breakdown of organic substances, both parameters will be measured. Also, we may measure the vitamin B12 content since it has been proposed that this vitamin results from bacterial action in sediment.

Small areas of Klamath Lake which have shown dense algal blooms in past years will be isolated from the main body of the lake and used to determine the influence of sediment-water interchange on algal production and to evaluate procedures intended to prevent or impede interchange.

5.0983, POWER PRODUCTION

B.A. TICHENOR, U.S. Dept. of Interior, Pacific Nw. Water Laboratory, Corvallis, Oregon 97330

The project staff acts as a 'core group' for coordinating the FWPCA's national research effort in the area of thermal pollution resulting from power production. Two activities are presently underway: 1. Development of a mathematical model and associated computer program for the prediction of water temperatures in the Columbia River from Grand Coulee Dam to Bonneville Dam. 2. Preparation of a 'state of the arts' document describing the present and future problems, present and proposed solutions, and research needs in the area of thermal pollution from power production, with special emphasis on nuclear power plants.

Future plans include either 'in-house', contract, or grant research in the areas of: 1. Reservoir temperature prediction techniques (including stratification, density currents, release temperatures, design considerations for multiple level outlets, operating schedules for optimum downstream thermal conditions, etc.). 2. Dispersion of heat from power plant heated effluent outfalls, 3. New designs for cooling apparatus for thermal power plants, including improvements in methods such as cooling towers, cascades, sprays, cooling ponds, etc., 4. New operating methods or design changes for thermal power plants to produce cooler effluent, 5. Effect of heat on the biological, microbiological, and chemical quality of water.

5.0985, MASS MORTALITY OF OYSTERS ALONG THE OREGON COAST

C.D. SNOW, State Fish Commission, Portland, Oregon 97201 (14-17-0001-1895)

Summary of Proposed Work: The Oregon Fish Commission is continuing the oyster mortality monitoring program begin in 1966 with slight changes to conform with the recommendations of the team of experts which reviewed the program in 1968. Sampling stations will be maintained in Tillamook, Yaquina and Coos Bays.

In Yaquina Bay, the number of sampling stations will be reduced from six to three to permit more intensive monitoring of both native and Pacific oysters. Observations will be made every two weeks, and samples will be collected every 4 weeks. Those and dead or abnormal oysters will be sent to the University of Washington for histological examination.

In addition to the sampling stations in Yaquina Bay, an observation station will be established at the dock of the Marine Science Center. Observations will be made each working day. Dead or moribund animals will be collected for histological examination.

There will be one station at Tillamook and Coos Bays. Sampling will be monthly with collections for histological examination from the control lots and the adjacent beds.

Water quality measurements at Yaquina Bay will include temperature, salinity, dissolved oxygen and turbidity plus supplemental information from the Federal Water Pollution Control Administration and Oregon State University. At Tillamook and Coos Bays measurements of temperature, salinity and dissolved oxygen will be taken during each sampling visit.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

5.0986, MOVEMENT OF RADIONUCLIDES IN THE COLUMBIA RIVER ESTUARY

D. HUBBEL, U.S. Dept. of Interior, Geological Survey, Portland, Oregon 97208

Two reaches of the estuary have been instrumented for discharge determination. These will be calibrated by direct measurements of flow from a boat at different stages and through several tidal cycles during the coming year. The data will then be fitted to a one dimensional mathematical model that has already been developed. If the mathematical model is determined to be reasonably accurate, two other reaches will be instrumented similarly. In addition water samples for salinity and other chemical characteristics and sediment content will be taken during all direct discharge measurements. Gross description of radioactivity in the estuary will be obtained by a sled mounted in situ radiation detector as well as from analyses of water and sediment samples. Data compilation and integration will be augmented by a study of typical environments such as islands, tidal flats and shorelines, which can be mapped fairly easily. The mechanics of sediment transport and deposition particularly under the influence of salinity changes and flow reversal will be studied to define empirical relations to be used in calculating sediment loads. The project was initiated in FY 1964 and is expected to be completed in FY '69.

5.0987, EFFECT OF SURFACE GROUPS ON ADSORPTION OF POLLUTANTS

R.W. COUGHLIN, Lehigh University, School of Engineering, Bethlehem, Pennsylvania 18015

Activated carbon is the most promising material which has been investigated for adsorbing biologically undegradable organic compounds from waters and waste waters. Of the many different commercially available carbons which have been used for these studies, some have shown markedly higher adsorptive capacities than others (two to three times on a per-gram basis). Presumably, these differences are due to varying specific surface areas, varia-

5. WATER QUALITY MANAGEMENT AND PROTECTION

ble types of surfaces and different functional groups on the solid surfaces. It is proposed herein to investigate the influence of type of surface and nature of functional groups on the surfaces as they affect the adsorption of typical biologically undegradable organic compounds on activated carbon and on other promising adsorbents. The ultimate goal of this research will be to identify those functional groups and surfaces which are most efficacious for adsorbing specific compounds. This information will indicate how better materials can be designed for specific adsorption tasks, provide expanded and better means of surface regeneration and establish guides for selecting solid adsorbents to achieve a particular adsorption goal.

5.0988, TRANSPORT OF SOLID SUSPENSION IN CONDUITS

W.H. GRAFT, Lehigh University, School of Engineering, Bethlehem, Pennsylvania 18015

This proposal results from ideas formulated by the principal investigator during work on the project, 'The Transport of Solid Suspension in Conduits', sponsored by the Federal Water Pollution Control Administration of the U. S. Department of Interior (research grant - WP-00838). Essentially, this proposal outlines further research to be done as a continuation of the present project. The research will be divided into two parts: (1) Design criteria for minimum transport velocities of non-depositing solid - liquid mixtures in pipe lines will be investigated. Only recently, the progress report of ASCE's Combined Sewer Separation Project points out a complete lack of data in this area. The proposed research will try to provide a modest contribution to adequate combined-sewer design, focusing primarily on suspended pressure conduit. (2) Further development of the modified Venturi meter to measure mixture flow rate and concentration simultaneously is suggested.

It is believed that the proposed research will provide further knowledge about the design of conduits transporting solid - liquid mixtures.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.0989, THERMAL AND INDUSTRIAL POLLUTION DELAWARE RIVER

B.W. PARKER, Lehigh University, Graduate School, Bethlehem, Pennsylvania 18015

In the seven mile stretch of the Delaware River from Riegelsville, N. J. down to river Milford, N. J., there are four paper mills which produce variable discharges into the river. About half way between these two limits is a steam-electric generating station which discharges heated water from condensers. At full capacity this station is generating 134 Megawatts. This corresponds to a waste heat rejection of about 6.7×10 to the 8th power B.T.U. per hour.

We propose to operate automatic monitoring stations at the bridges at Riegelsville and at Milford to develop comparative data for the river above and below the areas of cited pollution. Five diagnostic parameters would be recorded: Oxygen, Turbidity, pH, Conductivity and Temperature. Sunlight intensity at Riegelsville is useful as the primary index of photosynthesis and oxygen production. The automatic Water Quality Monitor Station at Riegelsville was developed and operated by Lehigh from 1958-61 under agreement with INCODEL. We also developed a portable monitor station which records the five parameters.

The Del. Riv. Basin Comm. has succeeded INCODEL in ownership of the monitor equipment. DRBC plans to reactivate the Riegelsville Monitor Station and to let us use the portable monitor station for this proposed research.

In addition to collection of information by automatic instrumental methods, we would employ standard field sampling methods such as: a. Collection of microscopic plants and animals by Millipore filter and immersion slide techniques; b. Observation of macroinvertebrates and determination of distributions in terms of types and relative abundance; c. Observation of distributions and types of rooted aquatic plants and algae; d. Measurement of Temperature and Sampling for B.O.D., C.O.D. and bacteriological counts.

5.0990, PILOT PLANT DEVELOPMENT OF THE ION-EXCHANGE PROCESS FOR RECOVERY OF AMINO COMPOUNDS FROM POTATO STARCH FACTORY EFFLUENTS

W.L. PORTER, U.S. Dept. of Agriculture, Chesnut Hill - Philadelphia, Pennsylvania 19118

Object: To alleviate the problem of disposal of secondary wastes from potato starch factory effluents and reduce stream and air pollution; to obtain a cost estimate for the process; and to produce crude amino acid mixtures.

Plan of work: An evaluation will be made by pilot plant scale of the methods of recovery of free amino acids from potato starch plant effluent by ion-exchange treatment. The investigation will include: effect on process of variation in concentration of in-put solids from 0.5 - 3.0% solution; applicability of Dutch process for recovery of protein before ion-exchange treatment of effluent liquor; degree of clarification required before ion-exchange processing; disposal of solutions from regeneration of columns and selection of regeneration acid from this viewpoint; methods of stabilizing the amino acid product; and determination of composition, BOD and COD of effluent stream before and after processing. Cost estimates will be provided based on the data and final process layout, for a full-scale plant to recover nitrogen-containing materials from the 'protein water' effluent of a 10 ton per day and a 30 ton per day potato starch factory. A minimum of 500 pounds of dry crude amino acids will be delivered representing the typical product of the process for use in utilization studies and market development.

SUPPORTED BY U.S. Dept. of Agriculture

5.0991, INVESTIGATION OF SOAP-DETERGENT COMBINATIONS BASED ON INEDIBLE ANIMAL FATS

A.J. STIRTON, U.S. Dept. of Agriculture, Chesnut Hill - Philadelphia, Pennsylvania 19118

Synthesis of the different types of surface active agents will be explored, including the anionic, nonionic, cationic and amphoteric types, with greatest attention to the anionic and nonionic. The synthesis from tallow of surface active agents with increased solubility is a major objective. This may be reached in the form of sulfated, sulfonated or phosphated nonionics. Oxyalkylation and subsequent sulfation and phosphorylation will be investigated, starting with long chain fatty acids, alpha-sulfo acids, alcohols, amides and amines and epoxides.

Other reactions will include the alpha-sulfonation of nitriles, amides and dicarboxylic acids, the synthesis of alkanolamides and related nitrogen containing compounds. New surface active types will be investigated in a preliminary manner for relative ease of biodegradation before any commitment to an extensive program of synthesis and evaluation.

Detergents and surface active agents will be examined for aqueous solubility, conveniently measured by the Krafft point or cloud point, solubility in organic solvents, stability to hydrolysis and stability to calcium ion and heavy metal ions.

The work will include the formulation of solid and liquid detergent bars and soap-syndet combinations. Special attention will be given to the possible elimination of phosphate builders.

SUPPORTED BY U.S. Dept. of Agriculture

5.0992, BIODEGRADABLE DETERGENTS FROM ANIMAL FATS

A.J. STIRTON, U.S. Dept. of Agriculture, Chesnut Hill - Philadelphia, Pennsylvania 19118

Object: To develop new and expanded outlets for animal fats through studies on the biodegradability of alpha-sulfo acids and derivatives therefrom which have surface active properties.

Plan of Work: Biodegradability of detergents based on alpha-sulfo tallow acids will be studied by such recognized methods as the River Die Away test and continuous sludge digestion. Biodegradability sewage data will also be obtained on other derivatives of tallow which offer promise as detergents as well as on important competitive materials such as alkylbenzene sulfonate (ABS) and straight chain ABS. Continuous attention will also be given to the possibility for improving and standardizing

5. WATER QUALITY MANAGEMENT AND PROTECTION

the methods for measuring biodegradability or for the development of new methods for the purpose. Isolation of the intermediate products of the biodegradation of fat-based detergents may be undertaken in order to learn as much as possible about the actual mechanism of biodegradation. Finally, since so much of our detergents are disposed of through cesspools or septic tanks, attempts will be made to study the biodegradation of fat based detergents under anaerobic conditions.

SUPPORTED BY U.S. Dept. of Agriculture

5.0993, ESTIMATING ACID MINE DRAINAGE POTENTIAL FROM COAL BEDS BY USE OF THE SOXHLET EXTRACTOR

G.H. EMRICH, State Dept. of Health, Harrisburg, Pennsylvania

Acid mine drainage degrades many miles of streams in the coal mining regions of the United States. In order to properly design treatment facilities for acid mine drainage, the character of the mine drainage must be known before mining begins.

While many tests have been proposed, very few, if any, reproduce the natural conditions that produce acid mine drainage which this study will do. The study uses a Soxhlet Extractor packed with inert material and crushed coal. Distilled water is passed over the coal sample which is constantly being aerated. When the Soxhlet Extractor is filled with water, the water siphons back through a flask and is recirculated through the coal again. After four complete passes the fluids are analyzed for acidity or alkalinity, sulfate and iron. This is continued for a sufficient number of passes until the character of the mine drainage can be estimated. Preliminary results show close correlation of drainage from existing coal mines and estimated character of mine drainage.

Continuing research will also be performed to evaluate the effects of temperature, bacteria and sample size.

SUPPORTED BY Pennsylvania State Government

5.0994, CONSTRUCTION OF MINE WATER TREATMENT PLANT AT HOLLYWOOD, PENNSYLVANIA

D.R. MANEVAL, State Dept. of Mines & Min., Harrisburg, Pennsylvania 17120

This project consists of the construction of a 500,000 gallon per-day acid mine water neutralization treatment plant and a program of experimental operations to evaluate performance and costs. The plant will have capability for five different process options.

Tests will be conducted to determine plant capacity and to evaluate the process elements such as flash mixing, settling, sludge disposal, sludge handling, filtration, influence of pH, effectiveness of catalysts, microbiological oxidation of iron, corrosion, and sludge scaling.

Pennsylvania State Government

5.0996, USE OF LATEX AS A SOIL SEALANT TO CONTROL ACID MINE WASTE DRAINAGE

D.R. MANEVAL, State Dept. of Mines & Min., Harrisburg, Pennsylvania 17120

This project will demonstrate the use of low cost rubber latex to form an effective soil seal which will prevent or reduce acid mine drainage without interfering with vegetative growth. The method consists of allowing a rubber latex to leach into the soil below the root line and then coagulating it either by the natural acid reaction of the soil or by an artificial acid plateau.

The seal will prevent surface water from leaching into abandoned mines and will restore normal surface runoff in the immediate area. The underground pools of contaminated water which presently exist because of uncontrolled seepage from above will remain static or eventually dry up, thus eliminating acid drainage into lower streams and rivers.

5.1003, MICROTRAINING PILOT TESTS OF STORM WATER OVERFLOWS FROM COMBINED STORM AND SANITARY SEWER SYSTEMS E.W. DIAPER, Glenfield & Kennedy Inc., King of Prussia, Pennsylvania 19406

Project Goal - determine the feasibility of microtraining an chlorination and/or ozonisation as a treatment process for storm water overflows from combined storm and sanitary sewer systems. The drainage area for this test is a 13.6 acre residential section surrounding 67th & Callowhill Streets, Philadelphia, Pennsylvania. During overflows, a 200 gpm sample will be extracted from a collection trough at the sewer outfall, and all water extracted will pass through the Glenfield & Kennedy Microstrainer. This is a rotary drum filter, 5 ft. diameter by 3 ft. long, fitted with a stainless steel screening fabric, having 35 micron apertures. Strained water will be chlorinated (up to 50 ppm) and collected in 1000 gallon tank for subsequent ozonisation. Samples will be automatically extracted before and after microtraining; after chlorination, and after ozonisation. Samples will be stored in refrigerated containers until collection and testing by the Philadelphia Water Commission, for pH, solids content, and biological and chemical properties. This process offers continuous, high volume processing and would eliminate the need for large volume storage tanks for storm water collection.

5.1004, SULFIDE TREATMENT OF ACID MINE DRAINAGE R.A. GLENN, Bituminous Coal Research Inc., Monroeville, Pennsylvania

This project involves laboratory process studies on the recovery of sulfide reagents from sludge, production of sulfides from coal refuse material and optimization of various unit operations. Engineering and costs evaluation of the system projected to full industrial scale operation will be made. If these evaluations are favorable, a pilot plant and later a demonstration plant may be considered.

5.1005, COMBINED SEWER STUDY FOR WASHINGTON, D.C. J.A. DEFILIPPI, Roy F. Weston Incorporated, Newton Square, Pennsylvania 19073

The study has three main objectives: 1. To define the quantity and quality of combined sewer flows by field measurement, laboratory analyses, and desk top studies. 2. To perform studies of high rate filtration as a means of treating combined sewer flow. 3. Study alternative methods of solution such as tunnel storage, surface storage, and system modifications.

5.1006, BIOLOGICAL TREATMENT PILOT PLANT AND SLUDGE DISPOSAL FACILITY W.E. HOOVER, Roy F. Weston Incorporated, Newton Square, Pennsylvania 19073 (14-12-167)

The scope of work of this contract requires the Designer to: A. Complete a detailed design of a dual stream 100,000 gpd per train biological treatment pilot plant as described in the attached specifications. B. Design a sludge disposal facility for the above pilot plant which includes: 1. Sludge dewatering systems which include: a. vacuum filtration b. centrifugation c. one other dewatering method to be determined. 2. Sludge incineration. C. Provide cost estimates for construction of scaled up plants of the above basic design with the following capacities: 1. One dual stream plant of 250,000 gal per day capacity per train 2. One dual stream plant of 500,000 gal per day capacity per train.

5.1008, FACTORS AFFECTING THE STRUCTURE OF DIATOM COMMUNITIES R. PATRICK, Acad. of Nat. Sci. of Phila., Philadelphia, Pennsylvania 19103

5. WATER QUALITY MANAGEMENT AND PROTECTION

The program of research being carried out with the aid of grant WPa00475-04 is to study the effect of various environmental factors on the structure of diatom communities. To date these studies have been concerned with the effect of nitrogen (as NO_3 or NH_4) and phosphorus (P as PO_4) in various amounts and combinations. Also the effects of these chemicals in the presence of various concentrations of iron, silica, glucose, manganese, and cobalt have been studied. The effects of various pH concentrations have also been determined.

These experiments have been carried out under semi-laboratory conditions. A portion of a natural river with its diatom flora flows through experimental boxes in a greenhouse. The flow and concentration of the chemical being studied are carefully controlled and monitored by chemical analyses. The general chemical characteristics of the river water are determined at frequent intervals, some of them being daily determinations. The general characteristics of the experiments have been developed so that under natural conditions 95-97% of the specimens compose the same species in each of the experimental boxes.

5.1009, POLLUTION OF SUBSURFACE WATER BY SANITARY LANDFILL

A.A. FUNGAROLI, Drexel Institute of Technology, School of Engineering, Philadelphia, Pennsylvania 19140

This study has as its overall objective the establishment of criteria for choosing landfill sites and the development of computer models for use in landfill design and evaluation. There are three long-range objectives:

1. To provide means for predicting the quantitative movement of contaminants to ground water from present and proposed sanitary landfills.
2. To appraise design methods and remedial procedures for reducing any undesirable contaminant movement to within specified limits.
3. To develop hydrologic criteria for evaluating site suitability for sanitary landfill.

An overall objective of this project is to meet these aims by development of mathematical design models that describe the hydrologic functioning of and the contaminant movement from a sanitary landfill in varied geological environments.

5.1010, STREAM QUALITY PRESERVATION THROUGH URBAN LAND USE

R.E. COUGHLIN, Univ. of Pennsylvania, Graduate School, Philadelphia, Pennsylvania 19104

This proposal is part of an overall plan for management of water and land resources in the Upper Brandywine River Watershed. The staff seems well qualified and the available resources are more than adequate. Information gained from this project will assist other urban areas in the formulation of water pollution control programs.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1011, ECONOMICS OF WATER QUALITY IN A REGIONAL SYSTEM

W. ISARD, Univ. of Pennsylvania, Graduate School, Philadelphia, Pennsylvania 19104

Significance: Over the past several years, RFF has made considerable progress in furthering study of the economics of water quality management. In the early stages the staff and grant studies focused heavily upon clarification of concepts and empirical estimation of particular benefits and costs associated with improving water quality. Two books have already resulted from this effort and several other major reports are in preparation. In order to show the applicability and significance of the work already done, as well as to extend it, we have begun case studies of realistic situations characterized by differences in hydrology and in character and intensity of development. Two of these are under way dealing with the lower Potomac and the Miami tributary of the Ohio. The present study would be the third of the series. It would focus upon the Delaware Estuary. The Estuary is heavily industrialized, has a large contiguous population and severe water quality problem.

Specific Aims and Expected Results: The project would use and improve existing tools for analyzing the water resources and economic development of the area. This would be done in order to assess the benefits and costs associated with alternative quality management programs. These might include such elements as regulation of river flows into the estuary, high-level treatment at certain times and locations, artificial re-aeration of the estuary, transporting wastes away from critical areas, and regulating reservoir system analysis, and forecasting of waste assimilative and transport capacities would be used in an integrated fashion. This would give new power and depth to water quality management analysis. The funds required to execute this study go beyond those which could be made available by RFF. Consequently the principal participants have worked out arrangements to obtain supplementary funds for certain of the natural service and engineering aspects of the work from the U. S. Public Health Service. It is expected that the project will result in several articles in professional journals and a publishable monograph.

SUPPORTED BY Resources For The Future Incorporated

5.1012, WATER TRANSPORT ACROSS MEMBRANES BY ELECTRO-OSMOSIS

N. LAKSHMINARAYAN, Univ. of Pennsylvania, School of Medicine, Philadelphia, Pennsylvania 19104

Transport of ions and of water taking place when the system electrolyte solution through the membrane to and from electrolyte solution is subjected to the action of an electric field (d.c) will be investigated thoroughly as a function of current density using dilute solutions and well characterized membranes, both ionic and nonionic. The total volume of transport of water for the passage of a faraday of current, phenomenologically called electro-osmosis and composed of both ionic hydration and water transported by electroconvection, has been measured by a number of workers. The dependence of this transport on current density being the subject of some controversy will be investigated thoroughly. The effect of imposing an a.c. field on the volume of transport will be studied as a function of the frequency of the imposed field. It is hoped that these studies will shed light not only on the mechanism of water transport through different membranes but also to provide information about the quantity of water associated with a moving ion.

5.1013, PARTICULATE-ORGANIC EFFECT - SENSORY QUALITY OF WATER

R.A. BAKER, Carnegie Mellon University, Graduate School, Pittsburgh, Pennsylvania 15213

Preliminary studies have shown that highly electronegative particulates of colloidal dimensions escape conventional coagulation treatment and carry over into the finished water supply. It is hypothesized that these particulates serve as condensation nuclei for organic constituents. Adsorbed microorganics are suspected to be responsible for taste and odor problems, particularly where formation of chloroorganic derivatives is possible. Laboratory studies will be conducted to test this hypothesis using selected organic-particulate-aqueous matrix systems. These waters will be coagulated under precisely-controlled conditions. The sensory, chemical and physical characteristics of the treated water and associated particulate-organic will be measured. A thorough understanding of the behavior of a known system must precede tests with natural waters in field practice. There is an immediate need for such knowledge for control of microorganic contaminant content of potable supplies and this need will increase as water reuse intensifies. These results are expected to help control groups, industrial waste control and water-treatment plant operators, and chemical and environmental health researchers.

5.1015, EFFICIENT SYSTEM OF WATER QUALITY MANAGEMENT FOR THE MIAMI BASIN

F.T. DOLBEAR, Carnegie Mellon University, Graduate School, Pittsburgh, Pennsylvania 15213

Significance: RFF has already mounted a substantial effort in water pollution research. Theory, methodology, and empirical information have been developed with respect to this problem. This research indicates that some of the most important opportunities for more effective and efficient management of water quality is in the smaller highly developed basins across the country. The proposed study will bring what has been learned to focus on such a basin--the Miami--and contribute further to methodology and factual knowledge. The Miami not only is highly developed and has serious water quality problems but also has a respected organizational arrangement for providing flood control works which might be adapted to more or less precise management of water quality. Officers of this group--the Miami Conservancy District--have shown a strong interest in the proposed study. The project simultaneously provides an opportunity to test analytical approaches developed by RFF research and to contribute to the solution of an actual serious problem. Moreover, it provides an occasion for soundly-based interdisciplinary research which should develop and demonstrate approaches of wide applicability to pollution problems elsewhere. Because of the method of procedure used, the project will also contribute significantly to education.

Specific Aims: To make a detailed systematic engineering-economic analysis of alternative methods of water quality management in the Miami Basin and to make further contributions to the theory and methodology of analysis in the critically important field of water pollution.

Method of Procedure: Under a previous reconnaissance grant from RFF (10,000), Professors Dolbear and Kamien acquainted themselves with some of the essential details of water pollution and sanitary engineering, thoroughly investigated alternative possible case study areas, arranged for obtaining necessary data from various sources, and did preliminary work on analytical methods. Professor Day has a background in several subjects bearing directly on the problem including sanitary and hydraulic engineering, and hydrology. Among other things, Professor Day currently teaches advanced hydrology and has been involved in stream-flow simulation work. This type of analysis is essential to the project.

5.1016, A CONCEPTUAL STUDY OF THE DISTRICT OF COLUMBIA BIOLOGICAL TREATMENT PILOT PLANT

C. WOOD, Swindell Dressler Company, Pittsburgh, Pennsylvania (14-12-149)

To perform a study to develop the concept of the District of Columbia Biological Treatment Pilot Plant in accordance with the requirements set forth herein: I. Study Criteria: A. Evaluate the process layout and hydraulic requirements of the two train (100,000 gpd per train) biological treatment pilot plant as described in the attached specification for installation at the District of Columbia Water Pollution Control Plant. B. Develop a sludge disposal system for the above pilot plant which includes: 1. Sludge dewatering systems. a. vacuum filtration. b. centrifugation. c. experimental dewatering. 2. sludge incineration. C. Prepare functional process layout for two larger pilot plants based on the design criteria and flexibility in above D.C. pilot plant and including disposal facilities for plant sized with: 1. Two nominal 250,000 gal per day treatment trains. 2. Two nominal 500,000 gal per day treatment trains. D. Furnish a cost estimate for the (100,000 gpd/train) pilot plant in A above.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1017, USE OF COAL AS ADSORBENT FOR TREATING WASTE WATER

J.H. FIELD, U.S. Dept. of Interior, Coal Research Center, Pittsburgh, Pennsylvania 15213

The objective is to determine the effectiveness of coal and coal-derived materials such as char and flyash as adsorbents for the organic contaminants in secondary treated domestic sewage.

The degree of removal of organic contaminants from secondary treated waste water is under study in batch tests and continuous flow systems. The batch tests serve as a screening device for choosing the better adsorbents for further testing in the continuous flow system. Because the degree of contaminant removal obtained in batch tests could not be attained in continuous-flow glass column tests, a stirred contactor will be used.

A second part of the project concerns utilization of coal in sludge digestion. Bench tests have indicated that methane can be produced from bacterial (anaerobic) action on certain types of coal. Bacteria from sewage plant anaerobic digesters are used.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

5.1018, WATER CONTROL - CONTROL TECHNIQUES FIELD TESTING AND EVALUATION

N.N. MOEBS, U.S. Dept. of Interior, Mining Research Center, Pittsburgh, Pennsylvania 15213

The immediate objective of the Water Control program is to continue collecting and analyzing water effluents and air samples; obtain geologic, hydrologic, and mine data; and develop plans cooperatively with engineers of involved coal operations to reduce the quantity and improve adequately the quality of the water discharged from active mines. Monitoring the flow and quality of effluents from, and of air in, abandoned sealed underground mines above drainage is being continued.

Cooperative agreements with four coal companies are in effect, with encouraging prospects to seal and inundate 30 to 70 percent of the area of one mine to eliminate present treatment within 1 or 2 years after the mine is worked out; and to pipe a low acidity quantity of water generated in the active area of another mine (approximately one-half of the total discharged daily from the below drainage mine) to the main pump sump rather than permit it to flow first into the highly acid water in the main pool located within an old mined out area and, thereby, reduce the cost of treatment.

Also, the sealed 80-acre underground mine above drainage has shown a progressive decrease in the average total acidity for any month after sealing, compared to the same month of any year prior to sealing, indicating reduction in seasonal effects from year to year. Recent infrared imagery has detected a number of permeable zones which may be corrected.

Beginning with fiscal year 1969, the Drainage Control and Mine Sealing projects have been combined into one component (Water Control).

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

5.1019, PLUTONIUM REMOVAL IN WATER TREATMENT

J.B. ANDELMAN, Univ. of Pittsburgh, School of Public Health, Pittsburgh, Pennsylvania 15213

The aim of this investigation is to study the effect of the various processes in current municipal water treatment practice on the removal of plutonium from a raw water supply, so as to be able to adjust these procedures for optimum removal. The major portion of the study will be concerned with studying the various treatment operations separately as to their effect on the state of plutonium and its ability to be removed in a given process or a subsequent or simultaneous one. When these are sufficiently understood, the operations will be combined into a bench scale pilot plant in order to interrelate them and attain the most efficient removal of plutonium. The oxidation state of the plutonium, the size and charge of colloidal and larger aggregates, the influence of added or natural occurring complexing agents, and coprecipitation phenomena will be of principal consideration. The operations to be studied will be chlorination, lime-soda softening,

5. WATER QUALITY MANAGEMENT AND PROTECTION

coagulation and flocculation, and sand and carbon filtration. It is expected that a thorough understanding of the role of each of these processes as related to the chemistry of plutonium will result in recommendations for reasonably and conveniently adjusting conventional water treatment processes so as to produce a water safe to drink, even in the event of gross contamination of plutonium in the raw water supply.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1020, THE MICRODISTRIBUTION OF STREAM BENTHOS

K.W. CUMMINS, Univ. of Pittsburgh, Graduate School, Pittsburgh, Pennsylvania 15213

Continued investigations into the significance of trophic relations in determining the microdistribution and abundance of stream macrobenthos will yield highly detailed information on the trophic structure of a lotic community. Calculations and analyses are accomplished by computer programming. One program permits a highly refined calculation of community trophic structure relative to species distribution patterns. A second program combines all currently available ingestion data and produces summaries, by age class, for each species at the level of samples, transects (5 samples) and combined transects. A third program calculates standing crop data (numbers, weights and calories/square meter, again by size class, for each species at the sample as well as the transect level. A fourth program will be employed to correlate age-specific species standing crop data with the nature of the stream sediments (as analyzed according to the Wentworth Scale).

Standing crop production data are also being gathered on the stream periphyton and estimates will be made of the contribution of allochthonous detrital organics to the stream.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1021, CYTOPATHOLOGICAL CHANGES IN NATIVE FISH SPECIES EXPOSED TO STREAM POLLUTANTS

A. ANTHONY, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Representative species of native fish will be collected in streams with varying degrees of pollution. Some will be killed for immediate cytochemical analysis of tissues; others will be maintained in aquaria under controlled conditions for use in recovery studies. Initially, main emphasis will be on measures of DNA profiles in both liver and gonads using the Feulgen nucleal reaction in conjunction with absorption microspectrophotometry. In addition, nuclear and cytoplasmic RNA and proteins will be analyzed using quantitative cytochemical staining and absorption microspectrophotometry.

In brief, studies will be directed toward spectral analysis of cellular elements of the liver and gonads of fish from unpolluted streams and from streams with known degrees of pollution. Subsequently, cytochemical characteristics of subcellular fractions separated by differential centrifugation will be compared with nuclear and cytoplasmic staining in situ.

On the basis of microchemical study of various organs it should be possible to predict: a. which species possess natural resistance to alterations in stream quality, b. which species are adapted to reproduce in streams with varying degrees of pollution, and c. the extent to which a stream must be improved to allow fish to grow and reproduce.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1022, DEVELOPMENT AND EVALUATION OF MEANS AND MEASURES FOR CHANNEL STABILIZATION

R.P. APMANN, Penn. State University, U.S.D.A. Ne. Watersh. Res. Ct., University Park, Pennsylvania 16802

Object: To determine the relationship between flow characteristics, scour, and sediment transportation or deposition in channels, and the effectiveness of vegetal and structural materials proposed for channel protection; to develop protective works for channel banks, and design criteria for systems of grade control structures for channel stabilization; and to evaluate the role of

reservoirs on channel stability for the range of conditions in land resource areas of the Northeast.

Plan of Work: The mechanics of sediment transport and the relation of channel flows that can be sustained without scour are measured in natural channels and the laboratory. Studies are made of variables such as depth and velocity of flow, rate of transport of bedload and suspended sediment, the soils of the channel bed, and irregularities of channel surface, cross-section, alignment, grade, size and distribution of sediment, character of the banks and channel bed, geology of the site, and of the geometry of natural streams. Hydraulic features are measured to locate points of critical erosion potential. Fluid shear stresses in natural channels are evaluated from field measurements and by model studies simulating channels of varying curvature under a range of flow conditions to establish information on erosive forces. Various means for stabilizing banks or natural channels are devised and evaluated.

SUPPORTED BY U.S. Dept. of Agriculture

5.1023, FEED AND WASTE HANDLING IN THE DAIRY OPERATION

H.D. BARTLETT, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

Objectives: 1. To evaluate and develop methods and equipment for mechanization of handling materials in dairy livestock feeding operations, particularly stall barns. 2. To evaluate and develop methods and equipment for handling and distribution of wastes from dairy production systems.

Procedure: 1. Studies will be made of existing feeding equipment installations to evaluate labor requirements and equipment costs for feeding dairy cattle in stall barns by mechanical feed carts and with various manger conveyor feeding systems. Work will be done on the development of mechanical feed conveying equipment that will be low in initial cost, dependable, durable, adaptable to handling both grain and chopped forage, and provide flexibility in relation to installation in barn arrangements. 2. Studies of dairy waste management will include handling of animal excrement and the waste water used in cleaning milk houses and milking parlors. The methods of handling to be studied will include animal excrements removal from paved areas and stall-barn gutters to a storage tank or direct application to fields. Handling the wash water directly to fields by sprinkler irrigation systems will also be studied to evaluate operational problems which may be encountered in the daily application on a year-round basis under Pennsylvania conditions.

SUPPORTED BY U.S. Dept. of Agriculture
Pennsylvania State Government

5.1024, THE BEHAVIOR OF SMALLMOUTH BASS AS RELATED TO ARTIFICIAL COVER

R.L. BUTLER, Penn. State University, State Coop. Fishery Unit, University Park, Pennsylvania 16802

Reason for study: Although cover is recognized necessary for the maintenance of many species, the characteristics of cover and the response of the organism to it have not been studied to any great extent. In some marginal streams the variability of cover may be the limiting factor for the bass population. If cover is a limiting factor, a species depended upon it may have low population levels even where food is abundant. Much money has been spent on 'stream improvement' devices without knowledge of the preferences of fish for these structures. Since response to cover is a behavioral parameter of a species, measures of it may be used for bio-assay.

Objectives: (1) To determine those components of cover that are attractive to smallmouth bass. (2) to demonstrate the effects of water velocity on the utilization of cover by smallmouth bass. (3) To test response to cover as a bio-assay for mine acid pollution.

Design of Project: An experimental stream trough will be built and placed in operation at a nearby impoundment. One fish at a time will be introduced into the stream trough and exposed to a series of cover objects designed to simulate various features of natural cover. Current velocity will be varied to determine its effect on utilization of the cover. The tests will be run in high car-

5. WATER QUALITY MANAGEMENT AND PROTECTION

bonate and low carbonate water for baseline measures under unpolluted conditions. Bio-assay of mine acid water will be done at several stream sites offering various degrees of mine acid pollution.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Pennsylvania State University

5.1025, AN ECOLOGICAL STUDY OF AN ALKALINE STREAM WITH HEAVY IRON DEPOSITS ORIGINATING FROM TREATMENT OF MINE ACID WATER

R.L. BUTLER, Penn. State University, State Coop. Fishery Unit, University Park, Pennsylvania 16802

Reason for Study: Mine acid polluted waters from the Susquehanna River are pumped into an abandoned mine. On leaving the mine and entering Beaver Run, the alkalinity is increased and a heavy precipitate of iron salts results for some three to four miles downstream. These conditions are also noted in streams artificially treated with lime to reduce acidity resulting from pollution. Understanding how the biota in Beaver Run are affected by the increased alkalinity and the iron-salts precipitate will assist in evaluating the lime treatment projects currently in operation as well as those being recommended for control of acid pollution in many Appalachian streams.

Objectives: 1. Determine the structure of the ecosystem in Beaver Run and Little Beaver Run. 2. Determine the effects of increased alkalinity and iron-salt deposits on the aquatic community in general and the native fish and brook trout egg development in particular.

Design of Project: Invertebrates will be sampled periodically at 10 stations. They will be analyzed as to species diversity and relative abundance. Physical and chemical analyses for the stations will be recorded. At several stations, population estimates of the native trout will be determined. Brook trout eggs will be 'planted' in the stream during the fall of the year and the percentage survival will be computed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Pennsylvania State University

5.1026, THE DISTRIBUTION OF FISH IN PENNSYLVANIA AS RELATED TO MINE ACID DRAINAGE

E. COOPER, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Reason for Study: The Bureau of Sport Fisheries and Wildlife in cooperation with the Pennsylvania Fish Commission has obtained from 280 stream sections in Pennsylvania samples of fish populations. When these collections were made measurements of water quality were also taken. These fish samples provide a baseline on fish populations in relatively unpolluted habitats. Collections need to be made in streams and lakes exposed to various levels of mine acid pollution. Parameters such as species composition, growth mortality, food habits and fecundity of the species collected in polluted water may reflect the stress of these environments.

Objectives: 1. Determine the species of fish and their abundance in waters exposed to different concentrations of mine acid. 2. Measure the effects of various levels of pollution on each species through growth, natural mortality, fecundity and food habits.

Design of Project: A field crew of men will obtain fish samples from local sections of Pennsylvania streams and reservoirs exposed to mine acid. Physical and chemical measurements of the water at the time and place of sampling will be made. The measurements will include calcium hardness, total hardness, total acidity, pH, conductivity, temperature, stream flow, and stream and lake morphometry. All samples obtained of fish will be preserved for laboratory studies of growth, natural mortality rates and food habits.

5.1027, EFFECTS OF ORGANIC POLLUTION ON HATCHABILITY AND SURVIVAL OF BROOK TROUT, SAL-

VELINUS FONTINALIS, AND GROWTH OF BROWN TROUT, SALMO TRUTTA

E. COOPER, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Reason for Study: Spring Creek below State College, Pennsylvania, was once known as an outstanding trout stream. Following the construction of a sewage treatment plant to service the University and State College, there was a marked decline in the trout population from State College to Fisherman's Paradise. The effluent does not have a high B.O.D., however, considerable enrichment is provided the stream through the addition of phosphates and nitrates. Aquatic plants have developed excessively below the plant. The University has been applying to land areas approximately 300,000 gallons per day of the effluent. Since this practice was started, there is some thought that the stream has improved for the benefit of trout. It would be desirable to know to what extent the stream can support trout under these present conditions.

Objectives: 1. To determine the present status of trout populations in Spring Creek through an analysis of natural reproduction, population size, growth rates, and mortality. 2. To relate the objective no. recovered) of the stream for investigation. 3. To determine the success of hatching of brook trout eggs in Vibert Boxes in the three areas and relate hatching success and survival to oxygen, water temperature, and turbidity.

Design of Project: Trout will be collected with electro-fishing gear in the three sections of Spring Creek. Springs and ground water seeps in the stream will be located in the three study areas and will be used as locations for planting brook trout eggs. Eggs placed in Vibert Boxes will be located above and below the springs and seeps. Each of these stations will be monitored for oxygen, temperature, and turbidity.

5.1028, ABUNDANCE AND DISTRIBUTION OF BENTHIC MACRO-INVERTEBRATES IN A STREAM RECEIVING OIL-FIELD WASTEWATERS

E. COOPER, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Reason for Study: Inorganic salts, such as those present in oilfield brines, are common pollutants from oil production facilities and other industrial operations. A more thorough knowledge of the specific effects that these substances may have upon aquatic systems should lead to a more intelligent management of our water resources.

Objectives: 1. To correlate the abundance and distribution of several benthic macro-invertebrates with the environmental levels of dissolved solids (salts). 2. To determine the actual tolerance levels of certain of these organisms to brines of known composition under laboratory conditions.

Design of Project: Bio-assay procedures will be performed in the laboratory to determine specific tolerance limits of specific organisms towards the wastes under investigation. A program of chemical and biological sampling will be conducted in the field over a period of one year to appraise the effects of the wastes upon a natural aquatic invertebrate community.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Pennsylvania State University

5.1029, CHANGES IN STREAM COMMUNITIES ASSOCIATED WITH EFFLUENT - INDUCED EUTROPHICATION

E.L. COOPER, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Reason for Study: Secondary sewage treatment plants that remove nearly all BOD but leave much of the inorganic nutrients in the effluent are being used in an increasing number of municipalities to arrest organic pollution. Stream enrichment, however, alters predator-prey trophic systems culminating with fish. In naturally fertile streams further fertilization can result in high plant standing crops and decreased fish standing crops. The biological changes in intermediate trophic transfers between the plants and fish probably play a significant role in decreased fish

5. WATER QUALITY MANAGEMENT AND PROTECTION

standing crops. Evaluation of community alterations by eutrophication are necessary for satisfactory stream management.

Objectives: 1. To determine changes in species diversity and abundance of macro-invertebrates associated with eutrophication. 2. To determine changes in production of aquatic plants and macro invertebrates associated with stream eutrophication.

Design of Project: Samples have been collected from two areas in Spring Creek which are similar except for the presence of treated sewage effluent in the lower area. Gross primary production is being estimated by measuring 24-hour changes in dissolved oxygen. Fish exclosures were placed in riffles and the silted edges of pools and sampled monthly to determine macro-invertebrate production. Seasonal samples have also been taken from four similar riffles to compare community structural properties above and below the source of effluent.

5.1030, SUBSURFACE WATER POLLUTION FROM SANITARY LANDFILLS IN CARBONATE ROCK TERRAIN G.H. EMRICH, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Ground water pollution from land disposal of wastes in carbonate rock terrain is a widely occurring problem throughout the humid United States. Critical information is still lacking of the physical parameters to be evaluated at land disposal sites.

Sample collecting equipment has been installed at a sanitary landfill located in central Pennsylvania. The site has at least 50 feet of sandy loam soil derived from the underlying Gatesburg dolomite. Ground water occurs at a depth of approximately 200 feet.

Liner was placed in the bottom of the sanitary landfill trench. The liner collects and directs all the leachate from the landfill to one side of the trench, where it is evenly spread through the soil. Seventeen suction lysimeters have been placed in the soil at depths up to 34 feet to monitor and collect samples of the leachate. The landfill and monitoring equipment were emplaced in November of 1967. Water was spread on the top of the landfill in order to quickly generate leachate. First leachate production occurred in January 1968 and has moved down to a depth of 12 feet. Chemical analyses of the leachate indicate high concentrations of iron, chloride, sulfate and B.O.D.

5.1031, ANALYTICAL METHODS FOR PESTICIDES AND PESTICIDE DEGRADATION PRODUCTS C.D. ERCEGOVICH, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

Development of improved analytical methods for residues of pesticides and their degradation products.

Existing methods for the determination of pesticide residues and degradation products will be critically examined for sensitivity, accuracy, reproducibility and simplicity. Attempts will be made to improve those which appear to be lacking in one or more of these qualities. Special emphasis will be placed on pesticides in common use, and on pesticide degradation products which may result from metabolic and other decomposition processes which take place in living organisms, soil, water, and other media.

SUPPORTED BY U.S. Dept. of Agriculture
Pennsylvania State Government

5.1032, FATE AND PERSISTENCE OF PESTICIDES AND PHYSIOLOGICALLY ACTIVE DEGRADATION PRODUCTS C.D. ERCEGOVICH, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

1. Follow the disappearance of pesticide residues in media other than raw agricultural commodities. 2. Qualitatively and quantitatively identify the degradation products resulting from the breakdown of pesticide residues in media other than raw agricultural commodities.

Procedure Objective 1. Measure quantitatively the amounts of pesticide residues remaining at known time intervals following application in various types of soils, still and flowing water supplies, processing plant by-products, silage, processed dairy products, feedstuffs and other processed agricultural products. This will be done by gas chromatographic methods, using various types of detectors.

Procedure Objective 2. Identify and measure any pesticide degradation products which may result from hydrolysis or decomposition caused by heat or processing or other physical or chemical forces. These will be separated by thin layer, column or gas chromatographic means and identified by infrared or other spectral analyses and the use of labelled compounds.

5.1033, THE SPECIES DIVERSITY OF AQUATIC INSECTS AS RELATED TO MINE ACID POLLUTION D.C. HALES, Penn. State University, State Coop. Fishery Unit, University Park, Pennsylvania 16802

Reason for Study: While it is generally understood that aquatic insects are affected by lower concentrations of pollutants than are fish, little is known about the sensitivity of aquatic insects to mine acid pollution. If species of fish are markedly restricted at pH 5 to 6 as evidence indicates, one may expect fish food organisms to be markedly reduced. The absence of critical species of stream insects may in fact be a limiting factor in the abundance of fish species.

Objectives: Determine the biotic index (an index based upon the abundance of species on a sliding scale of types assigned to polluted and unpolluted and clean water areas) of aquatic insects from selected waters representative of clean soft and hard water conditions and streams with varying levels of pH.

Design of Project: Field crews will sample selected streams representative of clean soft water and clean hard water conditions, a stream with pH less than 5.0, and four to six streams with pH ranging from 5.0 to 6.0. Seasonal variations in species will be determined. Relative species diversity will be determined by analysis in terms of log normal curves.

Pennsylvania State University

5.1034, SENSITIVITY OF SELECTED INSECT SPECIES TO DEPRESSED LEVELS OF PH D.C. HALES, Penn. State University, State Coop. Fishery Unit, University Park, Pennsylvania 16802

Reason for Study: One of the principal environmental changes resulting from mine acid pollution is a decrease in pH. In streams that are highly polluted with mine acids, there is a notable lack of insect fauna. Yet there is little information available concerning the sensitivity of insect fauna to depressed pH levels. The absence of critical species of insects in mine acid polluted streams may be a limiting factor to fish.

Objectives: Determine the levels of pH to which selected species of the order Ephemeroptera, Plecoptera and Trichoptera are sensitive.

Design of Project: Continuous flow bioassay techniques will be used to determine the 96-hour TL_m of the selected organisms. Water of similar quality to that most severely affected by mine acids (low alkalinity and dissolved solids) will be used. Metering pumps will provide continuous flow. Sulfuric acid, the primary component of mine acids, will be injected into the system to obtain the desired test levels of pH.

5.1035, CONSERVATION AND RENOVATION OF WASTE WATER L.T. KARDOS, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

To determine the effect of irrigation with sewage plant effluent on the yield and other plant response parameters of

5. WATER QUALITY MANAGEMENT AND PROTECTION

agronomic and forest vegetation. 2. To determine to what extent agronomic crops, trees, and the soil mantle can renovate sewage plant effluent and permits its recharge to the ground water. 3. To determine the effects of the application of sewage plant effluent on the physical, chemical and biological properties of the soil. 4. To compare the effectiveness of various surface and sprinkler distribution methods for the disposal and renovation of sewage plant effluent.

Agronomic and forested areas will be irrigated with chlorinated sewage plant effluent at weekly intervals with sufficient quantities to secure recharge to ground water but at rates of penetration which will permit renovation of the effluent in the biologically active portion of the soil mantle prior to its recharge to the ground water. Effects of the effluent on crop and tree growth and on soil properties will be determined. Engineering studies will compare several methods of applying the effluent to determine their effectiveness as distributing systems on a year round basis.

5.1036, CRUSHED LIMESTONE BARRIERS FOR NEUTRALIZATION OF ACID STREAM

R.R. KOUNTZ, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

Many small streams and creeks are lost to recreational use because of the acid quality of their water. Neutralization of this acid content would permit these streams to be enjoyed.

Work performed by numerous investigators during the previous 15 years indicates that such neutralization is possible providing the limestone is low or non-existent in its magnesium content. Unfortunately these studies were never carried to the point of such parameters as flow rate vs. stone size vs. acid concentration.

It is proposed to secure, samples of 'pure' calcium limestone from one of the area quarries in the different commercial sizes available that would be suitable for a creek barrier. These samples would be subjected to various flow rates of various concentrations of acid in the laboratory so as to evaluate the amount of acid neutralized as a function of stone size, fluid velocity, and acid concentration.

It is expected that these data would permit the design of barriers in an acid creek or stream that would neutralize the acid in the water, and restore the recreational value of the water resource.

5.1037, SOLUBLE PHOSPHORUS REMOVAL IN THE ACTIVATED SLUDGE PROCESS

R.R. KOUNTZ, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

This project will develop a process for the removal of phosphorus from municipal waste waters utilizing chemical precipitation of the phosphorus within the aeration and settling units normally used in the activated sludge process. The work will be conducted at the waste water treatment plant owned and operated by The Pennsylvania State University. Studies will be conducted to determine the relative merits of sodium aluminate and filter alum as precipitating agents, the efficiency of the coagulant in removing phosphorus over a one year operating period, the effect of the sludge digester on the inorganic precipitate. Costs and operating information for a 2.1 mgd domestic waste plant will also be ascertained.

SUPPORTED BY Soap & Detergent Association

5.1038, TREATMENT OF COAL MINE WATERS TO MEET CURRENT COMMONWEALTH WATER DISCHARGE REQUIREMENTS

H.L. LOVELL, Penn. State University, Graduate School, University Park, Pennsylvania 16802

The detailed engineering design and plans are complete. Construction for phase 1, excavation and construction of lagoons

at the site near Hollywood, Clearfield County, Pennsylvania is essentially completed.

Phases 2,3,4, and 5 (the installation of unit operations and instrumentation) has been bid and work will proceed shortly. Completion of construction is anticipated by spring 1969.

The plant will encompass a highly instrumented series of unit operations so designed that it will be capable of functioning through at least six different flow sheets. Emphasis is being placed on solid-fluid separations which comprise the highest cost operations, both capital and operating, and which offer the most difficult technical and engineering problems.

SUPPORTED BY Pennsylvania State Government

5.1039, SUITABILITY FOR SEPTIC TANK DISPOSAL SYSTEMS AND PRODUCTIVITY POTENTIALS OF PENNSYLVANIA SOILS

R.P. MATELSKI, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

To determine and predict the soil factors responsible for adequate septic tank usage. To identify the soil properties responsible for observed variations in productivities.

DESCRIPTION OF WORK PROPOSED: Field measurements and later laboratory soil determinations of the effect of seasonal variation, perched water tables and the variability within a mapping unit on waste water movements will be studied to predict efficiencies of septic tank tile disposal fields. The field percolation tests will be studied and improved. Yields of important crops on soils with variations in slope, erosion, fertilizer treatments and management will be measured and evaluated. Soils will be characterized in the laboratory to determine the soil factors contributing to yield variation.

5.1040, THE EFFECTS OF NUTRIENTS ADDITIONS AND STREAM DYNAMICS ON STREAM EUTROPHICATION

A.J. MCDONNELL, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

The purpose of this research is to measure under different environments of nutrient influx and hydraulic regime, the combined effects of induced nutrients and stream dynamics on stream productivity.

Productivity in selected stream reaches will be measured by plankton and aquatic weed growth and by photosynthetic activity as determined by net oxygen production.

Measurements of a number of nutritive stimulants including soluble phosphorous organic and inorganic nitrogen and the stream reach hydraulic characteristics of flow, velocity and turbulence will define the causal agents. Where feasible multiple correlation techniques will be utilized to establish the relative significance of each of the selected variables in promoting stream productivity.

5.1041, RESPIRATION OF AQUATIC MACROPHYTES IN EUTROPHIC SYSTEMS

A.J. MCDONNELL, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

The growth of algae and rooted aquatics in natural waters is becoming a water resource problem of increasing importance. Information is lacking as to the mechanisms by which these plants affect the oxygen resources of a water body. The purpose of the proposed study is to delineate the environmental factors which affect the respiration rates of selected aquatic plants.

Laboratory studies will include: 1. A determination of plant respiration rates under various levels of oxygen concentration, temperature and plant maturity. 2. Manometric studies to determine respiration response of clean stream plants to exogenous nutrient additions.

5.1042, HIGH-RATE, MULTIPLE MEDIUM FILTRATION FOR SECONDARY TREATMENT OF MUNICIPAL WASTE WATER

J.B. NESBITT, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

This project will study the treatment capability and economic feasibility of a high-rate, multiple medium filter for the secondary treatment of municipal waste water. The study will be conducted on a model filter constructed at the Pennsylvania State University sewage treatment plant. Effluent from the primary settling basins in the plant will be chemically coagulated and passed through the model filter.

The following analyses will be made of the influent to and effluent from the filter: (1) biochemical oxygen demand (BOD), (2) chemical oxygen demand (COD), (3) soluble and total phosphorus, (4) ammonia and nitrate nitrogen, and (5) turbidity.

Studies will be made to determine: 1. the effect of size of the top medium and different coagulants on effluent quality as measured above and on the length of filter run. 2. the washing rate and time of wash that will produce the most economical operation. 3. the feasibility of vacuum filtration for the disposal of filter wash water. 4. the economics of a waste water disposal system utilizing primary treatment; high-rate, multiple medium filtrations; and separate sludge digestion with vacuum filtration of digested sludge.

SUPPORTED BY Pennsylvania State University

5.1043, PULVERIZED ANTHRACITE COAL AS A MEDIUM FOR PRECOAT FILTERS

J.B. NESBITT, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

A small commercial vacuum type precoat filter is being used to determine the feasibility of using pulverized anthracite coal rather than diatomaceous earth as a filtration medium for the filter. Studies will be made to determine the effect of precoat and body feed doses on the removal of several different types of suspended matter. Effluent water quality, length of filter runs, and terminal head loss are being investigated. Runs will be made with several size gradations of coal and the results compared with those obtained using diatomaceous earth.

5.1044, FACTORS AFFECTING MINE DRAINAGE AND THE GROUND WATER INTERACTIONS IN SELECTED AREAS OF WESTERN PENNSYLVANIA (PART 2)

R.R. PARIZEK, Penn. State University, Graduate School, University Park, Pennsylvania 16802

As shown by a previous study, a stratification of ground water flow in the strip-mined bituminous coal field of Pennsylvania may exist that may effectively divert acid mine drainage pollution from deep ground water reservoirs. Further, opportunities for neutralization were shown to exist. These considerations may lead to the establishment of a potable ground water supply in an area afflicted with surface acid mine drainage. To test these hypothesis a specialized water monitoring system will be installed to accurately evaluate the aquifer characteristics, to determine the aquitards in the area and to sample the ground water for chemical analyses to determine the extent and effect of acid mine drainage pollution.

A related study will investigate the field conditions under which pyrite remains stable and does not decompose to produce acid mine drainage. Samples of iron disulfide from an area containing strip mines yielding alkaline drainages will be analyzed to determine the reason for the stability; hence gain an insight to acid mine drainage abatement.

SUPPORTED BY Pennsylvania State Government

5.1045, EFFECTS OF IRRIGATION OF MUNICIPAL SEWAGE EFFLUENT ON SPOILS BANKS

W.E. SOPPER, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

The purpose of the proposed project is to investigate the feasibility of ameliorating adverse strip mine spoil bank sites through irrigation with municipal sewage effluent. Benefits derived from such a method, if feasible, would be twofold (1) alleviation of stream pollution as a result of diversion of the effluent load from streams to land areas and (2) restoration of these disturbed land areas to useful productivity.

The specific objectives are: (1) to determine the degree of chemical renovation of municipal sewage effluent and sludge by spoils bank material, (2) to determine the extent of site amelioration as a result of irrigation of sewage effluent and mixtures of effluent and digested sludge on spoils banks material and (3) to determine the effectiveness of various proportions of sewage effluent and sludge and various amounts of the mixture on the revegetation of the spoils material.

5.1046, MICROBIOLOGICAL CHARACTERIZATION OF ACTIVATED SLUDGE IN A WASTEWATER TREATMENT PLANT CHEMICALLY MODIFIED FOR PHOSPHORUS REMOVAL

R.F. UNZ, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

Full scale combined chemical-biological wastewater treatment for simultaneous removal of organic matters and phosphorous is in the pioneer stage. There is little evidence to show that the biological solids are not qualitatively and/or quantitatively altered in microbial composition as a result of chemical treatment. There is no information on the bacteriological quality of the effluent from the combined treatment systems.

The objectives of this study are: 1. To obtain basic information on the microbial composition of activated sludges before and following chemical treatment of wastewaters for phosphorous removal. 2. Assuming variations in wastewater treatment efficiency result during chemical treatment, it is the intent to determine if the changes in treatment efficiency parallel changes in microbial composition of the activated sludge. 3. To consider reasons for microbial diversity in activated sludges if such seems to be related to chemical treatment of the wastewaters. 4. To supplement the data to be collected by personnel connected with the engineering aspects of a phosphorous removal project being conducted at this University's wastewater treatment plant and to contribute toward the final evaluation of that project as well as general design and operation of combined chemical-biological wastewater treatment schemes.

5.1047, GUAVA VARIETIES. SELECTION & PROPAGATION OF GUAVA VARIETIES & INVESTIG. OF COMMERCIAL & INDUST. POSSIBILITIES OF THE FRUIT (ABBREVIATED)

W. PENNACK, Univ. of Puerto Rico, Agricultural Experiment Sta., Mayaguez, Puerto Rico

To determine the adaptability of selected guava varieties for production in the different regions of Puerto Rico.

Description of Work: Data will be assembled on selected guava clones. The selection to be based on desirable processing, table and orchard characteristics like fruit yield, size, soluble solids, acidity, and vitamin C content. The best selections will be asexually propagated for further observations and propagation.

Field experiments will be performed in different regions to study the performance of selected varieties as to yield and fruit quality.

Flowering period, fruit yield and fruit size as affected by irrigation at different intervals will be studied. Usefulness of fungicides for the control of Glomerella disease will be determined. Propagation by cuttings using different rooting media will be studied.

5.1051, INTERACTION OF ANIMAL VIRUSES WITH CLAY MINERALS

P.W. CHANG, Univ. of Rhode Island, School of Agriculture, Kingston, Rhode Island 02881

The objectives of this proposal are: (1) To compare the capacity of various types of natural minerals and clays to adsorb animal viruses under the effect of different pH levels and ionic strengths; (2) To determine the fate of viruses after their adsorption on minerals and clays.

This study should provide information regarding removal of animal viruses by natural clay minerals. Such findings should be applicable in water treatment plants to improve methods for more complete removal of viral pollutants. This study will also attempt to ascertain fate of viruses after their adsorption to clay. This will be investigated in three ways: (1) Dissociation of clay-virus complexes; (2) Assaying for infectious centers of clay-virus complexes; (3) Direct observation for viral antigen on clay by means of fluorescent antibody technique. Such basic knowledge will contribute greatly toward a better understanding and control of viral pollutants.

5.1052, MULTIPLICATION OF ENTERIC VIRUSES IN SHELLFISH

P.W. CHANG, Univ. of Rhode Island, School of Agriculture, Kingston, Rhode Island 02881

Shellfish have been incriminated repeatedly as reservoirs for virus pathogens. This is evidenced by numerous occurrences of infectious hepatitis outbreaks following ingestion of contaminated oysters and hard clams and also by isolation of enteric viruses in oysters obtained from estuarine environments polluted by raw sewage.

The proposed project attempts to answer whether multiplication of human enteric viruses occurs in shellfish. The methods outlined in this study are designed to circumvent the difficulties encountered by previous investigators in evaluating whether virus measured in shellfish tissue represents persisting input virus or virus formed de novo. These methods include the use of proflavine labelled virus, electron microscopy of infected tissue. The shellfish tissues will also be examined for viral receptors.

5.1056, CHEMICAL RESPONSES BY MARINE ORGANISMS TO STRESS

H.P. JEFFRIES, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The ocean is physically stable compared with land and freshwater environments, and the medium has intimate association with the life it bathes. Consequently marine organisms have developed less complex regulatory systems than their terrestrial and aquatic counterparts. But when the ocean does change -- by natural processes or as the result of pollution -- it follows that the biotic community will also change, along with the ecosystem's ability to process waste materials. Homeostatic control at the community level is, therefore, an essential element in understanding the sea's populations, especially in coastal waters where environmental oscillations are large.

The major goal of this investigation is to identify and measure quantitatively the ways marine communities respond to ecological stress. The internal responses are measured in terms of homeostasis; the external stresses result from temperature, salinity, competition, food and pollution.

The first phase of this investigation showed that the balances of free amino acids, fatty acids and blood constituents are sensitive indicators of environmental conditions. Relationships observed in nature between external stress and internal composition are now being analyzed in the laboratory. In addition, the genetic determinants of chemical specificity will be separated from environmental influences in copepods, mollusks and fishes.

When we know the minimum stress intensities and corresponding maximum internal tolerances within which normal community composition and function are maintained, we should be able to predict the fate of populations living under various conditions of water quality.

5.1057, THE INSECT ORDER PLECOPTERA AS A BIOLOGICAL INDEX OF FRESH WATER QUALITY IN RHODE ISLAND

T.W. KERR, Univ. of Rhode Island, School of Agriculture, Kingston, Rhode Island 02881

1. The insect order Plecoptera is an important element in the game fish food chain, in mosquito control, and its population density appears to be associated with the decomposition of certain types of organic matter. 2. A selected natural drainage system in Rhode Island will be studied for the purpose of determining the effect of industrial and sewage wastes, metal solutes, pH, water temperature, etc. on the population development of Plecoptera. 3. Eight sampling sites would be mapped in a stream where types of pollutants could be defined in four sites before and four sites after their discharge. 4. Sampling would be accomplished to quantify the various species of Plecoptera found. Concurrently, determination of the temperature, oxygen content, organic matter, free ions, pH, etc. of the water at each site would be taken. The 'quality' of the water would then be correlated with the number and species of Plecoptera present.

5.1059, SENSITIVITY OF BENTHIC MICROFLORA TO POLLUTION GRADIENTS

N. MARSHALL, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

Recent investigations show that the major share of the high productivity of shoal estuarine environments is due to the photosynthesis of the benthic microflora. This community, composed of one-celled forms, is probably quite vulnerable to pollution. We have developed a technique for assaying the productivity of this benthic community from the C-14 uptake, using small undisturbed samples. This program, based on such assays, has the following objectives:

(1) Continue to refine and verify the C-14 technique for assaying the productivity of the benthic microflora of undisturbed sediments.

(2) Establish with this technique the norms for three coastal areas that are free of pollution. These observations of norms are being conducted over a three-year period to establish satisfactory base lines. One site to be studied is adjacent to the Millstone Point Nuclear Power Plant and later will be affected by 10 degree F temp. increase and low-level radioactive input when the plant goes active (scheduled for 1969). The other two sites are nearby estuarine areas of Point Judith Pond and the Pettaquamscutt River.

(3) Investigate for a three-year period the effect of thermal change and domestic pollution on the productivity of the benthic microflora. This involves the Millstone site for thermal effects and the polluted Mystic River for effects of domestic pollution. The major microflora present and key ecological parameters are being determined for the observation sites.

5.1060, THE GAUZE PAD METHOD FOR THE ISOLATION OF VIRUSES FROM INLAND AND ESTUARINE WATERS

L.T. MILLER, Univ. of Rhode Island, School of Agriculture, Kingston, Rhode Island 02881

The bacterial flora of coastal and inland waters have been studied repeatedly, but information is very fragmentary concerning water pollution with human enteric viruses.

Phase 1. Evaluation and Development of Methodology. Under controlled laboratory conditions, water will be artificially polluted with known levels of enteric and other viruses. Experiments will be done to evaluate the adsorption capacity of various types of gauze pad as well as threads of synthetic fibers. Attempts will also be made to compare the elutability of virus from gauze pads of cotton and synthetic fibers in different buffers, namely phosphate, borate, tris, and others. Virus in these eluates will be concentrated by using the salts indicated above. A standard gauze pad technique will be developed for viral isolation in water and this will be used for the phase 2 study.

Phase 2. Field Investigation of Water Pollution. Samples will be collected periodically from selected areas in Rhode Island by using an appropriate standardized gauze pad technique developed in Phase 1. Attempts will be made to isolate their viral flora by inoculating the concentrates into a spectrum of cell cultures, suckling mice and avian embryos. Concomitantly, the waters for viral sampling will be tested for coliform MPN, E. Coli, and fecal

5. WATER QUALITY MANAGEMENT AND PROTECTION

streptococcal contents. The viral isolation results will be correlated with those of the bacterial indicator tests.

5.1063, COLLECTION AND ESTABLISHMENT IN CULTURE OF SPECIES AND STRAINS OF MARINE PHYTOPLANKTON ORGANISMS T. SMAYDA, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The University of Rhode Island Graduate School of Oceanography shall supply a large number of species and strains of marine phytoplankton which should be at the disposal of the National Marine Water Quality Laboratory, at all times, so that various environmental, physiological, and toxicological tests can be accomplished. Cultures of the various species and strains shall also be made available to other FWPCA laboratories involved in pollution control activities for use in bioassays and other tests developed by NMWQL for the detection and evaluation of pollutants. The diversity of environmental requirements of phytoplankton necessitates the establishment of individual species and strains in culture.

Further, the contractor shall develop the mechanics of a system for obtaining these organisms so that the culture collection will become complete for the purpose at hand; shall develop an orderly arrangement for accession to the collection. The contractor shall also, scientifically identify each species and/or strain of phytoplankton by established procedures; utilize as the basis for the proposed collection, organisms already being maintained by the University Laboratory, NMWQL, and those available from academic institutions and research organizations. He must further provide the NMWQL with required data, and advise the NMWQL of the progress and status of the cultures and program as requested.

5.1064, BUOYANCY AND SINKING CHARACTERISTICS OF FRESHWATER PHYTOPLANKTON T.J. SMAYDA, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The proposed research plans laboratory investigations of the sinking behavior of representative freshwater diatom and blue-

green species occurring in the phytoplankton. It is directed towards understanding, predicting and controlling primary production, species periodicity and succession, algal blooms, and relevant lacustrine biogeochemical problems insofar as they are influenced by the sinking behavior of these plants. Following the establishment of the species into unialgal culture, the specific objectives employing several techniques are: 1. To determine the influence of cell size, cell age, cell shape, and colony size and mode of formation on limnetic phytoplankton sinking rates. 2. To determine the influence of plant nutrients and inorganic and organic herbicides and inhibitors on sinking rates. 3. To determine the role of turbulence in the suspension of limnetic phytoplankters.

5.1065, FLOCCULATION OF COLLOIDS WITH POLYELECTROLYTES IN AQUEOUS SALT SOLUTIONS D.L. SUSSMAN, Univ. of Rhode Island, School of Engineering, Kingston, Rhode Island 02881

The aim of this project is to study the adsorption characteristics of polyelectrolytes in relation to the flocculation of colloidal and suspended matter in aqueous salt solutions, and to determine the factors that influence the adsorption equilibrium. The effects of the medium upon the polyelectrolytes will also have to be studied.

The study of the behavior of polyelectrolytes as flocculants in aqueous salt solutions would lead to the maximum effective utilization of the coagulation process in saline waters.

5.1066, WATER QUALITY PROTECTION - SYNTHESIS OF POTENTIAL MOLLUSCICIDES J.G. TURCOTTE, Univ. of Rhode Island, School of Pharmacy, Kingston, Rhode Island 02881

A number of hydroxy-L-proline derivatives having elements of structural similarity to the potent molluscicide, N-tritylmorpholine, will be synthesized and tested for potential molluscicidal activity against *Australorbis glabratus*, and intermediate host (pathogenic fresh water pollutant) of *Schistosoma mansoni*. The design of the derivatives features attempts to effect definite gradations in the water solubility and stability of the potential molluscicides. An attempt will be made, using stereochemical correlations, to determine whether or not the morpholine moiety of N-tritylmorpholine contributes significantly to the molluscicide-bioreceptor interaction in the snail (*Australorbis glabratus*).

5.1067, MODEL FOR DETERMINING THE MOST UNFAVORABLE CONDITIONS FOR AREA CLASSIFICATION V.J. CABELLI, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Marine Vir. Res. Ctr., Narragansett, Rhode Island

Variable hydrographic, meteorological, and sanitary conditions modify the level of sanitary pollution reaching a shellfish growing area. To provide the required safety, the National Shellfish Sanitation Program requires that growing area classification be performed 'under the most unfavorable conditions (MUC)' that is, when conditions are most favorable for maximum pollution. Logistic factors associated with sampling and assay often limit the capabilities of States to determine the MUC. This project is intended to provide States with a 'modus operandi' consisting of, 1) a prediction based upon available information, 2) confirmation and, as required, modification of the prediction by a screening procedure using the ETCP method, and 3) actual sampling for classification using standard methods. Using Narragansett Bay, Rhode Island as a model area, the impact of day of week, time of day, and rainfall has been examined as a preliminary to this study. Rainfall, with its effect on runoff and sewage bypassing was found to be the major factor which must be considered. This project started in FY 1968; completion anticipated by FY 1969.

5.1068, THE DEVELOPMENT OF OPERATIONAL SHELLFISH DEPURATION AND RELAYING SYSTEMS
V.J. CABELLI, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

The feasibility of utilizing the normal feeding-cleansing mechanisms of molluscan shellfish for the removal of microbial pollutants (Depuration) is well established. However, in order to realize the full potential of the process in economically making a safe product available from that portion of the resource lost to pollution and as a second barrier to disease, the means must be found to 1) reduce the treatment period, 2) decrease the variability in animal response, 3) increase the upper limit of contamination in the animal which can be removed consistently, and 4) develop the economically more advantageous recirculating as opposed to flow-through systems.

Certain factors affecting contamination levels and depuration are being studied: 1) the initial level, 2) natural vs. artificial levels, 3) 'thermal shock,' which limits depuration of coliforms from quahaugs, and 4) chemical and physical stimuli for depuration. Completion is anticipated on the: 1) examination of uptake and elimination of *Salmonella typhimurium* by the quahaug, 2) model system for comparing indicator to pathogen uptake and elimination, and 3) development of operational recirculating depuration systems for the quahaug and softshell clam. The development and evaluation of 'two-stage' rafting- depuration system is underway from the depuration of grossly polluted quahaugs. Chemical studies continue on the mechanism and site of trace metal retention by shellfish towards development of: 1) relaying schedules for chemically-contaminated shellfish, and 2) operational depuration.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1069, STUDY OF GROWING AREA STANDARD BY EXAMINING ENTEROPATHOGENS AND INDICATOR
V.J. CABELLI, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

The microbiological standard for shellfish growing waters (median coliform MPN is less than 70/100ml) assumes that the probability of enteric infection from the consumption of shellfish taken from the area is negligible. Validity of correlation of the coliform indicator with outbreaks and sporadic cases of infectious hepatitis associated with the consumption of shellfish is being examined by determining the relationship of indicator levels to enteropathogenic viruses and bacteria in selected shellfish growing areas through 1) correlation of frequency of isolation of enteric viruses and *Salmonella* sp. to coliform, fecal coliform and ET coliform levels; 2) longitudinal survey of estuaries and shellfish for presence of human enteric viruses; 3) comparative survival of coliforms, *Salmonella* species, and viruses in seawater; and 4) sanitary significance of members of the coliform group. Various enteric viruses were isolated from two species of shellfish and the overlying waters in a preliminary study conducted in the Pawcatuck River, Rhode Island. A rapid plating method for enumerating coliform capable of growth at an elevated temperature (ET coliform) has been developed and evaluated at three locations.

5.1070, THE ECOLOGY OF CLOSTRIDIUM BOTULINUM TYPE E
V.J. CABELLI, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

This project, whose major objective is a better understanding of the ecology of *C. botulinum* type E in the estuarine environment, includes studies on the biological control of toxin production by the organisms and genetic, serologic and physiologic studies on the organisms, particularly as they are significant to the taxonomic and ecologic relationship of *C. botulinum* to the so-called E-like organisms. This project was started in FY 1964 and it is anticipated it will be completed by June 1970.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1071, STUDY ON METHODOLOGY FOR VIRAL EXAMINATION OF SEAWATER AND SHELLFISH
O.C. LIU, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

Although epidemiologic evidence indicates that the marine environment is polluted with human viral pathogens, no satisfactory methods are available to isolate the various types of enteroviruses in the marine waters and their fauna, especially shellfish which are consumed raw. At least eight procedures, described recently for isolation of low levels of virus from fresh waters, can be applied to examination of marine waters. These methods will be evaluated for their efficacy in recovery and enumeration of the virus in seawaters. Then the most simple and effective method will be standardized for widespread use to achieve this purpose. There is a paucity of information on methodology for viral examination of shellfish, except that described by Metcalf and Stiles (1965) and that used in this Laboratory. Four new approaches will be tried for examining very low viral contents in these animals; the best procedure will be standardized. Project started in FY 1969 and it is anticipated will be completed in FY 1972.

5.1072, MARINE BIOTOXINS
B.H. PRINGLE, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

Neither the number of known marine biotoxins nor the incidence of associated disease is great; however, with increased use of the marine environment as a source of food and recreation, the importance and number of these toxins as a health problem will increase. Study of Paralytic Shellfish Poison, a compound of both economic and scientific interest, is hampered by lack of a convenient and accurate method of analysis. Since shellfish apparently are not affected by PSP, although it is concentrated within them several thousandfold over maximum levels of the poison-producing organisms in the marine environment, we plan to introduce the poison directly into their circulatory systems to determine its overall effect. The relationship between effects of natural blooms of the dinoflagellates *Gonyaulax catenella* and *G. tamarensis* and the toxin (PSP) on the microflora of the water mass are unknown; it would be useful to know whether or not PSP has antimicrobial activity. Indeed, if the effect of PSP on a variety of microorganisms could be determined and its spectrum elucidated, it would be a significant contribution towards future ecological studies and it might provide an alternative assay method for PSP.

It is planned to attempt development of a suitable method for the quantification of PSP making use of chromatographic techniques. In addition, an investigation of the mechanics of uptake and the site of deposition of PSP in the mollusk will be made. Finally, a study of its biological effects other than its toxic properties will be initiated.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1073, RELATIONSHIP OF THE SOURCE TO LEVELS OF TOXIC CHEMICALS IN SHELLFISH
B.H. PRINGLE, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , Narragansett, Rhode Island

Since 1964, we have been collecting and analyzing shellfish from the Atlantic Coast between Maine and North Carolina. The analyses, except for special studies, have been confined to detecting heavy metals in commercial bivalve species; these shellfish selectively concentrate in their tissues chemicals from their environment. Much variation was discovered in the amounts and types of metals found in shellfish from different areas, however, little documented information was available for comparison with these differences. To bridge this gap, literature relevant to toxic chemical wastes produced along the coast will be reviewed, followed by contact with state agencies to obtain more detailed information. Such data, on the industrial complexes and their toxic chemical wastes, should provide an overview of the prevailing conditions to which shellfish are subjected and round-out information required for further development and review of toxic chemical standards for shellfish.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.1074, TOXIC AND OTHER CHEMICALS IN MARINE BIOTA

B.H. PRINGLE, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , *Narragansett, Rhode Island*

The mechanics of concentration of toxic and other chemical materials are under investigation and may be categorized as follows:

- I. Uptake and concentration within the natural environment.
- II Determination of the uptake rates and concentration within a simulated natural environment.
- III Investigation of anatomical areas of storage.
- IV. Depletion rates in a simulated natural system.

Under the above categories our efforts are directed toward studies involving the uptake rates and concentration levels for selected trace metals under various conditions of salinity, temperature, and dissolved oxygen, which we might expect to be found under natural environmental conditions. Commensurate studies are being carried out within a simulated 'natural' environment using various concentrations of selected trace-metals. Anatomical areas of storage of trace-metals are being investigated for certain mollusks using a simulated 'natural' environmental system. In addition, depletion rates for certain of these materials are being determined in an environment free from pollution by these materials.

In addition to the above studies in the subject area the following related projects are presently under investigation. Instrumental methods for the quantitation of 'Dibrom,' 'Diquat' and 'Paraquat' are being developed or adapted for use with shellfish samples. Assay methods of fluorides in shellfish are being investigated. Methodology for the isolation and quantitation of Paralytic Shellfish Poison is being investigated.

5.1075, GENERAL TECHNICAL ASSISTANCE

C.N. SHUSTER, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , *Narragansett, Rhode Island*

To support the goals of the National Shellfish Sanitation Program as updated in part by the 1968 Workshop by: 1) adapting, testing, and processing the research findings for ultimate program operations; 2) conducting field research studies; 3) assisting in the design of laboratory-based field surveys including direct service in sample collection and preparation for research; 4) providing design guidance for facility and equipment needs, and 5) consultation to Headquarters, Regions, States, etc. dealing with technical program operations. Based on need, objectives include pursuit of on-going Field Research and Development studies, initiation and expansion of some efforts in relatively new fields. Assistance in the areas of training, consultation on enforcement activities (P.L. 84-660), application of depuration, intramural field research, and laboratory appraisals will be given. This is a continuing project started in FY 1964 and will continue in accordance with the needs of the overall programs.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1076, EFFECT OF THE EFFLUENT FROM AN ATOMIC POWER PLANT ON THE ADJACENT PORTION OF BARNEGAT BAY, NEW JERSEY

J.L. VERBER, U.S. Dept. of Hlth. Ed. & Wel. , P.H.S. Ne. Mar. Hlth. Sc. Lab. , *Narragansett, Rhode Island*

The purpose of the project is to investigate and monitor certain aspects of an estuarine environment before and after the activation of an atomic power plant.

Through survey work baseline information will be collected to determine the normal physical and biological regime of Barnegat Bay and adjacent water courses. The survey work will be quarterly operations over years to determine the annual and seasonal variations. Survey work will continue after the reactor becomes operational in order to determine the effects of thermal pollution on the previous ecological baseline of the Bay.

Studies will include monitoring of the shellfish resource, temperature variations, salinity, collection of shellfish meats for radioactive background data, tidal fluctuations, circulation pat-

terns and gross plankton samples. Other studies will be made that are believed necessary due to changes in the environment or unusual circumstance.

Close cooperation will be maintained with other agencies maintaining operational programs in the area. Background data of pre-reactor conditions will be collected for analysis conditions.

5.1077, A STUDY OF SUSPECTED LEAD POISONING OF SWANS AND GEESE

M. PERRY, State Div. of Conservation, *Providence, Rhode Island*

Objectives: 1. To determine if lead shot is present in sediments of Easton Pond. 2. To determine the concentration of lead in the liver, tibia, and blood of all swan. 3. To determine if acid-fast intranuclear inclusion bodies are present in kidney tissue of all swan. 4. To study the feeding behavior of swans and geese on and near Easton Pond.

Procedures: 1. Sediment samples will be taken at random throughout Easton Pond in Newport, R. I. and analysed for lead shot contents. 2. All dead swans and geese will be collected and necropsied. Gizzards will be examined for lead shot. Blood, liver and tibia samples will be taken and lead concentrations in parts per million will be determined by use of an Atomic Absorption Spectrophotometer. Technique to be used will be similar to that described in 'Analytical Methods for Atomic Absorption spectrophotometry,' Perkin-Elmer, Norwalk, Connecticut. 3. Kidney tissue from all dead swans and geese will be examined to determine if acid-fast intranuclear inclusion bodies are present (Lock, Bagley, Irby 1966. Bull. Wildlife Disease Assoc. 2:127-131). 4. A comparison of lead concentrations will be made between birds at Easton Pond and resident birds from another part of the state.

Rhode Island State Government

5.1078, STORM SEWER TREATMENT BY A SELF-CLEANING STRAINER, FILTER CONCEPT

S.S. BLECHARCZYK, Fram Corporation, *Providence - East Providence, Rhode Island 02916*

The purpose of this study is to evaluate the self-cleaning strainer, filter concept for effective pollution reduction of combined sewer overflows.

It is intended to: 1. Determine the rate and nature of pollution experienced at a typical combined sewer overflow. 2. Determine screen construction most effective, with and without coagulants. 3. Determine the effectiveness of various septa and diatomaceous earth materials in removing pollutants from the strainer effluent.

The variables involved in the filtration concept will be investigated by bench tests using small area test fixtures and actual storm sewer samples. The effectiveness of continuous back-washing on screen plugging and water content of the filtered solids will be studied.

A number of adsorbents and coagulants will be used in conjunction with the two devices.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1079, REARING AND SENSITIVITY STUDIES OF VARIOUS LIFE STAGES OF MARINE MACROINVERTEBRATES

G. MORRISON, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab. , *Wakefield - Kingston, Rhode Island 02881*

The goal of this project is to determine the relative sensitivity of various stages of marine macroinvertebrates to specific materials and the evaluation of marine invertebrates as indicators of extreme levels of known toxicants over extended periods.

This work will eventually be incorporated in broader areas of research to determine the effects of these toxicants upon growth, reproduction, activity, metabolism, and the activity of hormones and enzymes.

The organisms studied to date are the first larval stages of *Callinectes sapidus*, *Carcinus maenas*, *Uca pugnator* (?), and *Palaemonetes pugio* and their reaction to various levels of copper.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.1080, HISTOPATHOLOGIC EFFECTS OF POLLUTANTS ON CELLS AND TISSUES OF MARINE FISHES
P.P. YEVIK, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

Histopathologic studies will be conducted on various species of marine fishes after exposure to pollutants. Studies presently are being conducted on mummichogs being exposed to Cd and Pb.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1081, HISTOPATHOLOGIC EFFECTS OF POLLUTANTS ON CELLS AND TISSUES OF MARINE INVERTEBRATES
P.P. YEVIK, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

Histopathologic studies will be conducted on various species of marine invertebrates: quahogs, soft shell clams, oysters, lobsters, shrimp, blue crab, etc. after exposure to various pollutants. Studies are presently being conducted in cooperation with the Northeast Marine Health Sciences Laboratory on quahogs (*Mercenaria mercenaria*) which have been exposed to 0.05 and 0.025 ppm of Cu, 0.2 ppm of Zn, 0.2 and 0.1 ppm of Cd and 0.05 and 0.1 ppm of Cr.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1082, EFFECTS OF CRUDE OILS AND THEIR EMULSIONS TO MARINE ORGANISMS
R. EISLER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Oil discharges at sea, especially accidental discharges by super-tankers, represent a potential threat to aquatic life. Laboratory bioassays on the acute toxicity of different grades of crude to various species of marine fishes and crustaceans are now in progress. The effect on toxicity of emulsifying or complexing the oil with various chemical agents is being investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1083, PHARMACOLOGY OF METAL POISONING IN ESTUARINE FISHES
R. EISLER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Pilot bioassays were conducted under laboratory conditions with mummichogs, *Fundulus heteroclitus*, against various metals abundant in solid wastes dumped off shore. Analyses by atomic absorption, and other methods, of mummichogs that died during exposure to high concentrations demonstrate measurable changes in elementary chemical composition. Tissues from fishes surviving sublethal exposures were also significantly different from controls in levels of one or more of the 25 metals measured. The significance of these changes in terms of environmental stress and metabolic pathways is being studied.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1084, COMPARATIVE TOXICITIES OF METALS TO ESTUARINE FISHES
R. EISLER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Disposal of solid wastes at sea is being practiced by an increasing number of municipalities. Preliminary analysis of incompletely-ashed incinerator wastes by atomic adsorption indicates that aluminum, iron, calcium, zinc, sodium, potassium, and lead--in that order--are most abundant. Short-term bioassays with inorganic salts of these and other metals to the mummichog, *Fundulus heteroclitus*, are being conducted under controlled environmental conditions. Relationships between mortality, physical-chemical environment, and concentration of test metal in solution is being investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1085, EFFECT OF NITRILOTRIACETIC ACID (NTA) UPON THE TOXICITY OF METALS TO SELECTED SPECIES OF ESTUARINE PHYTOPLANKTON
S.J. ERICKSON, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Laboratory studies will be conducted to determine the relationship of nitrilotriacetic acid (NTA), a metal chelator, to the toxicity of metals to selected species of estuarine phytoplankton. The metals employed in this study will be those which are known metabolic toxins and are of importance from the standpoint of estuarine pollution.

The toxicity of the various metals to six species of phytoplankton will be determined in the presence of several concentrations of NTA. In addition to growth rate, C14 labeled carbon dioxide will also be employed as a parameter for determining levels of metal toxicity.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1086, EFFECTS OF PETROLEUM AND PETROLEUM WASTES UPON IMPORTANT SPECIES OF ESTUARINE PHYTOPLANKTON AND ZOOPLANKTON
J.H. GENTILE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

The effects of petroleum and petroleum wastes upon important species of estuarine phytoplankton and zooplankton will be assessed. Assays on zooplankton will employ acute toxicity to various stages in the organisms' life history as the principal parameters. Assays on phytoplankton will involve the effects of pollutants on growth, photosynthesis, and respiration as well as mechanical effects such as cell lysis. Comparative toxicity of different types of petroleum products will be investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1087, INTEGRATED FIELD AND LABORATORY SYSTEM FOR ASSAYING THE EFFECTS OF POLLUTANTS AND TOXICANTS UPON WATER QUALITY
J.H. GENTILE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

The purpose of this project is to investigate the effects of pollutants and toxicants on natural populations of marine phytoplankton as well as on axenic cultures of selected species comprising these populations. Assays will be performed in natural and defined seawaters in such combinations as to obtain a continuum of responses. Laboratory cultures will be designed to simulate field conditions. Measurement of photosynthesis and respiration rates using radioactive carbon will be the principal technique employed and will be correlated with long-term growth studies.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1088, DEVELOPMENT OF A METHOD FOR CHRONIC TOXICITY BIOASSAY USING MARINE PLANKTONIC ALGAE
C.S. HEGRE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Objectives: To develop a method which will permit exposure of algal populations to constant low levels of test compounds, as well as monitoring of population dynamics or metabolic effects.

Procedures: 1. 2. Normal population dynamics and optimal medium exchange rates will be determined. 3. The utility of the apparatus will be tested by determining minimal requirements for a few known nutrients.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1089, STUDY OF NITROGEN METABOLISM IN MARINE ALGAE
C.S. HEGRE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

5. WATER QUALITY MANAGEMENT AND PROTECTION

Objectives: To develop a method based on in vivo enzymatic activity which can be used as a bioassay parameter in determining the biological effects of potential pollutants.

Procedures: 1. An in vivo system for the assay of nitrite reductase activity in marine algae has been established. 2. Environmental factors which influence the expression of nitrite reductase activity will be investigated. 3. Cells preexposed to test compounds will be assayed for nitrite reductase activity. The results of such studies will be compared as indicators of biological effect with those of similar studies in which growth is measured.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1090, MEASUREMENT OF THE RATE OF CARBON DIOXIDE (C14) FIXATION INTO SUBCELLULAR FRACTIONS OF ALGAE

C.S. HEGRE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Objectives: To develop a rapid and sensitive method for detecting the metabolic effects of potential pollutants on cultures of marine algae.

Procedures: 1. Existing procedures for fractionating cells into classes of chemical constituents are being modified to permit processing of many small samples of algae. 2. Optimal labelling conditions and normal incorporation rates will be determined for each fraction. 3. Cultures preexposed to test substances will be allowed to fix Carbon-14 labeled CO₂. The cells will then be fractionated, and rates of synthesis of each fraction will then be determined from isotope incorporation data. Results will be correlated with those of similar studies using growth rate as the measure of biological effect.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1091, EFFECT OF METAL POISONING ON VARIOUS ENZYMES IN FISH

E. JACKIM, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

The present phase of the work is a study on the effects of various metals on the ATPase enzymes; namely the Na plus K dependent moiety (ouabain sensitive) and the Na plus K non-sensitive ATPase. ATPase was chosen because the metal requirements for these enzymes are very specific and because of previous evidence that they are poisoned by sulfhydryl inhibitors. We believe that this enzyme might be involved in heavy metal toxicity and may be an indicator of chronic metal poisoning. The study is divided into two parts. The first was to observe the effects of adding various metal salts to partially purified enzyme preparations and determining the changes in activity. The second phase consists of exposing living killifish to heavy metals and determining any changes in the enzyme activity of several different tissues. The results of the first phase of the study indicate that the ouabain sensitive ATPase is very sensitive to some of the metals. One ten-thousandth M lead, mercury, cadmium and iron will produce a 90%-100% inhibition.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1092, HEMATOLOGICAL CHANGES IN F. HETEROCLITUS UPON EXPOSURE TO TOXIC METALS

E. JACKIM, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Killifish are exposed to various toxic metals for 96-hr. and 30- days periods. The fish are killed and hematological tests conducted to observe and change in the differential blood count. Hematocrit and blood cell morphology are also compared to that of control fish. Normal seasonal, sex and size variations are also correlated to changes in the blood picture. Cadmium and lead are now under investigation. Cadmium shows a marked eosinophilia while the effects of lead are more subtle. Cadmium also appears to increase the hemoglobin and hematocrits in *F. heteroclitus*.

The blood morphology in other species of salt water fish is also being studied.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1093, USE OF MARINE PLANKTONIC ORGANISMS FOR EVALUATING THE QUALITY OF MARINE AND ESTUARINE WATERS

T.E. MALONEY, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

This project is concerned with the development of bioassay methods and techniques, employing various species of marine phytoplankton and zooplankton, for determining the toxicity and identity of pollutants in the marine environment and for determining and predicting the short- and long-term effects of lethal and sublethal concentrations of pollutants upon planktonic organisms and other organisms in the marine environment.

The test species will include those which are ecologically important and, in the case of zooplankton, their various life stages.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1094, DETERMINATION OF SELECTED ENVIRONMENTAL REQUIREMENTS OF IMPORTANT MARINE PHYTOPLANKTON SPECIES

J.C. PRAGER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Studies have been initiated to determine minima, optima, and maxima of selected physical and chemical requirements of four ecologically and economically important species of unicellular marine algae. Requirements considered in this program are nitrogen, phosphorus, sulfur, and silicon; also temperature, light, major cations, and redox. Methods used on axenic cultures in synthetic seawater media are growth studies, radioisotopic tracer techniques, chemostatic culture and continuous culture techniques, and various physical methods of measuring environmental changes. Species studied are *Skeletonema costatum*, *Olisthodiscus luteus*, *Nanochloris oculata*, and *Dunaliella tertiolecta*.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1095, THE NORMAL ANATOMY AND HISTOLOGY OF SOME MARINE INVERTEBRATES

J.H. TUCKER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Initial literature studies of the anatomy and histology of some of the important marine invertebrates indicated that 'wide gaps' appear in the literature concerning the normal histology of some of these species. The purpose of this study is to fill in these 'gaps' and compile the information of a monograph.

The species under study at the present time are the quahog, *Mercenaria mercenaria*, and the soft shell clam, *Mya arenaria*. Other species to be studied are *Homarus americanus*, *Mytilus edulis*, *Crassostrea virginica* and other species which may be utilized in pollution studies.

Preparation of histological sections utilizing routine and special fixation and staining techniques are in progress and photomicrographic records of the information obtained are being compiled. Special techniques such as histochemistry and fluorescence microscopy are to be utilized.

5.1096, DEVELOPMENT OF CULTURE METHODS FOR ECOLOGICALLY IMPORTANT MARINE ZOOPLANKTON SPECIES

E.J. ZILLIOUX, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Methods to culture large numbers of individuals of *Acartia tonsa*, *A. Clausi*, *Pseudodiaptomus coronatus*, *Tisbe furcata*, *Calanus* sp., and *Tigriopus californicus* are being devised and tested in conjunction with another project concerned with environmental requirements of these species. Desiderata are the production of large numbers of individuals in a minimal volume of medium, successful completion of life cycles through several generations, elimination of undefined chemical compounds from the medium, simplicity of apparatus, definition of food materials, and ability to operate on a continuous basis.

5.1097, DETERMINATION OF SELECTED ENVIRONMENTAL REQUIREMENTS OF IMPORTANT SPECIES OF MARINE ZOOPLANKTON

E.J. ZILLIOUX, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Acartia tonsa, *A. clausi*, *Pseudodiaptomus coronatus*, *Calanus* sp., *Tisbe furcata*, and *Tigropus californicus* are undergoing experimentation to determine optimal conditions of temperature, salinity, oxygen saturation, and food materials for successful completion of their life cycles. Organisms are cultured and subcultured in the laboratory under small volume, static conditions. End points and condition of cultures are determined by microscopic examination of life cycle progress, in some experiments using time-lapse photography.

5.1098, RADIONUCLIDES IN THE SAVANNAH RIVER ESTUARY AND ADJACENT COASTAL WATERS

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

Small amounts of radionuclides are released to the Savannah River by the Savannah River Plant 170 miles from the Atlantic Ocean. The distribution of radionuclides in the river's estuary and in adjacent coastal waters is being determined. Effects of water exchange between the estuary and ocean, sedimentation and other physical and chemical factors influencing dilution and distribution will be studied. The coastal waters are being analyzed for tritium, ⁹⁰Sr and ¹³⁷Cs. Sediments are being analyzed for ⁹⁰Sr and ¹³⁷Cs.

SUPPORTED BY U.S. Atomic Energy Commission

5.1099, RADIONUCLIDE MOVEMENT IN GROUNDWATER

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

Large volumes of very low level radioactive wastes are discharged to earthen seepage basins. We are studying both the horizontal and vertical distribution of radionuclides in the groundwater between earth seepage basins and the nearest flowing stream. The flow path to the creek has been defined using the tritium in the waste as a tracer. Other than tritium only ⁹⁰Sr has migrated from the basins. Wells will be screened at various depths below the water table to determine the vertical distribution of radionuclides in the groundwater.

SUPPORTED BY U.S. Atomic Energy Commission

5.1100, IMPROVED DETECTION TECHNIQUES TO DETERMINE RADIONUCLIDES IN FRESH AND SEA WATER

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

New sensitive radiochemical methods are being developed to qualitatively and quantitatively determine radionuclides in fresh and sea water. Trolled mixed resin ion exchange canisters have been successfully tested for rapid concentration of radionuclides in both fresh and saline water. Ammonium hexacyanocobalt ferate, an inorganic ion exchanger, has been shown to be useful in the determination of radiocesium in water. A multiparameter programmed gamma analyzer, which will increase sensitivity by a factor of 100 will be constructed this year.

SUPPORTED BY U.S. Atomic Energy Commission

5.1101, CHARTING OF SUBTIDAL OYSTER BEDS AND EXPERIMENTAL TRANSPLANTING OF SEED OYSTERS FROM POLLUTED SEED OYSTER BEDS

G.R. LUNZ, State Div. of Comm. Fisheries, Charleston, South Carolina 29401

The South Carolina oyster industry is based almost entirely on intertidal oysters, yet subtidal beds do exist. Two such beds are known to produce more seed per unit of area than the famous

James River, Virginia, seed beds. In the past, attempts to expand the growth of oysters subtidally have not been entirely successful. However, by locating areas with comparable environmental conditions to existing deep water beds, and by transplanting deep water seed to them, an attempt will be made to demonstrate a way to expand the industry.

Exploration for deep water growing sites in the more than 3200 miles of creeks and rivers within the State will begin as soon as the project can be activated. Several hundred bushels of seed oysters from the Wando and the Santee Rivers (existing deep water beds) will be moved to the new locations. Survival, growth, and quality of these transplanted oysters will be studied by regular sampling.

Continuing the program next fiscal year, larger amounts of oysters will be moved to test the possibility of introducing a system of oyster culture not now being practiced.

A two man team, yet to be employed, will conduct the survey. The entire project will be under the supervision of Bears Bluff Laboratories.

5.1103, KINETICS OF BIOLOGICAL FILTERS

J.F. ANDREWS, Clemson University, School of Engineering, Clemson, South Carolina 29631

Since the trickling filter is an aerobic biological treatment process which depends upon the action of attached microorganisms for the removal of organic waste products, the overall process may be represented by the simplified reaction equation: ORGANISMS SUBSTRATE OXYGEN yields NEW CELLS METABOLIC WASTE PRODUCTS.

It is the objective of this research project to study the kinetics of biological filters by observing the influence of the three reactants on the rate of removal of organic products by attached microorganisms and use this data to evaluate a proposed mathematical model for trickling filters. In view of the fact that the microbial population of a trickling filter is responsible for the removal of organic waste products, it should be possible to express this removal in terms of microbial growth kinetics.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1104, WASTE DISPOSAL FROM FOOD PROCESSING PLANTS IN SOUTH CAROLINA

J.R. LAMBERT, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

The objective of this master project which is concerned with water resources is to determine the effectiveness of the soil mantle for purification of waste water from food processing plants. This will be done by studying the effect of the application of waste water on the hydrologic conductivity of the soil, and by studying the effects of various waste disposal application treatments on the quality of downstream flow. The interrelationships of engineering, agronomic, microbiological, meteorological, and climatic factors required for proper design and operation of an efficient and safe system for distributing waste on the surface of South Carolina soils will also be determined. Waste water from a pilot food processing plant will be applied at different application rates and intervals to lysimeters constructed of undisturbed soil with

5. WATER QUALITY MANAGEMENT AND PROTECTION

various vegetative covers and the quantity and quality of seepage will be measured. Lysimeters containing disturbed soil will be used to study the effects of soil properties, soil depth, and rate of application of the waste water on composition of the percolate from the soil and the effects of the waste on the physical and chemical properties of the soil.

5.1105, THE USE OF TAXES, SUBSIDIES, AND REGULATIONS TO CONTROL THE EFFLUENT OF THE TEXTILE INDUSTRY

H.H. MACAULAY, Clemson University, Graduate School, *Clemson, South Carolina 29631*

The purpose of the project will be to determine the differential effects of taxes, subsidies, and regulations on the use of water and the discharge of effluent by the textile industry. More specific objectives will be: 1. To estimate the economic values of nonmarket uses of water downstream from certain textile mills. 2. To determine the difference in economic results that stem from (a) regulations imposing higher stream standards, (b) a system of user charges or taxes, and (c) a system of subsidies. 3. To determine if a tax subsidy given at the local level (primarily by exemption from property taxes) differs in principle from a tax subsidy given at the national level (primarily by special deductions under the income tax). 4. To assess the difference in economic impact of higher stream standards on old mills and on new mills. 5. To estimate how the cost of cleaning up the effluent from the textile industry may affect the methods of processing textiles or lead to the development of new technology.

A theoretical model to provide for the optimum use of the resource will be constructed. An attempt will then be made to gather data which will make it possible to apply the model to the textile industry. Assumptions as to differences in taxes, subsidies, and regulations will be made to see how the use of water and the operation of the textile industry are changed by each of these conditions.

5.1106, THE REMOVAL OF IMPURITIES IN TRICKLING FILTER EFFLUENTS

W.M. MCLELLON, Clemson University, School of Engineering, *Clemson, South Carolina 29631*

Over the past ten years application of electrophoretic mobility measurements in control of water treatment processes has been investigated by Black and associates and Riddick, primarily, under various conditions using natural or synthetic waters. It is considered materially in improving efficiency of removal of impurities in both secondary and tertiary waste treatment.

It is planned, as a first step, to examine the colloidal properties of the particulates in a trickling filter effluent, using the effluent from Clemson University waste treatment plant, both before and after passage through the final clarifier. This plant discharges to a large impoundment which is used for water supply and recreation. Investigation of the chemical properties of the waste from the sampling points will be a necessary adjunct to the electrophoretic mobility measurements and microscopic examination of the particulates. Initial work will be extended to include treatment of the trickling filter effluent using coagulants, such as ferric sulfate, and further investigation of the colloidal properties, to obtain information on the conditions for optimum removal of impurities, along with the use of zeta potential as a control process in treatment.

5.1107, INTERACTION OF PESTICIDE POLLUTANTS AND AQUATIC FOOD-CHAIN ORGANISMS

J.K. REED, Clemson University, Graduate School, *Clemson, South Carolina 29631*

This research project plans a field project to determine the distribution of DDT in one area of Lake Hartwell which is contaminated with DDT at a moderate level. The concentrations of DDT in water, plankton, fishes, benthos, and the substrate will be used to estimate the portion of DDT residing in each component of the environment. Samples of water and organisms from near the surface to near the bottom, plus bottom mud will be analyzed chemically for DDT content. The sampling will be distributed throughout a year.

A laboratory component of the study will be to assess the principal route of entry of DDT into an aquatic consumer organism (integument vs. food chain). Fish will be administered a dosage of DDT in food and an equivalent dosage in water, then by both routes at the same time. Chemical analysis by chromatography plus radiometric determination of labelled DDT will be used to indicate the importance of each route of entry, both separately and in combination.

5.1109, GROUND WATER CONTAMINATION RESULTING FROM WASTE DISPOSAL

J.R. ANDERSEN, South Dakota State University, School of Engineering, *Brookings, South Dakota 57007*

Representative waste disposal methods in South Dakota including land disposal of liquid and solid wastes will be investigated to determine: 1. A recommended procedure for selection of waste disposal sites in order to minimize ground water contamination problems. 2. The effects of waste disposal practices including: a. The nature and extent of ground water contamination. b. The effect of ground water contamination on proposed beneficial uses. c. The influence of such factors as climatic conditions, soil types and waste characteristics on the degree and extent of travel of pollutants. 3. A means of combatting undesirable contamination of the ground water.

It is also proposed that the project will investigate the long term effects of solid waste landfill on ground water quality in an area where adequate background data have been collected to observe the initial influence.

5.1111, CHEMICAL BIOCIDES IN LAKES

Y.A. GREICHUS, South Dakota State University, Agricultural Experiment Sta., Brookings, South Dakota 57007

Objectives: 1. To determine the levels of chemical biocides in the ecosystem of a prairie lake (Lake Poinsett). 2. To study the effects of these chemicals on the ecosystem of this lake.

Work Proposed: Plant and animal species of the food chain of the lake fish will be collected at the inlet and outlet areas, the littoral zone, the transition zone and the settling basin zone. The species will be identified and analyzed for pesticides. The fish, also, will be analyzed for pesticides.

SUPPORTED BY South Dakota State Government

5.1112, FABRICS AND WATER PROBLEMS

L.O. LUND, South Dakota State University, Agricultural Experiment Sta., Brookings, South Dakota 57007

Effect of water of various degrees of hardness and mineral content on fabrics composed of cotton, chemical fibers and blends of fibers.

Effect of different methods of laundering used by a selected group of homemakers in water problem areas.

It is planned to work with extension personnel in determining where the serious laundering problems exist and in securing women who are interested in cooperating with the station workers. Some type of garment, such as a white slip, made of chemical and natural fibers will be selected by the station staff. These garments will be distributed to women in various counties to be worn and laundered along with their other apparel. The garments will be returned to the laboratory periodically for examination.

Laboratory work will parallel the wear study in determining methods of overcoming problems due to excessive mineral salts. Evaluation of fabrics will consist of visual observation, reflectometer readings for whiteness and microscopic inspection. When garments are withdrawn from wear further laboratory evaluation may include stiffness, residual strength, elongation, weight and thickness, dimensional stability and wrinkling.

5.1113, BACTERIOLOGICAL WATER QUALITY ANALYSES OF METHODS FOR DETECTING FECAL POLLUTION

P.R. MIDDAGH, South Dakota State University, School of Agriculture, Brookings, South Dakota 57007

The proposed research involves laboratory and field investigations to improve the specificity, speed and reliability of bacteriological methods for determining kinds and number of fecal bacteria in surface water resources. The main objective is to develop bacteriological methods to distinguish between human versus animal sources of pollution by fecal indicator and pathogenic bacteria.

Laboratory investigations: 1. Fecal bacteria isolated from water samples would be used to evaluate modified bacteriological methods designed to detect differences in kinds and numbers of coliform, fecal coliform and especially fecal streptococci of human versus animal sources. 2. Samples of polluted surface waters would be stored in controlled laboratory environments to determine the relative rates of die-off coliform, fecal coliform, fecal streptococci and fecal pathogens e. g., salmonellae.

Field investigations would employ the bacteriological methods to determine the ratio of numbers of fecal coliforms and fecal streptococci in the same sample of selected stream and lake waters. This ratio has been reported to distinguish between human and animal fecal bacteria.

Laboratory and field data would be correlated for practical application in attempts to trace sources of fecal bacterial pollution of surface water resources and to attempt to distinguish between human and animal wastes with emphasis on farm animal wastes.

5.1114, CHEMICAL, PHYSICAL, AND BIOLOGICAL DYNAMICS OF NORTHERN PRAIRIE LAKES

J.G. NICKUM, South Dakota State University, School of Agriculture, Brookings, South Dakota 57007

The research plan proposes to make it possible to describe the chemical, physical, and biological dynamics of heretofore unstudied lakes. This will provide information concerning the relationship between land use and water quality of lakes.

The project will study the present, the seasonal variation, and the possible year to year variation of water quality. This will be accomplished by biweekly sampling during June, July, and August, and monthly throughout the remainder of the year. In addition, samples of water flowing into the lakes will be taken whenever rainfall is sufficient to cause a runoff into each lake.

The chemical content of the water will receive special attention in that the levels of various chemical biocides in the ecosystem will be determined. Pesticide residues will include endrin, dieldrin, aldrin, heptachlor, heptachlor epoxide, DDT, DDD, DDE, lindane, toxaphene, and the chlorophenoxy compounds. Pesticide residues will be extracted from five types of materials including water, mud, plant material, small aquatic animals and fish.

The field data will be used to provide information concerning the relationship between land use and the dynamics of a lake.

5.1115, INSECTICIDE RESIDUES ON ALFALFA

R.J. WALSTROM, South Dakota State University, Agricultural Experiment Sta., Brookings, South Dakota 57007

Objectives: 1. Determine the fundamental physical, biochemical, and biological factors influencing occurrence, magnitude, interaction, and persistence of insecticidal chemical residues in soils and raw agricultural commodities.

2. Identify and evaluate fundamental factors influencing the magnitude and mechanism of air and water pollution by insecticidal chemical residues.

3. Develop basic studies related to the metabolism and detoxication of insecticidal chemical residues in animals, plants, soils and water.

4. Identify and evaluate the effects of residues of insecticidal chemicals on ecosystems with special emphasis on fish and wildlife.

5. Explore the reciprocal influences of residues of insecticidal chemicals on soil microflora, microfauna, and non-insect fauna.

6. Seek methods of removing or reducing residues of insecticidal chemicals from the environment.

7. Develop and improve analytical techniques essential to the pursuit of this research.

5.1117, EFFECTS OF THE CHLORINATED HYDROCARBONS, ALDRIN AND DIELDRIN, ON FRESHWATER SEED SHRIMP (OSTRACODA)

J.C. SCHMULBACH, Univ. of South Dakota, Graduate School, Vermillion, South Dakota 57069

The proposed research involves laboratory investigations directed toward determining the acute and chronic effects, the degree of accumulation, and the site of accumulation of two widely-used chlorinated hydrocarbon insecticides, aldrin and dieldrin, on freshwater seed shrimp, primarily *Chlamydotheca arcuata* (Sars).

Laboratory investigations will include the following procedures:

1) Median tolerance limits will be determined for both insecticides on seed shrimp using a constant-flow, serial-dilution apparatus.

2) Chronic poisoning and the question of acquired resistance and/or induced sensitivity will be studied by long-term exposure to sub-lethal insecticide doses.

3) Exposure to C14 labeled aldrin and dieldrin followed by tissue extraction and radiological analyses will indicate the degree of gross insecticidal accumulation and tissue concentration. Gas chromatography will be employed to confirm these analyses.

4) Organisms subjected to lethal doses of the radioactive toxicants will be fixed, embedded, serially sectioned and subjected to autoradiographic analysis to reveal the anatomical localization of insecticide.

5.1118, EFFECTS OF DEVELOPMENT ON WATER QUALITY

M.A. CHURCHILL, U.S. Tennessee Valley Auth. , Knoxville, Tennessee

Research will be conducted in an effort to determine the physical, chemical, and biological effects of various land uses on the quality of the through-flowing streams. Some types of coliforms normally live in the soil and on vegetation. These coliforms are not really indicative of pollution although they are occasionally interpreted as such. Research will be conducted on controlled land uses to determine the contribution of fecal and non-fecal coliforms from various types of soils and types of land cover. As an aid in assessing the extent of eutrophication, an evaluation will be made of nutrient contributions to streams and reservoirs from land areas having various forms of vegetal cover. Research will be conducted on controlled agricultural areas to determine what percentages of various insecticides used are washed off the land by rainfall to enter the receiving streams.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1119, FACTORS INFLUENCING THE PRODUCTION OF PLANKTONIC AND BENTHIC PLANTS

M.A. CHURCHILL, U.S. Tennessee Valley Auth. , Knoxville, Tennessee

The role of factors that control rates of growth and total standing crop of both planktonic and benthic plants will be studied in streams and reservoirs. These studies will evaluate effects of the following factors in growth rates under field and, in some cases, laboratory conditions: (a) various nutrient levels; (b) interaction of communities due to excretion of extracellular metabolites or competition for nutrients; (c) the source of nutrients in streams and reservoirs whether from land areas having various forms of vegetal cover, or from waste discharges; (d) substrate types; (e) light penetration; (f) reservoir operation and hydraulic flow characteristics; and (g) other physical and chemical characteristics of the flowing or impounded waters. A prediction equation that will include and define the relative importance of the significant factors will be developed, based on a multivariate analysis of the data.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1120, TEMPERATURE DISTRIBUTION IN THE VICINITY OF WASTE HEAT DISCHARGES

M.A. CHURCHILL, U.S. Tennessee Valley Auth. , Knoxville, Tennessee

Research will provide means for predicting temporal and spatial distribution of excess heat in streams receiving condenser cooling water from steam-electric generating plants. This involves development of correlations for describing and predicting cooling rates based on meteorological data. The study also includes the development of mathematical models which account for the combined effects of cooling and mixing in rivers and reservoirs. There is particular interest in situations where the warm water, due to its lower density, stratifies in the surface layers of the receiving stream or reservoir and there loses much of its excess heat to the atmosphere before mixing takes place. Extensive data have been collected for such a thermally stratified river. Heat is distributed across the river immediately below the discharge allowing the situation to be analyzed as two dimensional.

Several more complex situations will provide data for the evaluation of temperature distribution in three dimensions. This situation occurs when discharge is into a reservoir or larger river. Data obtained below existing power plants will be used in developing and verifying the prediction methods.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1121, EFFECTS OF TEMPERATURE ON AQUATIC LIFE

M.A. CHURCHILL, U.S. Tennessee Valley Auth. , Knoxville, Tennessee

Research is being conducted to provide sound technical bases for development of realistic temperature control criteria for maintenance and propagation of aquatic life. The effects of temperature on the quality and quantity of economically important species and their supporting food chain will be studied. Laboratory studies have been initiated to determine lethal temperatures for nine species of locally important fish and several fish-food organisms. It is planned to construct eight large channels simulating natural waterways. In these channels, normal biotic situations will prevail except for water temperatures. Heated water will be obtained from the condenser discharge of a large steam-electric power plant and mixed with unheated lake water to maintain desired temperatures in the channels. Two channels will be used for controls.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1122, EFFECTS OF IMPOUNDMENT ON WATER QUALITY

M.A. CHURCHILL, U.S. Tennessee Valley Auth. , Knoxville, Tennessee

Research is being conducted to develop engineering methods which can be used in planning, designing, and operating river and reservoir water control structures associated with multipurpose water resource projects for management of water quality as well as water quantity. Specifically, the water quality management problem consists of developing methods for predicting the quality of the water to be released through low-level outlets of proposed and existing impoundments and determining the feasibility of modifying the design and operation of water control structures to improve the quality of water discharged. Data are being collected and analyzed to determine the physical, biological, and chemical variables that cause the low dissolved oxygen concentrations and other undesirable water quality characteristics.

The Engineering Laboratory is engaged in a program directed toward developing methods of predicting water temperatures and flow patterns upstream from, within, and downstream from existing and proposed reservoirs for a given reservoir inflow-outflow program.

5. WATER QUALITY MANAGEMENT AND PROTECTION

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1123, WATER QUALITY CONTROL

R.A. ELDER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

TVA is conducting research to develop engineering methods which can be used in the planning, design, and operation of river and reservoir water control structures associated with multipurpose water resource projects for management of water quality as well as water quantity. Specifically, the water quality management problem consists of developing methods of predicting water temperatures, dissolved oxygen concentrations, and flow patterns upstream from, within, and downstream from existing and proposed reservoirs for a given reservoir inflow-outflow program, including the effects of locating thermal or other industrial plants upstream from, on, or downstream from the reservoir. The ultimate goal of this research is to provide information needed to operate river and reservoir systems so as to make the best possible use of the water from the standpoints of quality and quantity.

The Engineering Laboratory is presently engaged in a broad program of water resource structure studies aimed at solving some of these problems. During 1965, studies were conducted of the thermo hydrodynamics of the flows through many of TVA's existing reservoirs from which a procedure was developed for making fairly accurate predictions of the mean water temperature of the reservoir outflow. During 1966, the reservoir studies were expanded in an effort to combine the TVA procedure with a mathematical model of reservoir stratification based on vertical eddy diffusivity which was developed independently by one of the Laboratory's consultants.

The combined model was programmed for solution by digital computer and is being checked. Important adjuncts to these basic studies are comprehensive field studies which are undertaken to verify the developed methods. To obtain simultaneous data on the many important factors which influence the temperature and certain other water quality characteristics of the outflow from a stratified reservoir, an intensive one-year study was made at TVA's 29-mile-long, 450-foot deep Fontana Reservoir in 1966.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1124, COAL STRIP MINE WATERSHED DEMONSTRATION--JACKSON COUNTY, ALABAMA

K.J. SEIGWORTH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

The demonstration-research watershed was established in June 1968 to determine how area coal strip-mining and subsequent reclamation practices will affect the water resource and aquatic life of a small 136-acre watershed in northeast Alabama. Farco Mining Company is cooperating in the study.

Hydrologic observations include precipitation, streamflow, water temperature, and sediment. Samples for complete water-quality are being secured. In addition, ecological studies of aquatic life in and adjacent to the stream are being conducted.

The project will be conducted in three phases: (1) a calibration period of approximately two years, (2) an action phase during which about 50 percent of the watershed will be mined, and (3) a recovery period following reclamation work on the stripped areas. Current reclamation provisions included in TVA coal contracts will be reviewed in the light of data obtained from the project.

SUPPORTED BY U.S. Tennessee Valley Auth.

5.1125, MOVEMENT AND PERSISTENCE OF HERBICIDES IN THE SOIL

E. ANDREWS, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

Objectives: To determine the effects of climatic and edaphic factors on movement, persistence and toxicity of herbicides in the soil.

Procedures: For a more detailed explanation, see S-18 (Revised) dated July 1965. Soil columns representing several soil types will be constructed in the laboratory. These columns will be

treated with herbicides and then varying amounts of simulated rainfall applied. Bioassays will be conducted to determine the depth to which the herbicides are leached in phytotoxic concentrations. Similar studies will also be conducted under field conditions.

To establish the pattern of herbicide dissipation in the soil under field conditions, field plots will be treated at recommended and higher rates. Plots will be sampled and bioassays conducted. These treatments and samplings will be conducted over a period of several years.

5.1126, SEASONAL AND DIURNAL ASPECTS OF ZOOPLANKTON MICRODISTRIBUTION AND VERTICAL MIGRATION IN RELATION TO WATER POLLUTION

D.L. BUNTING, Univ. of Tennessee, Water Resources Research Ctr., Knoxville, Tennessee 37916

The proposed research involves the study of microdistribution and vertical migration patterns of freshwater zooplankton populations in relation to physical and chemical environmental factors. Seasonal and diurnal changes in distribution will be analyzed to determine the effects of various environmental parameters associated with pollution.

Collection of data: (1) Diurnal studies based on six-hour sampling intervals, will be made throughout the year with special emphasis on the following periods; the onset of stratification, summer stagnation, fall overturn, winter isothermy, and spring overturn. (2) Weekly plankton and environmental determinations will be made to formulate a continuous picture of the changing conditions of the habitat. (3) Physical and chemical determinations will include light penetration, turbidity, temperature, oxygen, pH, alkalinity, carbon dioxide, conductivity, and total dissolved solids.

Analysis of data: Numerical plankton data will be subjected to correlation and multivariate analysis.

University of Tennessee

5.1127, EFFECTS OF WATER POLLUTION ON ZOOPLANKTON

D.L. BUNTING, Univ. of Tennessee, Graduate School, Knoxville, Tennessee 37916

Because of the lack of information dealing with the tolerances and reproductive rates of zooplankton species in polluted waters, it is planned to 1) provide estimates of the median tolerance limits of planktonic rotifers, cladocerans, and copepods to insecticides and toxic materials found in domestic and industrial wastes, 2) to measure the effect of sublethal concentrations of toxic wastes on the reproductive rates of natural and laboratory populations of planktonic rotifers, cladocerans, and copepods, and 3) to determine the growth patterns of several important planktonic rotifers, so that immature specimens may be segregated from adults in the egg/female/day estimates of reproduction. It is expected that the median tolerance limits based on long term studies will contribute to the study of water quality criteria. And that the knowledge of tolerances and reproductive rates along with critical study of standing crops will further the understanding of changes in community structure brought about by the addition of toxic materials to natural water.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1128, AN INVESTIGATION OF THE EFFECT OF CONTROLLED RELEASES ON THE PHYSICAL, CHEMICAL AND BACTERIOLOGICAL CHARACTERISTICS OF FORT LOUDON RESERVOIR

F.C. LARSON, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

Stratification occurs in many streams and impoundments. In this study, it is desired to determine whether large, sudden releases from upstream impoundments will affect stratification in a large downstream reservoir. Inasmuch as it is difficult to

5. WATER QUALITY MANAGEMENT AND PROTECTION

duplicate the prototype in the laboratory, all data will be collected from the prototype, (This becomes possible because all the impoundments are a part of the TVA system.)

It is proposed to collect all basic data (D.O., B.O.D., temperature, pH, conductivity, turbidity, color, suspended solids, and coliform count) before, during, and after the controlled releases. The data so collected is to be used to develop formulations for stratification prediction.

In addition to the stratification study, base line data on phosphates and the nitrogens (ammonia, nitrite, nitrate) are being secured from the reservoir.

University of Tennessee

5.1129, CHANGES IN WATER QUALITY PARAMETERS OF RESERVOIRS DURING REGULATED FLOW CONDITIONS

F.C. LARSON, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

Weekly sampling and testing is to be done at ten stations in Fort Loudoun Reservoir, Tennessee (a T.V.A. impoundment). The following tests will be made on all samples: The coliform count (membrane filter technique), pH, conductivity, dissolved oxygen, biochemical oxygen demand, apparent and centrifuged color, suspended solids, chlorides, iron, manganese, phosphates, ammonia N, nitrite N, nitrate N, and organic N. A portable continuous recording monitoring system will also be used in this investigation.

Inasmuch as the total organic loading on the reservoir will be greatly reduced this year, changes in water quality can be recorded and compared with previous results.

Additional information on iron and manganese build-up and eutrophication in a river-lake regime will be obtained and studied.

5.1130, TURBULENT MIXING IN SUBMERGED FLUID JETS

F.N. PEEBLES, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

This project is concerned with turbulent mixing mechanisms which result as a stream of water bearing soluble or thermal pollutants is discharged into a second stream. The research is directed to provide fundamental information useful for engineering predictions of the pollutant concentration in the vicinity of the stream junction. Such information will be directly applicable to devising solutions to problems of thermal pollution which now exist in the streams and lakes in the Southeastern United States.

The research has involved simulation of water flows by investigating the turbulent mixing of a high velocity air jet with ambient air. Earlier experiments were performed to measure attenuation of the velocity, temperature, and concentration excess of the inlet jet. The current phase of the research involves investigation of the local turbulence in the submerged jet flows. A parallel investigation of the turbulence in the boundary layer of a pipe entrance region is being conducted to aid in the analysis of the more complicated jet mixing flow.

During the past year the investigation of the turbulent flow in the entrance region of a pipe was essentially completed, the experimental methods for turbulence measurements in the wall-jet wind tunnel were worked out, and modifications of the constant temperature hot wire anemometer to permit measurements in the large-turbulence flow field were completed.

5.1131, LAND FORMING FOR DRAINAGE AND FURROW IRRIGATION

J.I. SEWELL, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

1. To make cost analyses of land forming operations, drainage ditch layouts, and pumping plant installations. 2. To

determine maintenance requirements, operation costs, and longevity of the drainage system. 3. To determine furrow irrigation efficiency and effect on crop yields.

During the Fall of 1962, the land forming and ditching operations will be carried out at the West Tennessee Experiment Station according to the plans developed in cooperation with the Soil Conservation Service. The amount of sediment removed and the change in cross-section of the ditches will be determined annually. An attempt will be made to relate sedimentation to the climatological data available at the station. Comparisons will be made between the yields and crop quality from irrigated and un-irrigated treatments.

To make accurate cost analyses, records will be kept of man-hours for labor and supervision, materials used, kind of machinery and equipment used and days of use, amount of soil moved and distance moved, depths of cuts and fills, and any other data needed for computing costs.

SUPPORTED BY Tennessee State Government

5.1132, EFFECT OF POLLUTING AGENTS ON SURVIVAL OF INDICATOR ORGANISMS

J.D. WOMACK, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

The Distribution and survival of enteric pathogens, especially *Salmonella* and *Shigella* species, in Fort Loudoun Lake, TVA, is being investigated. This study is intended to correlate with previous work on survival of indicator organisms in the same environment. Incidental occurrence versus time will be studied. Dye tracer techniques will be used to establish time of flow. Diffusion cell techniques will be used in the lake to confine and control pathogenic cultures and laboratory survival studies may also be needed.

Bacterial indicators will continue to be studied and correlated with zooplankton density and distribution in a joint study with the Zoology Department. The *Cladocera*, *Daphnia retrocurva* and *D. parvula* will be correlated with bacterial indicators and physical and chemical parameters in Fort Loudoun Lake. It is intended to show relationships between these organisms and the changes in water quality effected by self-purification in the lake.

The effects of Nitrogen nutrient levels on growth and persistence of Enterococci will be studied jointly with the Microbiology Department. Variations in enterococcus concentrations in a small unpolluted lake will be correlated with variations in nitrogen nutrient levels occurring seasonally. Laboratory growth studies will also be performed.

5.1133, SURVIVAL OF INDICATOR ORGANISMS AND ENTERIC BACTERIA IN WATER

J.D. WOMACK, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

The proposed work involves a study of Indicator organisms and enteric bacteria in three areas. The survival of Coliform bacteria and fecal Streptococci will be compared with other organisms found in the intestinal tract of man and in contaminated waters. Especial attention will be given to the enteric pathogens in the *Salmonella* group responsible for food intoxication. The effects of the Employment of a new secondary treatment plant by the city of Knoxville, Tennessee on the survival and persistence of indicator organisms in Fort Loudoun Lake will be investigated. Also to be examined in this project is the effect of Nitrogen nutrient levels on the growth and persistence of Fecal Streptococci in Lake water.

Field and laboratory studies will be conducted to measure the numbers of indicator organisms surviving in the lake. Time of flow will be determined with dye tracer techniques. Diffusion cell techniques will be employed to reveal the survival characteristics of enteric pathogens and naturally occurring pathogens will be investigated.

Data already in hand on the 'before' characteristics of Fort Loudoun Lake will be correlated with new information on Survival of indicator organisms after the new secondary plant is brought on the line. This data will be taken from samples taken from the lake on a time-of-flow basis using dye tracer techniques.

5. WATER QUALITY MANAGEMENT AND PROTECTION

The natural nitrogen nutrient level variations in a small lake will be related to the survival and growth of Fecal Streptococci. Laboratory studies under controlled conditions will also be performed.

5.1134, EFFECT OF INDUSTRIES OF MEMPHIS & SHELBY COUNTY ON PRIMARY PLANKTONIC PRODUCERS

E. DOODY, Christian Brothers College, Undergraduate School, Memphis, Tennessee 38104

The study aims to find characteristics of the principal waterways draining the area in and around Memphis, Tennessee, into the Mississippi River. Physical and biological features will be investigated in relation to present potential pollutants along the course of such drainages. Planktonic species will be studied in their role as primary producers in an ecosystem. The first stage of investigation will be the periodic collection, identification, and evaluation of organisms and the chemical composition of the waters in which they were found. The second stage will involve the isolation and clonal growth in vitro of key species. The third stage will determine the susceptibility of the clonal forms to the effluents from industrial plants or to suspected pollutants from these industries.

5.1136, TURBULENT DIFFUSION AND REAERATION IN NATURAL RIVERS

P.A. KRENKEL, Vanderbilt University, School of Engineering, Nashville, Tennessee 37203

With the cooperation of the TWA and the Corps of Engineering in regulating flow through selected impoundments, field scale measurements of reaeration will be made using oxygen deficient hypolimnion waters. At the same time, vertical, surface, lateral and longitudinal mixing coefficients will be measured using previously developed techniques. Tracer methodology for the determination of mixing parameters under non-study state and stratified flow conditions recently developed theoretical mathematical models will be tested utilizing frequency response techniques.

5.1137, CENTER FOR RESEARCH AND TRAINING IN HYDRAULIC AND HYDROLOGIC ASPECTS OF WATER POLLUTION CONTROL

P.A. KRENKEL, Vanderbilt University, School of Engineering, Nashville, Tennessee 37203

To formally establish a training and research center for the study of the hydraulic and Hydrologic Factors affecting water pollution control; to continue existing research endeavors in this area of study, and to instigate new investigations utilizing the Tennessee Valley Authority and the Corps of Engineers reservoirs as 'laboratories'; to establish an information retrieval center for the subject area that would be of world-wide value; to eventually construct a building solely for the purposes described herein; and to continue and expand the existing training program designed to produce engineers knowledgeable in hydraulics, hydrology, and water pollution control. The project will be coordinated by a joint committee, comprised of members of the Federal Water Pollution Control Administration and Vanderbilt University.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1138, NATIONAL SYMPOSIUM ON THERMAL POLLUTION

P.A. KRENKEL, Vanderbilt University, School of Engineering, Nashville, Tennessee 37203

A. Project Objectives: To illustrate the need for research in Thermal Pollution, to elucidate the problems involved and their magnitude, to satisfy the need for exchange and dissemination of information concerning the thermal pollution problems confronting industry, municipalities and regulatory agencies involved in water pollution control work and to present the present state of knowledge in this rapidly growing field.

B. Plan of Operation: Two symposia will be held; one in Portland, Oregon concerned with the biological and chemical aspects of thermal pollution; and the other at Vanderbilt University involving the engineering and economic aspects of thermal pollution. The meeting will be co-sponsored by Vanderbilt University and the Federal Water Pollution Control Administration and will utilize the most competent people available.

C. Need for Project: The United States has more than doubled its electrical power production every ten years since 1935 and the corresponding increasing quantity of heated water discharged to our receiving waters is expected to continue to more than proportionately increase. A definite need exists to increase public and technical awareness of the problems caused by thermal pollution and to stimulate research and adequate water quality management of water temperature.

D. Facilities Available: The staff and faculty of Vanderbilt University and the Federal Water Pollution Control Administration will cooperate in planning the conferences and making the necessary arrangements. In Portland, the Bonneville Power Administration Auditorium will be used for the meetings and the Sheraton Motor Inn for accommodations. The Nashville Meeting will utilize the facilities of Vanderbilt University.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1139, STATUS OF THERMAL POLLUTION AND RESEARCH NEEDS

F.L. PARKER, Vanderbilt University, School of Engineering, Nashville, Tennessee 37203

Specific Objectives: The specific objectives of this study are: 1. To compile an exhaustive bibliography on thermal pollution, including the effects of heat on chemical, biological and physical aspects of water quality, the effects of heat on waste assimilative capacity, alternative methods for the dissipation of excess heat from cooling waters, the hydrodynamics of heated water discharges, and the energy balance as related to the dissipation of heat from receiving waters. 2. After intensive review, to select the most meaningful and current references from the bibliography and subject these papers to critical review and summary. 3. To present a report derived from (2) which will contain the following items: a. Discussion of each topic in sufficient detail to give the reader insight into the current stage of development of that topic. b. Discussion of the major research needs in each problem area and an indication of the most fruitful approaches of these needs. c. Discussion of the existing and potential water quality problems due to heated discharges and their relationship to water pollution control requirements.

5.1140, DEWATERING AND DRYING OF SLUDGE ON POROUS MEDIA

K.B. SCHNELLE, Vanderbilt University, School of Engineering, Nashville, Tennessee 37203

The dewatering and drying of sewage sludge is most commonly carried out in porous supporting media such as sand over a soil in a drying bed. Dewatering takes place as the water in the sludge simultaneously filters down through the porous supporting media and evaporates from the surface of the bed into the atmosphere. As the dewatering takes place moisture gradients are

5. WATER QUALITY MANAGEMENT AND PROTECTION

established and in turn provide the driving force for the diffusion of the moisture to the surface of the bed and the subsequent further drying of the sludge. Sludge, being a porous colloidal substance, often biologically unstable even if digested, forms a highly compressible structural lattice of low tensile strength as it dries. This weak lattice structure results in a decrease in permeability as well as surface cracking as the material dries.

The proposed research evolves around the determination of moisture gradients and transport rates within the supporting media, the sludge, and the air-vapor boundary layer in the atmosphere. Gamma ray spectroscopy will be used to ascertain the changes in moisture without disturbing the flow system. These measurements will be used to establish the dewatering and drying rate of sludge under various climatic, operating and design conditions.

5.1141, DETERMINATION OF HOWELL-BUNGER VALVE AERATION EFFICIENCY

R.A. ELDER, U.S. Tennessee Valley Auth., Engineering Laboratory, Norris, Tennessee 37828

The purpose of this project is to determine the efficiency of Howell-Bunger valves for increasing the oxygen content of oxygen deficient waters discharged from reservoirs. To obtain this knowledge, the Howell-Bunger valves are tested at a site approximately 600 feet downstream from TVA's Nottely Dam powerhouse. Water is withdrawn from the turbine scroll case and flows through a 30-inch-diameter steel pipe to the test location. Tests to determine the aeration characteristics for two basic configurations have been completed, i.e. (1) a valve at the end of a pressure conduit discharging freely into the air, and (2) a valve at the end of a pressure conduit with the discharge contained by a structure. Tests on a third basic configuration, i.e., with a valve located in a discharge tunnel, will be performed during the summer of 1969.

The following report describes the results of the two basic configurations: 'Aeration Efficiency of Howell-Bunger Valves,' Laboratory Report No. 1, TVA Engineering Laboratory, Norris, Tennessee, July 1968.

5.1142, ENCAPSULATION AND SOLIDIFICATION OF INTERMEDIATE LEVEL RADIOACTIVE WASTES IN THERMOPLASTICS

R.E. BLANCO, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee

Development studies will determine the kinds and quantities of waste that can be incorporated in various thermoplastics, the levels of radioactivity that can be tolerated and the engineering variables involved in operation of a mixer-evaporator for production of the plastic product. Thermoplastics appear to be a marked improvement over encapsulation in asphalt particularly with respect to fire and explosion potential. The program will include laboratory hot cell and engineering development studies. Leach rate will also be determined for the final product.

5.1143, APPLICATION OF HYPERFILTRATION WITH DYNAMICALLY-FORMED MEMBRANES TO TREATMENT OF MUNICIPAL SEWAGE EFFLUENTS

K. KRAUS, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (14-12-423)

Oak Ridge National Laboratory will investigate the application of hyperfiltration with dynamically-formed membranes to the treatment of municipal sewage. Primary and secondary effluents will be included in the study, but with special emphasis on activated sludge effluent. An assessment of both organic and inorganic rejection will be made. Various membrane support materials of various pore sizes will be evaluated and the necessity of using filter aids (with the larger pore sizes) and film-forming additives will be examined. Diatomaceous earth, polyelectrolytes, and the hydrous oxides of iron (III) and aluminum (III) would be the first choices if such substances are needed. Salts such as nitrate,

ammonia, and phosphate will be monitored to investigate the question of specificity of salt rejection. The effects of pressure, temperature, and influent pH upon product quality and flux will be investigated. To extend the period of high flux, some studies of methods of preventing membrane-fouling via turbulence promoters or backwashing are also proposed.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1144, A STUDY OF HYDRODYNAMIC ASPECTS OF REVERSE OSMOSIS (HYPERFILTRATION)

D.G. THOMAS, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee

Objectives - The objectives of this study will be to undertake a detailed analysis of three different present day technology reverse osmosis plant designs (plate and frame, spiral and tubular) to identify: (a) Critical hydrodynamic factors and their relative contribution to the total product water cost. (b) Optimum turbulence promoter designs and cell configuration geometries that will improve reverse osmosis process efficiency and reduce product water costs. (c) An experimental evaluation of concentration polarization in an idealized plate and frame geometry. The work shall include the following: (1) An analysis of empty channel hydrodynamics. (2) An evaluation of present turbulence promoter performance in turbulence promoter design. (3) An estimation of potential benefit from future improvements in turbulence promoter design. (4) An economic evaluation to identify the region of economic usefulness of turbulence promoters. (d) Modifications to existing designs which will improve the operational characteristics of the present designs.

5.1145, NORTH FORK ALLUVIAL DECONTAMINATION PROJECT

A.P. HANCOCK, West Cen. Tex. Mun. Water Dst., Abilene, Texas 79604

This project will demonstrate the abatement of surface water pollution caused by oil production brine seepage from shallow groundwater aquifers. The demonstration will be carried out at a site west of Albany, Texas, in one of the most heavily drilled oil and gas areas in the U.S.

Groundwater will be intercepted before reaching the stream (North Fork) by a series of shallow wells. Once removed from the shallow zone, this brine-contaminated water will be injected into deep subsurface geological formations for permanent disposal. Continuation of this corrective action combined with improved pollution control measures and natural recharge of the groundwater should eventually return the area to natural conditions.

5.1148, LIMNOLOGICAL INVESTIGATIONS OF TEXAS IMPOUNDMENTS FOR WATER QUALITY MANAGEMENT PURPOSES

E.G. FRUH, Univ. of Texas, School of Engineering, *Austin, Texas* 78712

The seasonal change in water quality parameters such as dissolved oxygen, pH, precipitates, nutrients, and microorganisms will be measured in seven sub-tropical impoundments within a 150 mile reach of the Lower Colorado near Austin. Field surveys will be conducted below the impoundments to determine the effect of releases on the water quality of the downstream impoundment. The data will serve as a model for future river systems which have been transformed from a free-flowing river to a series of slack-water pools with intermittent river reaches.

In the last year of the project, major emphasis will be placed on determining what effect additions of different quality waters (through a diversion project or pollution) would have on the water quality of the impoundments. Various nutrient enrichment studies will be conducted under different temperature and light conditions. Carbon-14 bioassay techniques will be utilized to determine limiting nutrient concentrations. Similar tests will be conducted using additions of river waters most likely to be diverted to the Texas Colorado River Basin in any future state water plan.

5.1149, ENZYMATIC TECHNIQUE FOR DETECTION OF SURPLUS PHOSPHORUS UPTAKE BY ACTIVATED SLUDGE

E.G. FRUH, Univ. of Texas, School of Engineering, *Austin, Texas* 78712

A. Project Objectives - The overall goal of this proposal is to distinguish the various mechanisms of phosphorus removal (physiochemical sorption, chemical precipitation, and 'luxury biological uptake') occurring in activated sludge systems.

B. Plan of Operation - An alkaline phosphatase test will be investigated to detect 'luxury phosphorus uptake' by activated sludge. 'Luxury uptake' can be distinguished because the enzyme is inhibited by orthophosphate. The test will be conducted under various environmental conditions so that phosphorus sorption and precipitation can be controlled.

Need for Grant - To alleviate nutrient enrichment of aquatic environments, phosphorus must be removed from wastewater effluents. To do this by a modified activated sludge system, the mechanism of phosphorus removal must be known.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1150, PHYSIOCHEMICAL RESPONSES OF RIVERS TO NATURAL AND MANMADE ENVIRONMENTAL CHANGES

E.F. GLOYNA, Univ. of Texas, School of Engineering, *Austin, Texas* 78712

The proposed research plan involves various interaction studies using closed ecosystems and a 'Model River.' The Objective is to evaluate the transport mechanisms which are operative in the waterway. Specifically, it is desired to develop a better understanding of the cycling effects of nutrients and conservative materials under various environmental conditions and to incorporate these uptake, release, and cycling effects into the total transport model. To accomplish this it is necessary to develop better approximations of the physiochemical system of a fertile waterway.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Texas

5.1151, BACTERIAL EFFECTS OF ALGAE ON ENTERIC ORGANISMS

E.F. GLOYNA, Univ. of Texas, School of Engineering, *Austin, Texas* 78712

The research will demonstrate the effectiveness or selectivity of certain algal cultures in reducing the viable numbers of bacteria which are common to waste-waters of domestic origin. The information obtained will demonstrate the effectiveness of waste stabilization ponds and receiving streams in reducing the numbers of enteric bacteria when ponds and streams contain large populations of algae. Through this research it is hoped that a means can be found to estimate the die-off and aftergrowth rates of enteric bacteria where certain algal forms predominate. The growing use of various types of waste stabilization ponds throughout the USA and particularly the lesser developed countries provides a strong justification for support. The results of the proposed research, in conjunction with the current process design studies and the 'Effect of Toxic Organics on Waste Stabilization' (WP-00688-02, February 1, 1965 - January 31, 1968), will provide an important insight to design practices as based on disease transmission and its control.

5.1153, MIXING AND DISPERSION OF CONTAMINANTS IN RESERVOIRS

F.D. MASCH, Univ. of Texas, School of Engineering, *Austin, Texas* 78712

Field studies on the dispersion of a conservative tracer have been made in Lake Travis, Texas, a deep fresh water reservoir in which the predominant currents are generated by the wind. The purpose of the study was to examine the current velocity distribution with depth, the rate of dilution, and the dispersion coefficients for correlation with such parameters as the surface velocity and wave conditions. In all cases, time scales were limited to six hours and all tracer releases were made at the surface.

Results show that vertical and lateral diffusivities increase with the energy in the wave spectrum, but longitudinal diffusivity decreases. The dominant mechanism for dispersion appears to be the shear flow mixing resulting from the vertical distribution of velocity.

The peak concentration in a dispersing cloud was found to decrease with the -2.5 power of time. This rate appears to be independent of the ambient conditions and the geometric characteristics of the site.

5.1157, ELECTROPHORETIC CLARIFICATION OF WATER

E.A. HILER, Texas A & M University System, School of Agriculture, College Station, Texas 77843

This research involves a study of the utilization of the electrophoretic method for pollutant removal from natural waters. Electrophoretic clarification is effected by removal of charged colloidal particles from water as the suspension is passed through a dc electric field.

The purpose of this research is to investigate the removal of colloidal clay, bacterial and pesticidal pollutants from water by the electrophoretic method. The objectives are as follows: (1) development of an optimal electrode arrangement based on results of theoretical and basic experimental research; (2) characterization of various contaminants present in typical natural waters; and (3) evaluation of the efficiency of removal of these pollutants by the electrophoretic method.

This study will provide a critical evaluation of the feasibility of the electrophoretic method of water clarification.

5.1159, METAL ION-CATALYZED OXIDATION OF PHENOLS AND AROMATIC AMINES

A.E. MARTELL, Texas A & M University System, Graduate School, College Station, Texas 77843

The purpose of this investigation is to study the kinetics and mechanisms of the oxidation of phenols and aromatic amines by molecular oxygen in the presence of manganese salts, and of other metal salts, as catalysts. Such reactions are of interest because of the use of permanganate, and because of the presence of compounds of other metals, in the purification of water containing phenols and aromatic amines derived from industrial contamination. Understanding of the reactions by which these substances are oxidized to innocuous compounds is expected to lead to improvements in methods of water purification.

The oxidation of phenols and aromatic amines will be studied with various oxidation states of manganese, and with the higher oxidation states of other metal ions such as iron, cobalt, and vanadium, as oxidizing agents. Similar reactions with molecular oxygen, in which the metal compounds have catalytic functions, will also be studied. Oxygen insertion reactions of the oxyanions of the metals will be investigated with isotopic O-18 tracers. Special attention will be paid to oxygen-carrier systems in which the metal ions form complexes with molecular oxygen that are useful in the oxidation of organic compounds.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1160, THE INFLUENCE OF GRAZING MANAGEMENT SYSTEMS ON VEGETATION COMPOSITION AND LIVESTOCK REACTION

L.B. MERRILL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: (1) Determination of desirable rates of stocking of range pastures. (2) Determination of desirable combinations of animals for proper utilization of range pastures. (3) Determination of desirability of deferred rotation grazing as compared with continuous grazing. (4) Determination of reaction of range vegetation under various grazing uses.

Watershed studies in cooperation with ARS have shown great differences in water loss for pastures with different vegetative covers.

These results can be used by the action agencies to instigate soil and water conservation. The general public will be benefited in that the best systems of management also produce the greatest plant cover and will thus improve the vast natural watersheds and divert a maximum amount of rainfall to the underground water supply.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.1161, LABORATORY STUDIES OF TOXIC DINOFLAGELLATES

S.M. RAY, Texas A & M University System, Graduate School, College Station, Texas 77843

Shellfish oysters, clams, and mussels are being subjected to laboratory cultures of Gulf of Mexico dinoflagellates (*Gymnodinium breve* and *Gonyaulax monilata*) which are toxic to marine fishes, to determine if these shellfish will produce toxic symptoms when eaten by mammals and birds. We have induced shellfish poisoning in chicks by feeding them oysters which had been subjected to *G. breve* cultures. The influence of variable culture conditions and media on the relative toxicity of *G. breve* and *G. monilata* cultures, and the influence of such factors on the stability of the toxin(s) in shellfish will be investigated. Furthermore, factors that might influence the feeding activity of shellfish subjected to cultures of these dinoflagellates will be considered. Pharmacological and toxicological studies will be conducted to determine the nature and mode of action of the toxins produced by these two dinoflagellates. The purpose of the proposed work is to gather information that will permit the evaluation of the Gulf of Mexico dinoflagellates as potential etiological agents for paralytic shellfish poisoning. Basic information will be obtained on dinoflagellate-mollusc relationships, and thus contribute to our knowledge of ecology and physiology of these two groups of organisms. Other species of *Gonyaulax*: *G. acatenella*, *G. catenella*, *G. tamarensis*, *G. polyedra*, *G. polygramma*, *G. sphaeroidea*, *G. spinifera*, and *G. washingtonensis*, will also be studied. The proposed studies are a part of this laboratory's long-range research program in molluscan biology.

5.1162, GROWTH HABITS, SPREAD AND HERBICIDAL RESPONSES OF TRUMPET CREEPER

H.E. REA, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objective: To determine the effects of climatic and edaphic factors on movement, persistence, and toxicity of herbicides in soil.

Procedures: The effect of incorporation, irrigation, rainfall and soil type on the phytotoxicity, persistence and movement of 1, 1 dimethyl-3-(alpha, alpha)-trifluoro-m-tolyurea and (2,4 bis(isopropylamino)6-methylmercapto-s-triazine) will be determined. In field studies incorporation will vary from none to 4 inches deep prior to and at planting. Irrigation will vary from various amounts of sprinkling to flooding of flat and bedded land. Phytotoxicity will be determined under field conditions for cotton and crops that occur in common cropping sequences. Movement and degradation of herbicides in the soil will be determined by bioassay. Soil types will be clay, clay loam, loam, fine sandy loam and loamy sand. In conjunction with field studies, laboratory and greenhouse studies will be conducted to determine if the degree of soil moisture saturation affects herbicide toxicity. Studies will also be conducted to determine the effect of various amounts of simulated rainfall or irrigation on the leaching and persistence of the herbicide on the 5 soil types.

5.1163, THE DISPOSITION OF PESTICIDES IN THE SOIL

G.W. THOMAS, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Obj.: A. To determine the distribution of pesticides in selected soils and their drainage waters, using sites to which known amounts of pesticides have been applied. B. To determine the physical, chemical, and biological processes, and soil characteristics which are important in the disposition of pesticides in soils.

Description of work: Soils varying in physical, chemical and mineralogical properties will have pesticides of various types applied to them in laboratory columns. Movement of pesticides and movement of water will be compared. Prediction on the basis of pesticide and soil properties will be attempted.

Experimental plots in the field will be sampled to see how closely the behavior of pesticides predicted from laboratory experiments fits under field conditions.

5.1164, STORM WATER TREATMENT FACILITIES

C.H. WILLIAMS, Dallas Water Works, Dallas, Texas

The proposed treatment facility is to serve a twofold need in that it will 1.) provide service to the City of Dallas in treating an overflow mixture of domestic wastewater and infiltration storm water; and, 2.) it will demonstrate the effectiveness of a new and improved method (ie, chemical treatment and clarification of this wastewater source). The City of Dallas suffers an ailment typical of many cities in that the majority of the separate sanitary sewers are subject to high infiltration quantities during storms. Current building code and design and inspection practices will ease the problem of overflows in future systems; however the existing sewers will not benefit and the problem of overflows will persist. The proposed facility will demonstrate an effective means to control this pollution source. The design of the proposed facility will also be applicable for overflow treatment from combined sewer systems which will expand its benefits as a demonstration facility. 3.) Since the proposed storm water treatment plant is convenient to the lime softening filter plant waste chemicals, it will provide a test of the effectiveness of using these chemicals for removal of phosphates and chemical precipitation of sewage sludge.

The project was approved May 22, 1968 with 665 days for design and construction after which there will be twelve (12) months for operation.

5.1165, A COMPLETE RECYCLE WASTE WATER TREATMENT PLANT

C.H. WILLIAMS, Dallas Water Works, Dallas, Texas

Some trickling-filter plants produce effluents having a quality below proposed standards. Many of these plants discharge effluent into streams, composed only of wastewater. Dallas and the Trinity River is an example of this regional problem.

The first objective of this project is to determine the best process to produce an effluent having the quality required for discharge into a river which, generally, has a flow made up of treated wastewater only. The second objective is to recycle some of the renovated wastewater, treated to raw water standards, into the city raw water supply, thus reducing the required quantity of the city water supply. The plan is to add the activated sludge process to the existing trickling filter. Coagulation-sedimentation and filtration will follow the biological treatment.

5.1166, ION SELECTIVE ELECTROCHEMICAL SENSORS

I. TRACHTENBERG, Texas Instruments Incorporated, Dallas, Texas

In this proposed research program we plan to demonstrate the feasibility of making ion selective electrochemical sensors for use in the continuous monitoring of saline and brackish water. These sensors hopefully will be inexpensive, chemically durable and highly ion selective. The ions of particular interest are Ca^{2+} , Mg^{2+} , Fe^{2+} , Mn^{2+} , Na^{+} , K^{+} and SO_4^{2-} . Non-oxide glasses will be doped with varying concentrations of salts of the specific ion of interest or of salts which will selectively react with ions of interest. We plan also to study the homogeneity of the doping process as well as various electrode and membrane configurations. Activation of the various doped glasses will be carried out under a variety of controlled conditions. Finally we plan to evaluate the sensors' response to concentration changes and selectively to interference of other ions.

5.1167, RAPID IDENTIFICATION OF MICROBIAL POPULATIONS IN WATER

R.K. GUTHRIE, North Texas State University, Graduate School, Denton, Texas 72603

This project will test the feasibility of using fluorescent antibody-membrane filter techniques for rapid identification of microorganisms in water supplies. Bacteria isolated from fresh water, reservoirs and streams, will be isolated and identified by conventional methods. Following identification, species specific and genera specific antisera will be produced in rabbits and conjugated with fluorescent dyes. These fluorescent antisera will then be used on non-fluorescent membrane filters for efficiency of identification by the methods of Danielsson.

5.1168, A STUDY OF THE METABOLISM OF THE AQUATIC ACTINOMYCETES

J.K. SILVEY, North Texas State University, Graduate School, Denton, Texas 72603

The aquatic actinomycetes have been shown to comprise a diverse serological group when compared with the terrestrial Streptomyces. Serological grouping is based on antigen-antibody precipitation tests in normal diffusion agar plates.

The spore stages of the aquatic serological group germinate under anaerobic conditions, and the primary mycelia adapt themselves to that environment for development. The terrestrial groups according to serological classification require oxygen for spore germination and primary mycelial development.

Studies on the water-mud interface in the bottom of reservoirs demonstrated the rapid development of the aquatic Streptomyces but an absence of terrestrial species. Odor compounds produced by the aquatic group appeared to be chemically different from those produced by the terrestrial forms. These findings are based on ecology, gas chromatography, and analytical chemical techniques.

The aquatic actinomycetes may become closely associated with certain species of blue-green algae. Cultures of the algae continue to liberate actinomycetic tastes and odors. The mechanism of the association is being investigated with the electron scope, with gas chromatographic techniques, and with chemical analyses.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1169, NATURALLY OCCURRING TASTES AND ODORS IN WATER SUPPLIES

J.K. SILVEY, North Texas State University, Graduate School, Denton, Texas 72603

The taste and odor compounds produced by the aquatic actinomycetes may be satisfactorily concentrated by employing freeze-stir techniques. Samples produced by this method may result in approximately 2,000 times the original concentration for the organic components responsible for the tastes and odors. Low temperatures maintain the compounds in original chemical composition without altering the molecular structure. Gas chromatographic studies of the concentrates from laboratory-produced cultures indicate that six components are involved in the typical earthy, musty odors produced by these organisms. NMR investigations demonstrate that all compounds are neutral and polar. Studies on taste and odor components from the water supplies subjected to the same techniques demonstrate that the compounds available in raw water are chemically identical with those produced by laboratory techniques. With the above information available, the use of gas chromatography with the proper instrumentation now available to use the mass spectrometer should make identification of the compounds relatively assured.

5.1170, DISPERSAL OF VIABLE ALGAE AND PROTOZOA BY AQUATIC INSECTS

K.W. STEWART, North Texas State University, Graduate School, Denton, Texas 72603

Work on this proposed project is concerned primarily with determining the extent to which certain aquatic insects serve as passive transport vehicles for viable algae and protozoa. Aseptically collected insects are washed in sterile soil water extract or other desirable culture media. Washings are then cultured in a controlled environmental chamber and examined microscopically at one to two week intervals for detection of genera of algae and (or) protozoa. Similar cultures are made from contents of the fore, mid and hind guts of insects, dissected aseptically, to determine if algae and (or) protozoa can remain viable while passing through the alimentary tract.

Another phase of this study involves determination of the length of time commonly transported algae and protozoa can remain viable while attached or adhering to the external body of insects. This will be accomplished by artificially 'contaminating' sterile live specimens with pure cultures of algae and protozoa, and holding them with sterile clamps in a controlled environmental chamber. Interval washings of groups of specimens treated in this manner will yield the information desired.

5.1171, EFFECT OF ANTIBIOTICS ON FUNGUS PARASITES IN OYSTERS

S.M. RAY, Texas A & M University System, Marine Laboratory, Galveston, Texas

The main objective of the proposed research is to determine the efficiency of antibiotics and antibiotic-like synthetic compounds in controlling *Dermocystidium marinum*, an important fungus parasite of oysters. It is hoped that these studies will lead to a method for either inhibiting the development of or eliminating this disease-causing parasite from laboratory stocks of experimental oysters.

A secondary objective is to improve the culture method for detecting *D. marinum* in oyster tissue by using either more effective and/or less inhibitory antibacterial agents than those presently employed.

These studies should provide a better understanding of the life cycle of *D. marinum* and possibly provide additional basic information on fungal diseases in general.

5.1173, STEROLS AND LIPIDS IN WATER POLLUTION

L.L. SMITH, Univ. of Texas, School of Medicine, Galveston, Texas

The presently proposed work considers the examination of natural waters for their lipid content, particularly their sterol content (including cholesterol and the fecal sterol coprosterol). It is hoped that a full knowledge of the sterol content of natural waters will permit the use of such analyses for sterols for recognition of pollution from domestic sewage, animal and plant wastes, etc. as these might be encountered in natural water supplies. Both animal and plant material contains sterols, and by detecting a given key sterol in excess in a water sample it should prove possible to identify the probable origin of the sterol. Furthermore,

5. WATER QUALITY MANAGEMENT AND PROTECTION

knowledge of the sterol content should offer a fundamental basis for our improved understanding of the means by which lipids and sterols are disposed of in natural waters. Water samples have been taken from open surf, quiet bay, running tidal, and domestic sewage treatment effluents and the sterols therein analyzed by chromatographic means. In open uncontaminated waters certain phytosterols have been found but no evidences of domestic sewage contamination were obtained. Domestic sewage does contain cholesterol and coprosterol, even in fully treated sewage. The fate of these sterols as they are diluted in water sources is under study.

5.1180, ALTERNATE METHODS OF MOSQUITO CONTROL TO REDUCE CHEMICAL POLLUTION OF WATERS FOR RECHARGE OF THE OGALALLA FORMATION

E.W. HUDDLESTON, Texas Technological College, School of Agriculture, *Lubbock, Texas* 79409

The proposed research plan involves evaluation of alternate methods of mosquito control which will reduce the amount of organic pesticides applied to surface waters. The main objective is to evaluate the effects of mechanical and chemical weed control methods on oviposition, hatching, and larval development of those mosquitoes that breed in playa lakes.

Techniques will be developed to subdivide a playa lake bed into small experimental units permitting replication and statistical evaluation of data. Information gained from small replicated plots will be used to design a practical, low-cost method of reducing mosquito populations to a level at which the amount of insecticides used in this region will be greatly reduced; thus, reducing the chemical pollution of waters used to recharge the aquifer, the Ogallala formation.

5.1182, EFFECTS OF RIVERS ON THE METABOLISM OF TEXAS BAYS

B.J. COPELAND, Univ. of Texas, Graduate School, *Port Aransas, Texas* 78373

The overall objective of the research proposal is to seek ways to distinguish the degree to which a body of water is polluted, ascertain the contribution of rivers to the bay, and to discover quantitative and qualitative differences between polluted and unpolluted coastal waters. Comparisons of concentrations of various nutrient compounds to primary productivity and various animal and plant assemblages will be made and the river's contribution to the bay will be evaluated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1183, STABLE CARBON AND OXYGEN ISOTOPE RATIO VARIATIONS IN THE FLOW TO CARBON AND OXYGEN THROUGH NORMAL AND POLLUTED AQUATIC SYSTEMS

P.L. PARKER, Univ. of Texas, Graduate School, *Port Aransas, Texas* 78373

The main goal of the proposed research is to develop ways to use measured variations in stable carbon and oxygen isotope ratios to solve problems concerning the flow of these elements in aquatic systems. By investigating both normal and polluted systems a better understanding of both will result. Rivers, lakes and marine bays are aquatic systems which would be studied. However, single species of organisms, sewage systems and industrial plants also have a flow of carbon and oxygen and would be suitable for study.

In addition to the stable isotope studies the total amount of dissolved and particulate organic matter in area waters will be investigated. The organic geochemical studies which have been conducted here for the past three years will be continued.

5.1185, METHODS TO REDUCE WATER POLLUTION CAUSED BY STORM WATER SEWER LOADING BY USING FLUID FLOW FRICTION REDUCERS

H.R. CRAWFORD, Western Company, Richardson, Texas 75080

The research plan involves laboratory and field investigations directed at the use of high molecular weight polymers added to sanitary sewage with infiltrated ground water to demonstrate feasibility of reducing pipe friction loss with resulting increase in sewer flow rates.

Laboratory investigations shall consist of the following: 1. Small scale experiments on a water-polymer system to characterize friction reducing capabilities, storage life, toxicity, and effect as a coagulant. 2. Experiments to classify domestic sewage from chemical and physical properties. Field investigations shall consist of the following: 1. Testing on small scale models of a partial sewer system the friction reducing capability of selected polymers at varying sewage pipe depth and including surcharge. 2. Development of an injection device and method of injection of the polymer into the sewer pipe. 3. Determine the best location for injecting polymer into sewer pipe.

Laboratory and field data would be correlated for application in a full scale test of polymers added in a sanitary sewer infiltrated with ground water and in a waste water treatment plant.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1186, DEVELOPMENT AND DEMONSTRATION OF MATERIALS TO REDUCE OR ELIMINATE WATER INFILTRATION INTO SEWERAGE

H.R. CRAWFORD, Western Company, Richardson, Texas 75080

The research plan involves laboratory and large-scale investigations directed at the development of a chemical sealant to prevent ground water infiltrations into sanitary sewers and its feasibility in application.

Laboratory investigations shall consist of the following: 1. Small scale experiments to determine the most promising sealant formulations according to the following properties: a. Bonding ability b. Strength c. Variable cure time d. Ease of handling e. Stability f. Cost 2. The following parameters will be utilized in evaluating the sealant formulations: a. Tensile strength through the bond between cured sealant and the conduit. b. Flexural strength of cured sealant material. c. Environmental tests of cured sealant material.

The large-scale investigation shall consist of further screening of sealant formulations in a sewer line mock-up with a controlled environment. This will include an investigation and evaluation of existing equipment to apply the new sealant.

At the conclusion of the program recommendations will be made for a chemical sealant to prevent ground water infiltration and needed improvement and/or development for application of the sealant.

5.1187, MULTILAYER FILTRATION

K.J. IVES, Univ. College, London, United Kingdom

The theory of the filtration of water or wastewater through deep granular beds indicates that an improvement in design can be obtained if the size of the granular media decreases in the

direction of flow. This has been demonstrated experimentally for particulate suspension in water by filtering in an upflow direction through size-graded sand, or by downflow through three layers of coarse anthracite, medium size sand and fine garnet. The three-layer design is to be tested for the filtration of flocculent metal hydroxide suspensions, and compared with normal sand bed filtration. Various arrangements of grain sizes and layer thickness will be tried to determine an optimum design. This aspect will also be explored theoretically. Other media (e.g. magnetite, glass beads, crushed flint, plastics) will be examined to see if they are of any practical use, and to see if the three-layer concept can be extended to several layers.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1188, EUTROPHICATION OF SHELTERED BAYS IN A LARGE LAKE

W.T. HELM, Utah State University, Graduate School, Logan, Utah 84321

Bear Lake at the present time is a clear oligotrophic lake. With the recent increase in recreational use of the area, however, a number of boat harbors and breakwaters have been constructed. These structures have interrupted the normal shoreline currents. Along unprotected shores, the currents scour the bottom, limiting the amount and diversity of rooted vegetation and bottom organisms. Modification of this habitat by creating relatively quiet pockets protected from the wind driven water currents has encouraged the growth of a wide variety of organisms. The non-turbulent circulation pattern in these areas insures the retention of at least part of any intruding nutrient-rich water. The reactions of the rooted vegetation, phytoplankton, zooplankton, and possibly fish to this altered environment will logically provide a preview of the changes to be expected throughout the lake if overall nutrient levels are allowed to increase.

The study will be initiated by locating a series of comparable bays. The water chemistry of these bays will be compared with each other and with the lake water. Complete records of chemical and physical conditions during the study will be kept. Biological sampling will determine the abundance and speciation of periphyton, plankton, bottom organisms, and rooted aquatic plants. Samples from the open lake and from non-enriched bays will be compared to those from enriched bays to determine changes caused by enrichment. In this fashion, both quantitative and qualitative changes can be measured and evaluated. This project was started in fiscal year 1968 and will continue through year 1970.

5.1189, SEQUENTIAL USE WITHIN A HYDROLOGIC COMPLEX

D.W. HENDRICKS, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

The project objective is to demonstrate the feasibility of developing and utilizing a unified hydrologic-quality simulation model, as a tool for the quality-quantity management of a hydrologic unit. The model development must be sufficiently general in approach that it may be adapted to other hydrologic entities. It is not only the model concept and approach per se that is of interest, but also delineation of necessary and sufficient inputs to make the model work. Such inputs include: (1) what amount of data is needed, in time and space, (2) how such data are utilized, and (3) what submodels are feasible (i.e., Streeter Phelps, statistical correlations, etc.). To a degree these inputs need to be delineated in the context of the specific purpose of the model, which is not to be ignored in the philosophy of development.

5.1190, BACTERIAL ADSORPTION ON SOILS

D.W. HENDRICKS, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

5. WATER QUALITY MANAGEMENT AND PROTECTION

This work will focus upon the role of adsorption, as a mechanism in bacterial retention, in the flow of bacterial suspensions through soils. The project intends to be definitive in that all of the hypothesized factors that affect bacterial adsorption will be investigated. These factors include cell concentration, temperature, chemical environment, and surface activity. By understanding and quantifying the fundamental removal mechanisms, predictions of bacterial movement through soils can be made. Other mechanisms of retention which will be investigated, but in a less exhaustive treatment, include sieving, gravitational sedimentation, and several other possibilities.

Such knowledge will allow rational assessments of the health hazards of groundwater recharge, shallow aquifer contamination, and proximity of septic tanks to wells.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Utah State University

5.1191, SORPTION KINETICS IN FLOW THROUGH GRANULAR PARTICLES

D.W. HENDRICKS, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

This project proposes to focus specifically on delineating the sorption kinetics for a mobile dissolved chemical species interacting with a fixed phase, consisting of granular sorbent particles. The stress will be upon obtaining a generalized phenomenological description of the sorption kinetics--described in terms local solid and liquid phase sorbate concentrations, and which will reflect in the form of the rate law, the effects of temperature, competition for sorption sites by other species, nature of sorption site, and the nature of the rate limiting step in the reaction (i.e. solid or liquid phase diffusion). The results must be operational in terms of obtaining a solution for concentration profiles of sorbent in liquid and solid phases and the procedure for application must be based upon a limited amount of laboratory work--to be obtainable on a routine basis.

With the delineation on an operational basis of the above factors and methodology for describing sorption kinetics, one should be able to rationally assess concentration profiles in the liquid and solid phases. This should have application: (1) to investigative assessments and management of ground water contamination problems and (2) in optimizing the design and operation of ion-exchange and adsorption columns. The latter, of course, is becoming increasingly important as a step in tertiary treatment.

5.1192, EFFECTS OF WATER TEMPERATURE UPON RESPIRATORY METABOLISM OF CUTTHROAT TROUT, SALMO CLARKI

R.H. KRAMER, Utah State University, State Coop. Wildlife Res. Unit, Logan, Utah 84321

This study is part of a long-range program at the Utah Cooperative Fishery Unit to determine water temperature requirements for respiratory metabolism of Utah fishes. The objectives of the present study are to describe standard metabolism, active metabolism, and scope for activity (all in terms of oxygen consumption rate) for cutthroat trout at 5, 10, 15, 20, and 25 C. The respirometer to determine active metabolic rate is a propeller-driven apparatus patterned after that used by Smit (1965, Can. J. Zool. 93: 623-633). The standard respirometer employs a heat-loss flowmeter like that used by Beamish and Mookherjee (1964, Can. J. Zool. 42:161-175) to obtain an index to spontaneous activity of the fish while in the respirometer. This index is plotted against simultaneous measurements of oxygen consumption and the regression line extrapolated to zero activity to obtain an estimated rate of standard metabolism. Scope for activity is the arithmetic difference between the active and standard rates.

5.1193, THE EFFECTIVENESS OF WATERFOWL IN CARRYING PATHOGENIC MICRO-ORGANISMS

J.B. LOW, Utah State University, State Coop. Wildlife Res. Unit, Logan, Utah 84321

Waterfowl because of their migratory habits fly from one water source to another in their early or seasonal movements. These birds are potential carriers of disease producing micro-organisms because of the common practice of Utah towns and cities of disposing of their sewage into streams of water. These streams usually drain into lakes or marsh lands which are utilized by the waterfowl for nesting, brood rearing, and other normal activities. There is a large accumulation of organic sewage in these areas and may be a source of pathogenic organisms. Because waterfowl are in contact with this raw sewage they will be investigated as to the role they may play in the dissemination of micro-organisms.

The work will be carried out under the following objectives: (1) To determine the incidence of indicators of pathogenic micro-organisms present on waterfowl in western marshlands. (2) To study the effectiveness of waterfowl to directly discriminate organisms by carrying them on feet, feathers, and other body parts. (3) To determine the organisms available for transmission by waterfowl. (4) To determine the longevity of contamination of waterfowl by micro-organisms attached to feet, feathers and other parts of waterfowl.

SUPPORTED BY Utah State University

5.1194, FACTORS LIMITING WATERFOWL PRODUCTION ON THE SPRING-FED SALT MARSHES WEST OF THE GREAT SALT LAKE

D. MCKNIGHT, Utah State University, State Coop. Wildlife Res. Unit, Logan, Utah 84321

Current waterfowl productivity will be ascertained for a typical spring-fed salt marsh and compared both quantitatively and qualitatively to available data from the Bear River Refuge on the hypothesis that a difference in waterfowl productivity exists between the two areas.

Disease and nutrition factors which alone or in combination might cause excessive brood mortality or cause lowered reproductive success through decreased vigor will be examined on the spring-fed marsh. Analyses of food plants and invertebrates to determine availability, nutritional content, and levels of trace elements will be accomplished on the study area. Ducklings and adult ducks will be collected in the salt marsh and examined for abnormalities, and gullet-gizzard contents will be studied to determine food habits in this area. Periodic examinations will be made of the marshes to find sick or abnormally developing young ducks and geese. A sample of young mallard ducklings of various ages will be inoculated with varying doses of several endemic arboviruses in the laboratory to determine if these viruses can be lethal to ducklings. Serum samples from adult and young ducks from these marshes will be assayed to determine the incidence of natural exposure to arboviruses.

SUPPORTED BY Utah State University

5.1195, A STUDY OF THE BIOLOGICAL, CHEMICAL AND PHYSICAL NATURE OF WATER QUALITY FACTORS UNDER UTAH CONDITIONS

J.M. NEUHOLD, Utah State University, Utah Ctr. For Water Resour., Logan, Utah 84321

The characteristics and relationships of water quality factors pertinent to short, snow-fed mountain streams feeding to desert floors will be studied. Consideration will be given to: 1) watershed contamination 2) irrigation return and 3) domestic and industrial pollution. The relationship of the contaminant to volume of flow, rate of degradation and subsequent incorporation into the aquatic biomass will be the matter of primary concern. Contaminant cycling, sedimentation and physical change will also be studied. The system under study will lend itself to model construction in terms of the environmental, physical, chemical and biological effects on contaminants. The information for such a model will be obtained

5. WATER QUALITY MANAGEMENT AND PROTECTION

from field observations and from experiments conducted on excised portions of the environment.

Utah State University

5.1198, MINERAL RECOVERY FROM CONCENTRATED BRINES

J.M. GLASSETT, Brigham Young University, School of Engineering, Provo, Utah 84601

The separation and recovery of the principal inorganic salts from a simulated sea water brine, based on Great Salt Lake water, and from sea water brine will be investigated. In particular, a study will be made of a phase rule process for the separation of pure salts from the brines by two cooling steps alternated with two evaporation steps. Optimum conditions for the separation and recovery of minerals will be determined. Salts to be recovered are: sodium chloride, sodium sulfate, potassium chloride, and magnesium chloride. Particular emphasis will be placed upon the recovery of magnesium chloride and potassium chloride since these salts have greater commercial value than the sodium salts.

A goal of this research project is to define an economical mineral recovery process which may lower the cost of saline water conversion to fresh water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

5.1199, POLLUTION AS A RESULT OF FISH CULTURAL ACTIVITIES

R.N. HINSHAW, State Div. of Fish & Game, Salt Lake City, Utah 84116

Fish hatchery effluents have not been evaluated as a source of pollution. However, with the large numbers of hatcheries in the Nation, this problem should not be overlooked any longer.

Three types of pollution are implicated in the waters contaminated by the effluent from fish hatcheries. The first of these are pathogens and parasites which effect is increased because of crowding in hatchery situations. A second category includes chemicals and drugs used for prophylactic and therapeutic treatment of fish. A third section, with which this research is concerned, is that pollution caused by wastes from fish metabolic processes, and unutilized feeds as well as algae and detritus from pond and raceway cleaning.

The research proposed for this study will be confined to that pollution represented by the third category. It is proposed to sample and examine those parameters that will best determine the levels, periodicity and the effects that these pollutants might have on the receiving waters and those organisms living in the affected waters. This is the first step of many in assessing the pollution contributed by fish cultural activities and leading eventually to the total clean-up of said pollution.

5.1200, CHEMICAL QUALITY OF BRINES ASSOCIATED WITH DEEP SEDIMENTS BENEATH GREAT SALT LAKE

W.P. HEWITT, Univ. of Utah, State Geolog. & Min. Surv., Salt Lake City, Utah 84112

Brine samples from a few judiciously placed deep holes, drilled to a depth of possibly 700 feet beneath the bottom of the Lake, are to be analyzed for their chemical quality. The object of this study is two-fold: first, to attempt to determine whether deep brines exist; second, to learn whether the heavy brines of the Lake proper are slowly sinking in the form of an inverted bubble.

SUPPORTED BY Utah State Government

5.1201, SALT DISTRIBUTION ALONG LAKE BOTTOM AND WITHIN DEEP SEDIMENTS BENEATH GREAT SALT LAKE

W.P. HEWITT, Univ. of Utah, State Geolog. & Min. Surv., Salt Lake City, Utah 84112

Measurements are to be obtained of the areal extent and depth of the sodium chloride that is being deposited on the Lake's bottom. By means of a Sparker Survey it is hoped to outline buried beds of Glauber's salt that have been precipitated from Lake Bonneville during the Quaternary. This program will be undertaken, in whole or in part, during the fiscal year that starts July 1, 1965.

Status: Work to commence on thickness of sodium chloride in northern arm of Lake in mid August 1966. Sparker survey work deferred to 1969.

SUPPORTED BY Utah State Government

5.1202, MICROBIAL ECOLOGY OF LAKE CHAMPLAIN AS INFLUENCED BY PESTICIDES

D.B. JOHNSTONE, Univ. of Vermont, Agricultural Experiment Sta., Burlington, Vermont 05401

Project Objectives: 1. To obtain an ecological evaluation of the various types of microorganisms present in the waters of Lake Champlain. 2. To determine the influence of microorganisms on pesticides in an aquatic environment. 3. To determine the influence of pesticides on the number and distribution of microorganisms in an aquatic environment. Description of Work Proposed: The aquatic microbial ecology in areas adjacent to the Vermont shoreline and relatively free of agricultural chemicals will be examined by standard microbiological procedures for culturing and enumerating microorganisms in natural environments. This will be correlated with basic limnological data such as dissolved oxygen, temperature, etc. obtained by other investigators who will employ the same sampling stations. Special emphasis will be placed upon those groups of bacteria that are active in organic matter decomposition such as nitrogen transformations. This laboratory has been active in studies with nitrogen transforming bacteria (3,5,6,7,8).

SUPPORTED BY U.S. Dept. of Agriculture
Vermont State Government

5.1203, LIMNOLOGICAL STUDIES OF LAKE CHAMPLAIN

M. POTASH, Univ. of Vermont, Agricultural Experiment Sta., Burlington, Vermont 05401

Objectives: To carry out field studies on Lake Champlain to determine as far as possible, its physical, chemical, and biological characteristics; and to continue long-term studies to determine whether these characteristics are being altered in any harmful way, or in any region of the lake, by the addition of pollutants.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Procedure: Present studies of three bays will be enlarged to encompass the entire lake, although emphasis will be concentrated on the eastern or Vermont shore. An additional 16-foot boat is requested to permit greater lake coverage. Transects of the lake will be established at approximately 5-mile intervals along the 112 miles length of the lake. Individual stations will be established at quarter-mile intervals along each transect, with physical and chemical measurements being made at standard depth intervals for each station.

Temperature measurements will be made with an electronic thermometer in shallow waters, and with a bathythermograph at deeper stations. Light transparency will be measured with a Secchi disc through the use of drogues with current drags lowered to standard depths.

Vermont State Government

5.1204, ECONOMIC ANALYSIS OF RESOURCE POLLUTION BY PESTICIDES AND OTHER WASTE MATERIALS

J. BINIEK, U.S. Dept. of Agriculture, Arlington, Virginia

Objectives: To develop economic information and techniques of analysis to determine optimum compromises between production efficiency and adverse monetary and non-monetary effects, which arise from deterioration of the quality of resources.

Approach: Formal and informal cooperative relations are established with other research and action agencies to the exchange of information and data. Multidisciplinary research and information is reviewed and analyzed to determine the severity of specific pollution problems. Conceptual and qualitative studies are undertaken to improve analytical techniques for appraisal of adverse impact situations. Alternative pollution control systems are analyzed with the intent of selecting an optimum control system for policy decisions.

SUPPORTED BY U.S. Dept. of Agriculture

5.1205, THE BEHAVIOR AND FATE OF DDT AND ZEC-TRAN IN A FOREST SOIL

E.G. DUNFORD, U.S. Dept. of Agriculture, Forest Service, Arlington, Virginia 22209

Object: To determine the movement, chemical change and resulting distribution pattern of DDT and Zectran applied to Douglas fir soils and the effects of environment, land and forest treatments on such reactions.

Plan of Work: During the first 2 years of the 3-year project, the investigators will concentrate on field observations, (1) measuring the relationships between the insecticides and the forest soil and environment, and (2) determining the effect of various land and forest treatments on the behavior of the two insecticides. All work, including analysis and interpretation, will be completed the third year.

SUPPORTED BY U.S. Dept. of Agriculture

5.1206, AN EVALUATION OF THE INSECTICIDE SEVIN AS A WATERSHED POLLUTANT

E.G. DUNFORD, U.S. Dept. of Agriculture, Forest Service, Arlington, Virginia 22209

Object: To provide information upon which to judge the potential of 'Sevin' as an environmental pollutant in forested areas.

Plan of Work: A study area has been established on the Shackham Brook Watershed in central New York. It encompasses a 'treatment' and 'control' subwatershed. The treatment area will receive an aerial application of Sevin; then samples of soil, water, and aquatic insects will be taken at frequent intervals to be tested for the presence and concentration of Sevin residues. Results will be evaluated.

SUPPORTED BY U.S. Dept. of Agriculture

5.1207, THE EFFECT OF DETERGENTS ON THE OXYGENATION OF WATER

J.A. CASKEY, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

Although many studies have been made showing that surfactants can lower oxygenation rates the mechanism by which this occurs is not known. The purpose of this investigation is to study what part of the surfactant molecule is responsible for this interfacial resistance to oxygenation. To this end the effect of following parameters on the interfacial resistance will be studied: hydrophobic chain length, hydrophilic functional group, surface orientation and counter ion effect. Pure surfactants will be used so that the resistance can be related to the surface concentration by means of Gibbs' adsorption isotherm.

A quiescent liquid manometric gas absorption contactor will be used for the study. From this investigation it is hoped that it will be possible to specify what type of detergent is needed to increase the capacity of existing activated sludge units in municipal waste treatment facilities.

Virginia Polytechnic Institute

5.1208, THE DISPOSITION OF PESTICIDES IN THE SOIL

T.B. HUTCHESON, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

Objectives: (a) To determine the distribution of pesticides in selected soils and their drainage waters, using sites to which known amounts of pesticides have been applied. (b) To determine the physical, chemical, and biological processes, and soil characteristics which are important in the disposition of pesticides in soils.

Description of work: Field plots will be located to which known amounts of heptachlor have been added representing a wide range of soil physical, chemical, and mineralogical properties. 'Matching' soil sites will also be selected which have known histories of no heptachlor application. Soils from these pair sites will be brought into the laboratory and greenhouse where persistence, degradation rate, and the movement of heptachlor and subsequent contamination of crop plants will be correlated with basic soil properties. Physical and chemical mechanisms affecting sorption, degradation and persistence of heptachlor and diazinon and the resulting contamination of crop plants, soils and agricultural waters will be studied by correlation of basic soil properties with reaction rates and plant uptake following application of these chemicals to soils under greenhouse and/or field conditions.

5.1209, REMOVAL OF TRACE ORGANICS FROM WATER BY ADSORPTION ON COAL

P.H. KING, Virginia Polytechnic Institute, School of Engineering, Blacksburg, Virginia 24061

The proposed research involves laboratory investigations to determine the extent of adsorption of trace quantities of biochemically resistant organic materials on coal. Specific methods to be employed include both batch and fluidized column studies utilizing a variety of selected solutes with a wide range of physical and chemical properties. Data obtained will be analyzed to show the kinetics of the adsorption process. The distribution of organic material between the aqueous phase and the adsorbed portion will be described if possible by an appropriate adsorption isotherm. The extent of adsorption on coal will be compared with similar data for activated carbon.

5.1210, A COMPUTER PROGRAM FOR FORECASTING POLLUTION AND DISSOLVED OXYGEN IN STREAMS

R.G. KRUTCHKOFF, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

In a recent research project 'A Stochastic Model for Pollution and Dissolved Oxygen in Streams', the principal investigator wrote a computer program which could predict the probability distribution of pollution and dissolved oxygen in streams as a function of the initial pollution and the stream parameters. This program suffers from two inadequacies which makes its use limited in practice. 1. It does not allow for changes in stream parameters

5. WATER QUALITY MANAGEMENT AND PROTECTION

along the stretch due to differences in stream beds, stream widths or a stream junction. 2. It does not permit the inclusion of more than one major source of pollution.

The inadequacies can be eliminated. The theory worked out for the original project should be sufficient to allow the changes necessary to eliminate the inadequacies of the program. The principal investigator and one graduate student will rederive the original program including these new features.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

5.1211, A STOCHASTIC MODEL FOR POLLUTION IN ESTUARIES

R.G. KRUTCHKOFF, Virginia Polytechnic Institute, Research Division, Blacksburg, Virginia 24061

The purpose of this investigation is to find a stochastic model for pollution and dissolved oxygen in estuaries. With this model it will be possible to predict the proportion of time that pollution will be above any given concentration or that dissolved oxygen will be below any given level. It is hoped that this information will result in better management of water resource systems and aid in forming more realistic restrictions on the use of estuaries for disposal of pollutants.

5.1212, TREATMENT OF DYEING BATH WASTE STREAMS BY FOAMING AND FLOTATION TECHNIQUE

D.L. MICHELSEN, Virginia Polytechnic Institute, School of Engineering, Blacksburg, Virginia 24061

The treatment of waste streams from dyeing operations is a problem in industrial waste treatment centering in the southeastern states. The proposed research plan will be the study of waste treatment and color removal of dispersed dye bath waste streams using foaming techniques. The initial stream to be studied will be a synthetic black or blue-black dispersed dye formulation including carrier approximating waste stream conditions from the dyeing of polyesters (Dacron) and triacetate rayon. The object of the work will be to study the removal of color, carrier (solvent), and perhaps dispersant surfactant using foam fractionation, adsorptive bubble fractionation and homogeneous ion flotation (complexing). Various parameters will be studied.

Depending on the outcome, the treatment of waste streams from other types of dyeing procedures may be tested using foaming techniques.

Some exploratory work on the removal of dissolved phenol and phenol derivatives from water may also be explored. This problem is pertinent to waste treatment because of toxicity and fish taste.

5.1213, MICROBIAL RELEASE OF SOLUBLE PHOSPHATE IN AN ACTIVATED SLUDGE ENVIRONMENT

C.W. RANDALL, Virginia Polytechnic Institute, School of Engineering, Blacksburg, Virginia 24061

The proposed research plan involves laboratory investigation directed at evaluating the factors which affect the microbial release of phosphate back to solution after uptake by an activated sludge system has occurred. The primary approach is to evaluate the effect of activated sludge process operational parameters such as dissolved oxygen and ORP levels, rate and duration of aeration, loading conditions, duration of anaerobiosis, etc., on release of soluble phosphate from the activated sludge microorganisms. A second area of investigation is the ability of various chemicals to stimulate or inhibit activated sludge phosphate release.

Parameter evaluation would employ the following methods. 1. Small scale batch-type experiments to study the effect of the various operational parameters individually. 2. Continuous flow experiments to further study the parameters and their combined effect, and to determine the feasibility of process modification.

Investigation of chemical effects will employ the following methods. 1. Batch-type experiments of individual chemical ef-

fects. 2. Warburg respirometer studies to determine lasting effects of chemical addition on sludge performance.

Data will be correlated for clarification of the basic mechanisms of soluble phosphate release from activated sludge microorganisms.

5.1214, CW-BW WATER DECONTAMINATION SET

R.J. GAINEY, U.S. Army, Engineer Research & Dev. Labs., Fort Belvoir, Virginia 22060

Objective: Technical Objective: Develop a method of destroying and/or removing chemical and biological agents in water to make it suitable for drinking purposes. Equipment and methods should be compatible with existing standard 600, 1500, and 3000 GPH field water purification units and utilize only items of equipment currently standard in military supply systems.

Approach: Conduct laboratory and field studies jointly with the chemical research and development laboratories relative to developing an effective procedure for decontaminating water containing chemical and biological agents.

Progress- Aug 66 Mar 68: A CW-BW water decontamination procedure was developed for removing these agents from water, as pretreatment with standard U.S. Army Erdlator-type water purification units. The procedure consists of a superhypo-chlorination to 100 PPM available chlorine followed by treatment with 600 PPM activated carbon. The procedure is used prior to, and in series with, the standard Erdlator units. The procedure completed ET/ST by TECOM and proved satisfactory in destroying GA, GB and BZ in water but failed under all conditions to meet the low drinking water levels of established MPCs for VX, L and HN-1. A check test is planned during the summer of calendar year 1968 to resolve the difficulties. Mixed agents will be used and also nerve gas GD, untried to date.

SUPPORTED BY U.S. Dept. of Defense - Army

5.1215, ION EXCHANGE UNIT, 3000 GPH

R.J. GAINEY, U.S. Army, Mobility Eqp. Res. & Dev. Ctr., Fort Belvoir, Virginia 22060

Technical Objective: This development will make available equipment for removal of dissolved radionuclides and other deleterious substances from water. Currently, there is no equipment available for removing soluble radioactive contaminants from water other than distillation, which is comparatively expensive. A secondary use will be to reduce the mineral content of some brackish water for drinking purposes or otherwise produce a high quality demineralized water supply.

Approach: After study of all available methods for removal of dissolved radionuclides from water, develop equipment with satisfactory military characteristics.

Progress: A truck mounted ion exchange unit was developed which had satisfactory operating characteristics but did not meet the transportability requirement. A transportable shelter mounted unit has been designed and a contract is being negotiated for a prototype test model.

SUPPORTED BY U.S. Dept. of Defense - Army

5.1216, SEEDING OF BRACKISH WATER

J.E. JONES, U.S. Army, Mobility Eqp. Res. & Dev. Ctr., Fort Belvoir, Virginia 22060

Technical Objective - An investigation to determine the techniques and processes feasible for the treatment of brackish waters having a high calcium sulfate content. No equipment is presently available for troop use which can be used to treat these waters. Sea water distillation equipment will become inoperative in a short period of time on such waters because of heavy deposits of sulfate scale in the evaporator.

Approach - The evaluation and the proving of factors found to be essential in the use of sulfate crystal nucleation technique to prevent calcium sulfate scale in evaporators of distillation equipment will be accomplished. Investigations and tests will be conducted to gain fundamental information relative to the behavior of calcium sulfate seed crystals in the applicable environments.

5. WATER QUALITY MANAGEMENT AND PROTECTION

Progress - Jul 67 Jun 68. During the report period investigations were made into the configuration of thickening devices for the concentration and classification of the seed crystals for reuse and the probability of ingestion of steam bubbles into the recirculation pump. The present forced circulation horizontal tube test evaporator was evaluated for entrainment of steam bubbles into the suction of the recirculation pump. Steam bubbles that become ingested by the pump could cause erosion and premature pump failure. The evaporator was fitted with strategically located sight glasses and operated over its entire flow range to over eight feet per second under heating conditions. No bubbles could be seen ingested into the pump. A 200 GPH film spray horizontal tube evaporator belonging to the Office of Saline Water is to be modified for seeding techniques. This unit, which requires a relatively low brine recirculation rate compared with other evaporation methods, will be tested by MERDC at Roswell, N. M. The program has been delayed pending availability of the modified film spray evaporator for tests in Roswell.

SUPPORTED BY U.S. Dept. of Defense - Army

5.1217, DECONTAMINATION OF WATER CONTAINING CBR AND OTHER MATERIALS

D.C. LINDSTEN, U.S. Army, Engineer Research & Dev. Labs., Fort Belvoir, Virginia 22060

Technical Objective: Investigate reverse osmosis water purification process for decontaminating water containing CBR agents. Emphasize applicability of reverse osmosis for new proposed lightweight field water purification unit and squad type water purification requirements, with capability of removing CBR agents, turbidity, and excessive dissolved mineral matter.

Approach: Procure prototype reverse osmosis equipment. Conduct a laboratory study of equipment for removing simulated (non-pathogenic) microorganisms and selected radioisotopes from water. Cooperate with Edgewood Arsenal Research Laboratories (EARL) in study of reverse osmosis for removing chemical agents from water.

Progress: Jul 67 - Jun 68. Determine performance of the reverse osmosis (RO) water purification process for removing CBR agents from water. Establish joint investigation with Edgewood Arsenal studying RO for decontaminating water containing significant CW agents, with particular emphasis on V-agents, G-agents and incapacitants. Conduct laboratory studies in-house of RO for removing BW materials; including viruses, spores and cysts; and RW materials, including strontium 85, from water. Study potential water treatment methods of decontaminating water containing newly developed CW agents. Participate with Edgewood Arsenal in evaluation

5.1218, COAGULANT DOSAGE TEST KIT

M. PRESSMAN, U.S. Army, Mobility Eqp. Res. & Dev. Ctr., Fort Belvoir, Virginia 22060

Objective: Develop a simple apparatus and procedure for determining optimum coagulant dosages in field water coagulation practice. It is anticipated that the use of the proposed kit will reduce operator reliance on visual observation and result in significant logistical advantages through more economical and efficient use of coagulation chemicals and improved water filtrability.

Approach: Construct experimental kits. Conduct field jar tests with these kits and compare dosages determined as optimum by kit test with the dosage required to give the best coagulation in the operation of standard field water purification units. Modify the field test kits and/or procedures, as required, to produce better correlation between dosages determined on optimum equipment operation and experimental procedures. Study coagulant dispensing techniques. Construct and evaluate model kits by assignment to personnel operating standard water purification equipment.

Progress: (July 67 - June 68) Several variations of test kit components and operating procedures were studied. Simple procedures for adding the ferric chloride and limestone coagulants and mixing were developed to give consistent results correlating to within 10 ppm of the optimum dosages of coagulants as determined through independent experimental procedures and

equipment operation. The present kit consists of four (4) 8-ounce screw cap coagulation bottles marked at the 200 ml level in a plastic frame, an 8-ounce bottle of powdered limestone, a small (0.05 gram) scoop, a 2-ounce dropper bottle of ferric chloride solution (40 MG/ML), and a carrying case. Sketches of the kit have been prepared for in-house fabrication of a prototype unit.

SUPPORTED BY U.S. Dept. of Defense - Army

5.1219, WATER SUPPLY TECHNOLOGY - WATER QUALITY MANAGEMENT AND PROTECTION

R.P. SCHMITT, U.S. Army, Mobility Eqp. Res. & Dev. Ctr., Fort Belvoir, Virginia 22060

The proposed work under this project is primarily designed to provide a technological base for: (1) simple but effective methods of detecting and utilizing ground water in the field, (2) improved water purification methods for producing water from the earth's sources that are difficult to treat because of unusual sanitary or chemical quality, (3) methods of decontaminating water containing CBR agents, (4) improved methods of removing excessive mineral matter from water and (5) a simple effective method of purifying waste waters in order to renovate them for reuse. Specific investigations under the project include a determination of: (1) the technical feasibility of new methods of ground water exploitation, including a lightweight drilling apparatus, (2) the effects of various hydrophilic colloids and other contaminants on the efficiency of polyelectrolytes in testing fresh non-potable raw water, (3) methods for destroying newly developed lethal and incapacitating type chemical agents in water, including superoxidation and carbon, polymeric and molecular sieve adsorption, (4) scale prevention in distillation by seed nucleation, (5) reverse osmosis for removing CBR agents, excessive mineral matter and other undesirable substances from water, (6) centrifugation for water clarification and (7) methods of renovating waste water for reuse, including mixed media filtration.

5.1220, INVESTIGATION FOR CONTROL OF WATER POLLUTION FROM COMBINED SEWERS IN ROANOKE, VIRGINIA

J.M. STRICKLAND, Hayes Seay Mattern & Mattern, Roanoke, Virginia 24007

The project includes the gathering of field and statistical data necessary to assess sanitary sewer overflow problems and preparing data in a manner that will be useful to others involved in a sewer overflow problem. The Plan of Procedure includes: 1. Smoke testing about 25 percent of system. 2. Gaging all major streams and overflows. 3. Establish design input rate of runoff and/or overflow to control units by hydrograph prepared from data collected. 5. Establish water quality of sewer overflows to permit design of remedial measures. 6. Establish relationship between collection system and sewage treatment plant in terms of quantity and quality of flow resulting from individual storms. 7. Establishment of the feasibility of programming mathematical models for computer analyses of the system hydraulics under various frequency and storm durations. 8. Preparation of preliminary designs and specifications upon which to base choice of alternative solutions in regard to existing technology and new technology. 9. Estimate of results from any proposed remedial measures.

5.1221, EFFECTS OF POLLUTANTS ON SUBMARINE PLANT SYNECOLOGY

M.A. DUBE, Western Washington State Coll., Graduate School, Bellingham, Washington 98225

The purpose of this study is to gain an understanding of the dynamics of subtidal marine plant communities which are exposed to industrial waste outfall as compared to the dynamics of communities located in waters carrying less industrial waste. When possible, the community dynamics will be studied in industrial areas before and after the development of the industrial installation. Communities closer to the source of industrial waste

5. WATER QUALITY MANAGEMENT AND PROTECTION

will be contrasted with those farther away to determine basic differences in (a) plant community structure, (b) productivity of the plant community, (c) the reproductive output of the plants, and (d) plant successional pattern. For example, it may be found that a community which is affected by pollution is arrested in a condition resembling an early stage in the successional development of an undisturbed community.

An attempt will be made to interpret differences in community dynamics in terms of differences in environmental factors by comparing at each site (a) the degree of chemical enrichment and concentration of suspended particles in the water, (b) the degree of siltation of the plants and substrate, and (c) the role of primary consumers. Controlled experiments will be run when possible to determine the separate effects of these factors.

5.1224, EVALUATION OF METHODS FOR QUANTITATION OF FECAL COLIFORM BACTERIA

T.H. ERICKSEN, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

Studies will be continued on the comparison of several methods for the testing of enumeration of fecal coliform organisms in the estuarine area. Among the methods that will be compared are: 24 hr. liquid method, membrane filter method and a plate count method.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1225, EVALUATION OF METHODS FOR RECOVERY OF ENTEROBACTERIACEAE FROM MARINE SOURCES

J.C. HOFF, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

Comparisons of conventional enrichment and isolation media will be made for the detection of pathogenic enterobacteriaceae in estuarine water and shellfish samples. Where necessary, methodology will be improved to meet the unique requirements for the isolation and enumeration of these pathogenic organisms from the marine environment.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1226, INCIDENCE OF PATHOGENIC ENTEROBACTERIACEAE AND ENTEROVIRUSES IN ESTUARINE AREAS

J.C. HOFF, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

Studies on the incidence of pathogenic bacteria and viruses in estuarine areas will be initiated. A sampler based on the gauze pad method will be used to concentrate the microorganisms present in the water. Several estuarine areas in Puget Sound, Washington, of varying known bacteriological quality will be studied.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1227, ACCUMULATION AND ELIMINATION OF VIRUSES BY SHELLFISH

J.C. HOFF, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

Studies will be continued on the effects of the state of poliovirus on accumulation and elimination characteristics in West Coast species of shellfish. Feces from vaccinated individuals containing high levels of attenuated poliovirus will be examined by differential centrifugation to determine the nature of the association of the virus with fecal material. This natural virus reservoir will also be used in accumulation-elimination experiments using Olympia oysters (*Ostrea lurida*).

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1228, DEVELOPMENT OF METHODOLOGY FOR ISOLATION OF VIRUSES FROM SEA WATER

W. JAKUBOWSKI, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

The efficiency of various types of particulate matter as adsorbing agents for the concentration of the virus particles present will be tested under laboratory conditions. The effects of various factors such as presence of dissolved organic matter, salinity and state of the virus on the efficiency of the process will be determined.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

5.1229, BACTERIAL DEPURATION OF WEST COAST SHELLFISH

G.J. VASCONCELOS, U.S. Dept. of Hlth. Ed. & Wel., Pac. Nw. Marine Hlth. Sc. Lab., Gig Harbor, Washington 98335

Studies will be continued on the influence of salinity and turbidity on the depuration of Manila clams (*Tapes japonica*). Studies will be initiated on effect of chemical and physical factors on the depuration of Pacific oysters (*Crassostrea gigas*). Pilot plant studies on depuration, utilizing the information gathered to date, will be initiated.

5.1230, MASS MORTALITY OF PACIFIC OYSTERS ALONG THE WASHINGTON COAST

C. LINDSAY, State Dept. of Fisheries, Olympia, Washington (14-17-0001-1900)

The Department of Fisheries will conduct field and environmental studies on mass mortalities affecting Pacific Oysters as set forth in the following phases: Phase I. Monitoring of Mortality and Growth of Pacific Oyster Seed from 5 Source Areas. 1. Japan, Hokina (High mortality area). 2. Japan, Mongoku-ura (Low mortality area). 3. Washington, Dabob Bay. 4. Washington, Willapa Bay. 5. Canada, Pendrell Sound. Phase II. Float Studies, Eld Inlet. Mortality, growth, fatness, glycogen and histology of 1965 year class (planting) oysters from beds of LeRoy Patterson. Phase III. Transplant Study. Patterson 1965 year class (planting) oysters previously planted at Quilcene Bay, Eld Inlet (Matthews) and Eld Inlet (Brenners) will be transplanted from each station to the other two. Mortality, growth, fatness, glycogen and histology will be monitored. Phase IV. Mortality Monitoring. 1966 (planting)

5. WATER QUALITY MANAGEMENT AND PROTECTION

year class Patterson oysters at Case, Eld, and Totten Inlets and Oakland and Quilcene Bays. Phase V. Commercial Oyster-bed Mortality Monitoring. Northern, central, and southern Puget Sound, Grays Harbor, and Willapa Bay. Phase VI. Cultural Experiments to Circumvent Mortalities. 1967 Japanese year class seed planted and reared in Oakland Bay will be transplanted to North Bay. Commercial stocks (1967) reared in North Bay will be used for controls. Phase VII. Hydrographic Sampling. 1. Continuous recording of water temperature adjacent to oyster stocks at the sampling stations in Quilcene Bay, Eld Inlet (Matthews), and Eld Inlet (Brenners). 2. Eld Inlet. A. Center line of inlet. Vertical distribution of salinity, temperature, O₂, chlorophyll and phosphate. B. Shallow oyster beds. Photosynthetic rate, chlorophyll, phytoplankton species, pH, temperature, salinity, O₂, total and inorganic phosphates, nitrate, nitrite ammonia, soluble and particulate carbohydrates and organic nitrogen, lipids. 3. Quilcene Bay, Oakland Bay, Totten Inlet, and Case Inlet. Salinity, temperature, O₂, chlorophyll, phytoplankton and phosphate. Phase VIII. Standardization of Data Collection Processing and Analysis.

5.1231, PESTICIDE RESIDUE STUDY IN SPORT FISH WATERS

W. BRUNSON, State Dept. of Game, Olympia, Washington

Objective: To monitor levels of pesticide residues in hatchery and other game fish management waters and to evaluate the rate of the effect in fish mortalities.

Procedures: Hold live fish to determine effect of various concentration of pesticides. Determine stress by measuring amounts of 'stress hormones' cortisone and hydrocortisone released in the vascular system.

Establish sand-charcoal filters. The correct proportions of sand and charcoal and length of effective service will be determined by analyses of the effluent.

Conduct gas chromatographic, histopathological and chemical analysis on samples furnished and prepared by Mr. Wayne Brunson, Biologist II, Aquatic.

Prepare reports as well as preparing appropriate aspects of the project for publication in scientific journals.

5.1232, ECOLOGY OF NEMATODES IN IRRIGATION WATER

L.R. FAULKNER, Washington State University, Irrigated Agr. Res. & Ex. Ctr., Prosser, Washington 99350

Investigations are proposed to ascertain the effects of various factors on longevity of nematodes in water and to evaluate nematode contaminated irrigation water as a source of infestations. Longevity of nematodes in water will be determined by suspending mesh cages containing monospecific populations in streams, canals, settling basins and lakes. Effects of temperature, pH, salinity, aeration and microbes will be determined by placing similar cages in controlled temperature baths equipped for water renewal and aeration. Survival will be ascertained by using vital stains and ability of nematodes to recolonize.

Effects of contaminated water on introduction of nematodes into non-infested soils will be studied in fumigated soil beds. The beds will be planted to selected indicator hosts and irrigated with canal or well water. Records will be kept on numbers and kinds of nematodes introduced with water, seasonal population trends, and time required for appearance of economic infestations.

5.1233, STUDIES ON APPLICATION OF RADIOISOTOPE TECHNIQUES IN STREAM POLLUTION PROBLEMS IN THE PULP AND PAPER INDUSTRY

R.M. CHATTERS, Washington State University, School of Engineering, Pullman, Washington 99163 (AT(45-1)1951)

Previous research has shown that paper pulp can be successfully tagged with iridium. Iridium is ideal since it is not normally present in pulp and paper mill systems and it can be activated to produce iridium-192 as a tracer with an appropriate half-life for the application. Current effort is directed toward in-mill research on those problems which the Northwest Pulp and Paper Association deem to be most urgent to reduce the amount of waste material which enters the public waterways. The work encompasses the spectrum from laboratory through actual testing in the plant systems. In addition, attempts will be made to trace additives such as filler clays, TiO₂, alum, and sizing agents using the technique of activation analysis.

5.1234, THE PREDICTION OF WATER QUALITY ASPECTS OF THE WENATCHEE RIVER

H.D. COPP, Washington State University, School of Engineering, Pullman, Washington 99163

A pumped-storage hydroelectric power development has been proposed by the Sponsor on the Wenatchee River, a mountain stream in north central Washington State. Since this river is an important fish spawning stream, tributary to the Columbia River, and since recreation activity is increasing in the watershed, influences of the proposed power project on existing water quality need to be predicted.

Simulation techniques by digital computer are being developed for prediction purposes. Weather phenomena, system hydrology, heat transfer, principles and mixing processes have been programmed for both reservoir and stream waters to compute temperatures and oxygen and nitrogen contents in these waters. A program is operable and is quite general, i.e., it is not tied to the system under consideration. At present, July 1967, program optimization, process simulation mechanics, and logic continuity are under critical review.

5.1235, ADVANCE WARNING OF GROUND-WATER POLLUTION HAZARDS, WITH SPECIAL REFERENCE TO AQUIFERS IN GLACIAL OUTWASH

J.W. CROSBY, Washington State University, Graduate School, Pullman, Washington 99163

It is proposed to study methods of providing advance warnings of pollution build-up so that public health hazards can be avoided. The research is to be done on the Spokane Valley aquifer where conditions now exist which are conducive to contamination of the Spokane water supply. Geoelectrical methods, utilizing both standard and specially designed probes, will be investigated and comparison drawn between electrical properties of the groundwater and water quality analyses. The desirable end result of the project would be to establish rapid, routine methods of identifying polluted zones in stratified groundwaters.

5.1236, ECOLOGY OF SELECTED AQUATIC BACTERIA IN THE SNAKE RIVER

C.H. DRAKE, Washington State University, Graduate School, Pullman, Washington 99163

This study is an investigation of several selected groups of aquatic bacteria occurring in natural waters. Their fluctuations in numbers will be followed over a considerable period of time to see the effect of season, temperature and other variables. There is an excellent opportunity to follow changes in the Snake River since at one point it has received almost no pollution in a distance of almost 200 miles. Then, it shortly receives the sewage of two cities and considerable sulfite waste liquor from a paper pulp plant. Cultural studies as well as observations on periphytic bacteria will be made above and below these points to see the effect these additions have on the normal bacterial flora, particularly in regard to certain sulfur bacteria. Other natural aquatic bacteria will also be studied to see how they are affected by these changes in ecology. This will supply basic data on the stream before its ecology is

5. WATER QUALITY MANAGEMENT AND PROTECTION

drastically changed by the imminent construction of a dam near here.

5.1237, OCCURRENCE OF PESTICIDES IN AQUATIC ENVIRONMENTS

E. HINDIN, Washington State University, School of Engineering, Pullman, Washington 99163

The method of transport to and the occurrence of pesticides in the aquatic environment is of extreme interest today. The increased use of pesticides for achieving higher agricultural and silvacultural productivity has allowed a greater amount of pesticides to enter into the aquatic environment. Though these amounts are generally in sublethal dosages, their presence constitutes a potential hazard. Certain pesticides can be concentrated in tissues of most organisms, thus entering in the food cycle of organisms in the aquatic habitat.

The purpose of this study is two fold. One purpose is to study the distribution of a chlorinated organic and organic phosphorus insecticide on an agricultural plot receiving insecticide application. A distribution budget will be made from analysis of soil, plant, and insecticide removal by irrigation runoff water and loss to the atmosphere taken throughout the growing season. Particular attention will be paid to that amount being carried off by the irrigation runoff water. During the second year insecticides will not be applied. A distribution budget will be made of the insecticides present on the plot. Emphasis will be placed on the insecticides leaching off the field in the irrigation runoff water.

The second purpose of the study is to determine the seasonal variation in the pesticide content of a dimictic and of a polymictic reservoir. Comparison will be made of the pesticide content of the water at specific depths, i.e. Epilimnion, Metalimnion and Hypolimnion. The surface inflows and outflows to the reservoirs will be sampled to better assess the pesticide variation. Samples of aquatic organisms, i.e., plankton, benthos, fish and snails, will be taken to determine the concentration of pesticides in organisms inhabiting the reservoir. Comparisons will be made of the pesticide content of those organisms feeding at specific depths.

5.1238, CLAY MINERAL STABILITY AND WATER COMPOSITION

J.A. KITTRICK, Washington State University, School of Agriculture, Pullman, Washington 99163

It is anticipated that this project would contribute to a better understanding of how the relatively small group of minerals that dominate soils and sediments control and are in turn altered by, the composition of waters with which they are in contact. The specific aim of this project is to obtain standard free energy of formation values of several of these minerals by solubility measurements and to correlate these free energy values with what is known of mineral occurrence and water composition in soils and sediments.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1239, SOILS, PESTICIDES AND THE QUALITY OF WATER

C.D. MOODIE, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

1. To establish whether movement through the soil constitutes a significant source of the pesticides found in surface and ground water. 2. To identify the properties of pesticides and of soils that control the extent of movement of pesticides in and through soils. 3. To ascertain the solubility characteristics of pesticides sorbed on soil particles and hence the effect of suspended soil on the concentrations of pesticides in water. 4. To ascertain the effects of management of pesticides and land on the transport, by all means, of pesticides to water supplies.

The mobility of pesticides in soils of different properties is to be determined by use of soil columns operated as miniature lysimeters. By appropriate arrangement, the lysimeter can

represent various zones or combinations of zones within the root zone of plants. The transport from pesticide-treated to untreated soil layers or to ground water can be followed as affected by such variables as pesticide solubility, dispersability and formulation, soil texture and organic matter, irrigation regime and water quality. The desorption of pesticides from soil into water that may take place as pesticide-treated soil is eroded and suspended in runoff and stream waters. The significance of soil pesticide ratio, and soil properties (clay type, particle size, organic colloid, ion saturation, etc.) will be evaluated.

SUPPORTED BY U.S. Dept. of Agriculture

5.1240, LAGOONS FOR DAIRY FARMS

J. ROBERTS, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

This is a project between the Division of Industrial Research and the Agricultural Experiment Stations. The cooperators are the Sanitary Engineering Section of the Division of Industrial Research and the Departments of Agricultural Engineering and Dairy Science. Four lagoons will be constructed at the Knott Dairy Farm.

The objectives will be to study the bacteriological factors involved in the breakdown of cow manure and methods of speeding up the bacterial action and the management factors, including costs, labor, and water requirements so that design criteria may be developed and made available.

The study as designed will include a comparison of the effectiveness of the three-stage process with recirculation of two different wastes--municipal wastes, and dairy wastes consisting of excreta from dairy cows. Facilities have already been constructed and they are now in operation at the city disposal plant.

Four ponds will be constructed at the Knott Dairy Farm. Plans include placing a diversion box in the present sewer line so that all or any part of the discharge from the present line may be conveyed into the experimental lagoons. The amount of manure from the holding ponds that is conveyed into the lagoons can be controlled by the amount of washing done to the feed yards.

5.1242, FLUSHING OF SMALL SHALLOW LAKES

E.R. TINNEY, Washington State University, School of Engineering, Pullman, Washington 99163

In recent years the quality of lake waters has become increasingly important, first because of the growing demand for recreational uses and, second because the use of lakes and adjacent lands has accelerated their deterioration. Research studies too numerous to mention have dealt with the quality of lake waters but most of the previous work is related to eutrophication and the biological processes involved. In recent years some studies have been made on the currents in a lake which markedly affect the limnological behavior but these studies have, for the most part, dealt with mixing phenomena associated with wind and the density currents associated with solar heating and relatively cold inflows.

The question of how best to improve a small lake by enhancing natural flushing has received little attention. This proposal treats this particular problem with specific attention to the flushing of a small shallow lake. The primary objective of this study will be to clarify the flushing phenomena in small lakes, recognizing

5. WATER QUALITY MANAGEMENT AND PROTECTION

ing that mixing is also enhanced in natural water bodies by wind and solar heating. Hopefully the end result of this would be an explanation of flushing that would indicate how much and in what manner water should be introduced into a class of small lakes to achieve a prescribed flushing action.

5.1243, ALUMINA COLUMNS FOR THE SELECTIVE REMOVAL OF PHOSPHORUS FROM WASTEWATERS AND THE ULTIMATE DISPOSAL OF PHOSPHORUS AS CALCIUM PHOSPHATE

L.L. AMES, Battelle Memorial Institute, Richland, Washington 99352

The proposed study objectives are: (1) to evaluate operating parameters of alumina (boehmite) columns for the selective removal of phosphorus from secondary sewage effluents and other phosphorus - containing waste-waters; and (2) to study alumina regeneration and phosphorus recovery for production of a saleable calcium phosphate product. The research will include studies of (1) boehmite column operating parameters, (2) effect of sodium hydroxide on phosphorus elution from boehmite, (3) elution of phosphorus from sodium hydroxide solutions, and (5) weight loss of the boehmite column with cyclic use.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1244, MECHANISMS OF ENVIRONMENTAL EXPOSURE

J.F. HONSTEAD, Battelle Memorial Institute, Richland, Washington 99352

Effluents from Hanford production facilities transport a certain amount of radioactive material into the populated environment adjacent to the plant, principally by way of the Columbia River. Radionuclides from these effluents may provide a significant portion of the radiation exposure of certain population groups as the result of a variety of mechanisms which transfer them through food chains into man or into his immediate environment. To provide a continuing evaluation of such exposure to local population groups requires an appreciation of the amount and rate of transfer of radionuclides through the environs and statistically the dietary habits and activities of the people involved. This project investigates quantitatively such mechanisms. Means of investigation are statistical studies of whole-body counting data and dietary questionnaires, and associated population surveys. Controlled ingestion experiments utilizing locally-produced foods are also part of the investigation. Of particular interest is large-scale whole body counting experience with local school children. These measurements are accompanied by a dietary study.

SUPPORTED BY U.S. Atomic Energy Commission

5.1245, A THREE DIMENSIONAL STUDY OF PARAMETERS RELATED TO THE CURRENT DISTRIBUTION IN LAKE ROOSEVELT

R.T. JASKE, Battelle Memorial Institute, Richland, Washington 99352

The proposed research plan involves the measurement of flow jet currents within Lake Roosevelt during the stratified period in order to permit mathematical modeling of reservoir water quality, primarily temperature. The field data would be combined with four years of previously collected temperature data in order to develop additional assurance that jet currents and temperature profiles can be correlated. The resulting information would be used to develop equations of state and continuity for the reservoir hydraulic regime.

Field investigations would consist of: (1) A series of two dimensional flow profiles taken at from ten to fifteen stations selected axially to the current flow. (2) A concurrent set of temperature traverses and profiles taken simultaneously with the current measurements. (3) Aircraft surveys at intervals to map thermal gradients outside the scope of boat party surveys.

Laboratory investigations would include: (1) Statistical processing of collected data. (2) Operations research supporting development of input-output models of general application.

5.1246, EFFECT OF REACTOR EFFLUENT ON QUALITY OF COLUMBIA RIVER WATER

R.T. JASKE, Battelle Memorial Institute, Richland, Washington 99352

Effluent cooling water from the Hanford production reactors has effects on the thermal and chemical characteristics, and radionuclides content of the Columbia River. Substantial quantities of the released effluents disperse throughout the mainstream and eventually interact to some extent with the environment. It is the purpose of this study to define the extent of this interaction by measurements of the appropriate upstream and downstream parameters for comparison and correlation. Included are the development of relatively sophisticated digital computer models which serve not only as analytical tools, but as a means of proving highly refined estimates of flow times, concentrations, and other time-dependent phenomena in the event of plant accident. Associated with this program are detailed investigations of dye and rare-earth tracer technologies, and the mechanisms associated with filter plant operation on radionuclide and inorganic ion concentration. This program includes the incidental analysis of the effects of upstream dam regulation (for the exportation of peaking power out of the region) on the temperature of the Columbia below the Hanford plant, as a result of the extreme variations in available dilution flow below Priest Rapids Dam.

5.1250, TREATMENT AND DISPOSAL OF CONDENSATE WASTES FROM HIGH LEVEL WASTE SOLIDIFICATION PROCESSES

A. PLATT, Battelle Memorial Institute, Richland, Washington 99352

A number of low and intermediate level waste side streams result from processes now being developed for the solidification of power reactor fuel reprocessing wastes. These side streams are characterized by low volume, high acid or salt content, and significant levels of radioisotopes, particularly those which exhibit high vapor pressures at the elevated temperatures involved in solidification. This program involves development of techniques for treatment and disposal of these waste side streams.

A number of concepts including precipitation, fractional distillation, scavenging, and crystallization have been evaluated, present emphasis is being placed on sulfate distillation and incorporation of residue in asphalt. Studies will be extended to actual waste streams when they become available in the near future from a current demonstration of waste solidification. The program was initiated in FY'66 and is expected to be completed in FY'69.

5.1256, ANNUAL PHYTOPLANKTON PRODUCTION IN PUGET SOUND WATERS

G.C. ANDERSON, Univ. of Washington, Graduate School, Seattle, Washington 98122

Studies of phytoplankton production are being continued in Puget Sound. The investigation, since 1964, has provided quantitative information on annual phytoplankton production and mean standing crop in two areas of the Sound.

The research proposed herein is to elucidate the reasons for the very large blooms off Seattle when maximum values of 6-7 g C/square meter are photosynthesized per day. Weekly, daily and diurnal sampling will be carried out during periods of high phytoplankton production along with measurements of hydrographic conditions, light and nutrients. Particular attention will be given to the effect of stability, as affected by tides and winds, on the timing of phytoplankton blooms. Measurements will be made of the chemical composition of the crop as well as growth rates of dominant species.

Experimental work involving studies of phytoplankton blooms in enclosed columns of water in situ will be carried out. In this manner, the effects of advection will be eliminated. Culture studies will be conducted with some of the herbivorous copepods.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1257, NITRATE REMOVAL FROM ACTIVATED SLUDGE SYSTEMS

D.A. CARLSON, Univ. of Washington, School of Engineering, Seattle, Washington 98122

The proposed research plan is concerned with the biological removal of nitrates in used waters. The investigations would be based on operation, analyses and observation of a pilot plant denitrification unit recently constructed at Municipality of Metropolitan Seattle's West Point Waste Treatment Plant.

Field observations would study effects of season, waste concentration and composition, and nitrogen concentrations on nitrate removal efficiencies of the pilot plant.

The pilot plant is constructed so as to permit modification of operational conditions so that the results of the pilot plant study can be used to predict optimal design conditions for construction of full scale plants to remove nitrates by biological means.

5.1258, WASTE WATER ODOR REDUCTION MECHANISMS IN SOIL FILTERS

D.A. CARLSON, Univ. of Washington, School of Engineering, Seattle, Washington 98122

The purpose of this study will be to investigate the process involved in the removal of odorous compounds in soil filters. Previous work at the University of Washington indicates that the process of hydrogen sulfide degradation in soil filters is biological in nature, but further research is needed to establish the organisms responsible, to attempt pure culture studies with isolated colonies to verify column activity, and to establish optimum conditions for their growth and ability to degrade test compounds.

Other phases of the research will consider changes in soil properties during test gas application, accumulation of deposited products in the soil, gas pressure requirements under various gas flow conditions and development of optimum conditions for long period use of soil filters.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1259, CHEMICAL CHARACTERISTICS OF ORGANIC COLOR IN WATER

R.F. CHRISTMAN, Univ. of Washington, School of Engineering, Seattle, Washington 98122

In previous research (WP-00558) effort was directed toward the development of a satisfactory degradation technique for studying the chemical nature of color molecules. Now that such a technique is available support is herein requested to extend this research in the following specific areas: (1) Determination of the uniformity of chemical structure among the color producing molecules in waters from a variety of sources and the dependence of chemical structure on various environmental parameters. (2) Investigation of the mechanism of coagulation of organic color by hydrolysis products of Al(III) and Fe(III).

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1260, DISTRIBUTION OF DEMERSAL FISHES IN INSHORE WATERS

T.S. ENGLISH, Univ. of Washington, Graduate School, Seattle, Washington 98122

This study will consider distribution of demersal fishes with area, season, depth, bottom sediments, hydrographic variables, and available food. Samples will be taken with small otter trawls (16 foot headrope) and beam trawls (3-meter beam). The distance trawls travel over the sea bottom will be measured with a pacer; a record of trawl depth with time will be taken with a bathymograph; a fathometer record will be kept. Fishes will be examined by species, length, weight, age, sex, sexual maturity, and stomach contents.

Data will be programmed for computer analysis. Analysis of variance techniques will be used to study main effects, interactions, and components of variance. Determinations of experimental error will be used to specify the density of sampling required to obtain confidence limits of stated length. Biomass changes will be related to several variables; species associations, feeding habits, condition factors, and seasonal cycles will be examined. Growth and mortality rates of young age classes can be estimated by progression with season of length-frequency modes.

Results of this study will be integrated with results from concurrent research of other workers on benthic invertebrates - bottom environment and plankton production - pelagic environment.

5.1262, STUDIES OF LOW MOLECULAR WEIGHT LIGNIN SULFONATES

J.L. MCCARTHY, Univ. of Washington, School of Engineering, Seattle, Washington 98122

Research on the preparation and characterization of lignin sulfonates of low molecular weight and/or fractions of same, is to be continued.

In very recent work, it has been found that better controlled Sephadex chromatographic column separations are obtained when the experiments are conducted using aqueous solutions of approximately constant ionic strengths, i.e., under 'swamping' conditions. Since earlier experiments have been conducted without this control, we now propose that further Sephadex separation studies be conducted under conditions of constant ionic strength.

We also have found very recently that lignin sulfonate molecular weight averages, and, indeed approximations to the distribution of molecular weights, can be estimated effectively by use of a short column sedimentation equilibria technique. We now propose to apply this to the separated lignin sulfonate fractions. Other techniques of physical and organic characterization of lignin sulfonate will also be applied.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1263, STEAM STRIPPING OF KRAFT PULP MILL EFFLUENT STREAMS

J.L. MCCARTHY, Univ. of Washington, School of Engineering, Seattle, Washington 98122

The broad objective of the presently proposed research is to improve the effectiveness and to extend knowledge concerning the possible industrial applications of the 'SEKOR' process which, in essence, comprises the counter-current steam stripping of Kraft pulp mill condensate streams in order to bring about the removal of steam-volatile organic compounds from the fluid and thereby provide relatively clean effluent water which can be reused in pulp mill process or else discharged without danger. The volatilized organic substances are condensed to yield water-immiscible 'SEKOR oils' which may find uses in commerce. Use of the process may also result in a substantial decrease in the odorous substances emitted into the atmosphere from Kraft pulp mills.

5.1264, INTERNAL CURRENTS RESULTING FROM INTERMEDIATE DENSITY INFLOWS INTO STRATIFIED RESERVOIRS

R.E. NECE, Univ. of Washington, School of Engineering, Seattle, Washington 98122

The objective of this laboratory study is to investigate one of the mechanisms by which reservoirs become stratified. To be studied are the current structure and longitudinal and vertical distribution within the reservoir of waters which are intermediate in temperature between the warmer surface waters which have been exposed to solar heating and the colder, denser waters at great depth; the water of intermediate density enters the sloping inlet (original river channel) at the upstream end of the reservoir.

Specific objectives are to study the effects on reservoir current and temperature distributions of such variables as: temperature, depth, and velocity of the inflow stream; slope of inlet channel; and initial temperature profile in the reservoir. Preliminary studies are to be made using simple laboratory apparatus in which the above variables may be varied systematically.

Results are to be compared with other solutions (analytical and experimental) previously found in studies of selective withdrawal from reservoirs; these conditions prevail 'downstream' from the region to be studied here, in which stratified flow becomes established.

5.1265, SALT WATER ENTRAINMENT FOR DILUTION IN SEWER OUTFALLS

R.E. NECE, Univ. of Washington, School of Engineering, *Seattle, Washington* 98122

This investigation is an experimental and analytical study of the mechanism of the entrainment of a fluid into a conduit passing through an infinite volume of this ambient fluid and through which flows a different fluid. The particular motivation is to obtain basic information which could be applied in the sanitary engineering design of sewer outfalls discharging into salt water. In this case, where density differentials exist, entrainment of salt water into the outfall prior to ultimate discharge would decrease the density differential between effluent and receiving water, thereby decreasing the amount of diffusion necessary to produce acceptable sewage concentrations at the water surface. Such entrainment could be accomplished by providing appropriate inlets through the wall at a reduced-pressure 'venturi' section in the outfall pipe.

This study is to treat a few relatively simple geometries in some detail. Attention is to be focused on those factors influencing entrainment rates, namely: density and pressure differentials between ambient and initial conduit fluids, velocity of approach in the conduit, and inlet geometry. Mixing patterns within the conduit are to be studied. It is planned to extend the tests to the case of an ambient fluid which is in motion.

5.1266, SYSTEM ANALYSIS OF EUTROPHICATION CONTROL BY FLUSHING

R.T. OGLESBY, Univ. of Washington, School of Engineering, *Seattle, Washington* 98122

This research project is designed as an intensive study of a highly eutrophic lake before and after additions of nutrient poor flushing water. System analysis techniques will be applied to this information, together with data obtained through laboratory and field experiments, to meet the following objectives: (1) establish knowledge and information concerning the functional performance and effectiveness of flushing as a means of eutrophication control; (2) define the engineering concepts, design procedures, and design criteria necessary for the general application of this method; and (3) further understanding of the relationship of primary production to the environment in which it occurs. A further objective is to promote significant improvements in the water quality of that portion of the lake under study most densely inhabited and most intensively used for recreation.

5.1267, BACTERIOLOGICAL AND ESTHETIC OF PLEASURE BOAT WASTE DISCHARGE ON SMALL HARBORS

R.W. SEABLOOM, Univ. of Washington, School of Engineering, *Seattle, Washington* 98122

The proposed research will involve field studies to determine and document the bacteriological pollution caused by the waste discharge from small pleasure craft in small harbors. Both fresh water and salt water harbors will be studied. The possible esthetic degradation of water quality will also be determined by visual surveillance of the water during periods of maximum boat activity. The bacteriological analysis will be initiated in the field and will be by the membrane filter technique.

5.1268, COLUMBIA RIVER STUDIES

A.H. SEYMORE, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

Of the four studies greatest attention will be given to the effects of ^{65}Zn , ^{51}Cr , and ^{90}Sr on oyster larvae. Oysters are

brought to the spawning condition in the laboratory by manipulation of water temperature. Upon fertilization the eggs are placed into containers each with two liters of water of various radionuclide concentration. The experiment is terminated two days after fertilization at which time the oyster is in the straight-hinge larvae state. Later the larvae are classified as normal and abnormal and counted. Information from this experiment is related to waste disposal, oyster growing and to the controversy concerning the effects of radionuclides upon pelagic eggs and larvae of marine fishes. In other studies the geographical limit of distribution of Columbia River water along the Washington coast will be determined by monitoring ^{65}Zn in mussels; a compilation of Hanford produced radionuclides in marine organisms will be prepared; and, the biological half-life of zinc in oysters will be determined by use of ^{65}Zn and a small animal whole body counter. After feeding ^{65}Zn to the oysters for a day or two only at the beginning of the experiment ^{65}Zn measurements will be made periodically of individual oysters living in a natural environment except for the time they are transferred to and from laboratory for whole body counting.

Although the above studies are a new program, prior work does provide some pertinent information. Mussels along the outer Washington coast have been monitored for ^{65}Zn but now the sampling will be extended into the Straits of Juan de Fuca and Puget Sound. Much information from several sources is available on Hanford produced radionuclides in marine organisms. These data will be compiled and supplemented by a limited amount of new information. Also in the past the biological half-life of zinc in oysters has been determined by destructive sampling from lots of oysters transferred between ^{65}Zn contaminated and non-contaminated waters, Willapa Bay and Puget Sound respectively. This time the loss of ^{65}Zn in individual oysters will be followed as the oyster will not need to be sacrificed to make the ^{65}Zn measurement.

5.1269, RESPONSES OF FISH TO ENVIRONMENTAL STRESSES

L.S. SMITH, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

To correlate changes in blood circulation and excretion of fish with changes in environmental stress.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1270, BIOLOGICAL MODELS OF FRESHWATER COMMUNITIES

F.B. TAUB, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

Ecosystems with defined species composition will be constructed as models of natural communities.

The interrelationships between species diversity (the experimental variable) and species abundance, population stability and productivity on the population and ecosystem level will be studied.

When suitable models are achieved, the ecosystems will serve as test systems for various environmental stresses including the addition of nutrients (metropolitan pollution) and introduction of competing species (pest introduction).

The long-term goal is a better understanding of the mechanics that regulate natural communities and their ability to adjust to disturbance.

5.1271, INFLUENCE OF INDUSTRIAL AND MUNICIPAL WASTES ON ESTUARINE AND OFF SHORE WATER QUALITY

J.F. SANTOS, U.S. Dept. of Interior, Geological Survey, *Tacoma, Washington*

This project is being carried on in cooperation with the Municipality of Metropolitan Seattle.

5. WATER QUALITY MANAGEMENT AND PROTECTION

A major objective is to study the influence of industrial and municipal waste disposal on all phases of water quality, chemical, physical, ecological, and sanitary in fresh, brackish, and saline environments. Measurements made with multiple parameter water quality recorders at four sites on the Duamish River estuary are the basis for the attempted correlations. Parameters recorded include dissolved oxygen, specific conductance, water temperature, pH, turbidity and solar radiation index. Computer programs will be written to analyze these data and to detect significant relations.

Seattle City Government - Washington

5.1272, POLLUTION PREVENTION BY AERATION OF FRUIT PROCESSING WASTES

L. ESVELT, Snokist Growers, Yakima, Washington

The project involves a study of three methods of aerobic biological treatment of wastes from a fruit processing plant. The methods to be studied include a completely mixed aerated lagoon, a completely mixed activated sludge system, and a modified contact stabilization process. Oxygen transfer rates and utilization rates will be determined, and sludge dewatering studies will be made. A study of possible installation of solids removal equipment in the plant will be made as a possible method of reducing waste volumes and reducing of sugar leading into the carriage waters.

5.1273, LIMESTONE DRUM PRODUCTIVITY STUDY

R. MENENDEZ, State Dept. of Nat. Resources, Charleston, West Virginia

Limestone aggregate is being dissolved in revolving drums powered by stream flow (Zurbuch, 1963) and resultant effects on water chemistry and biology assessed. The project includes both lentic and lotic environments. A 4-drum treatment station is located on a poorly buffered acid stream (Otter Creek) and a 4-drum station located on the inflow of a 165-acre infertile lake (Sherwood Lake). The former has potential for a native brook trout (*Salvelinus fontinalis*) fishery; the later is primarily a largemouth bass (*Micropterus salmoides*) fishery.

The fish population study involves collection of data on the fish populations including species composition, production per unit area, food studies, and age and growth data. Collections are made with electrical shocking gear, netting, and chemical collection procedures. Data will be analysed to determine any change in growth and mortality rates, and increases in standing crop which may have occurred since the beginning of the project.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
West Virginia State Government

5.1274, LIMESTONE DRUM PRODUCTIVITY STUDY JOB NUMBER 3 - ECONOMIC EVALUATION

R. MENENDEZ, State Div. of Game & Fish, Charleston, West Virginia

Limestone aggregate is being dissolved in revolving drums powered by stream flow (Zurbuch, 1963) and resultant effects on water chemistry and biology assessed. The project includes both lentic and lotic environments. A 4-drum treatment station is located on a poorly buffered acid stream (Otter Creek) and a 4-drum station located on the inflow of a 165-acre infertile lake (Sherwood Lake). The former has potential for a native brook trout (*Salvelinus fontinalis*) fishery; the later is primarily largemouth bass (*Micropterus salmoides*) fishery.

The economic evaluation phase of this study is directed toward analysis of treatment methods and benefits derived from an increase in sport fishing. Treatment will be evaluated as to cost of station installation, maintenance costs, and operational costs. These will be in turn evaluated on cost per unit of area and volume of flow or acid effectively treated. Fishery benefits will be computed through increased fish production provided and assigning values anglers would expend for such fishing.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
West Virginia State Government

5.1275, LIMESTONE DRUM PRODUCTIVITY STUDY JOB NUMBER 1 - LIMNOLOGICAL STUDY

R. MENENDEZ, State Div. of Game & Fish, Charleston, West Virginia

Limestone aggregate is being dissolved in revolving drums powered by stream flow (Zurbuch, 1963) and resultant effects on water chemistry and biology assessed. The project includes both lentic and lotic environments. A 4-drum treatment station is located on a poorly buffered acid stream (Otter Creek) and a 4-drum station located on the inflow of a 165-acre infertile lake (Sherwood Lake). The former has potential for a native brook trout (*Salvelinus fontinalis*) fishery; the later is primarily a largemouth bass (*Micropterus salmoides*) fishery.

The limnological phase of this project, presently in its fourth year, involves collection of data on stream and lake temperatures and chemistry, bottom fauna populations, lake water fluctuations, lake plankton and light penetration, and stream flow measurements. Data will be analysed for changes in water chemistry resulting from the dissolved limestone, and qualitative and quantitative changes in bottom fauna and lake plankton.

5.1276, TOLERANCE AND CYTOLOGICAL RESPONSE OF ALGAE TO MINE WATER

H.D. BENNETT, West Va. University, Graduate School, Morgantown, West Virginia 26506

Field and laboratory studies are to be conducted to gain further information on the tolerance of algae to mine water and the cytologic effects of mine water on the algae. This is to obtain information on what specific factors of mine water affect the occurrence, establishment, and abundance of algae in mine water, and to determine adaptations of algae that permit or do not permit tolerance to pollution.

Studies are to be made with collections from natural habitats, from field cultures, and cultures in the laboratory. The study will make use of algae known to be tolerant, algae not known to be tolerant, acid mine water, non-acid mine water, and non-polluted water. Physical and chemical factors of the water to be determined will include the major contaminants known to be characteristic of mine water. The cytological characteristics will be studied with the aid of the bright field, phase, and the electron microscope.

The laboratory and field data will be processed to permit drawing of conclusions, based on this and related work, that will help clarify algae-mine water relationships, and to point toward continuing research needed.

5.1277, FISH ECOLOGY AND PHYSIOLOGY IN RELATION TO ACID MINE DRAINAGE

A. BENSON, West Va. University, Graduate School, Morgantown, West Virginia 26506

The investigation seeks to relate water quality criteria to fish ecology in a mine acid polluted environment.

Study phases include: (1) seasonal relationship of fish distribution to changes in concentration of mine acid constituents; (2) distribution in environmentally graded habitats including tributary backwaters, sewage outfalls and river confluences of acid mine streams; (3) food availability and consumption; (4) evidence for ecological stress as indicated by species and age structure of populations, growth rate, condition factor, degree of reproductive success, and presence of developmental anomalies; (5) short term toxicity tests of acid mine water and chemical constituents of mine water. (6) Evidence for physiological stress in long term experiments based on sublethal concentrations of acid mine water constituents.

5. WATER QUALITY MANAGEMENT AND PROTECTION

A principal objective is the development of ecological and physiological criteria as a basis for review and possible modification of water-quality standards for aquatic life in water subject to acid mine pollution.

5.1278, GROWTH OF THE BROWN BULLHEAD, *ICTALURUS NEBULOSUS* (LESUEUR), IN MINE ACID POLLUTED WATER

A. BENSON, West Va. University, Water Research Institute, Morgantown, West Virginia 26506

The study is an evaluation of the environmental effects of acid mine water on growth rates of the brown bullhead, *Ictalurus nebulosus* (Le Sueur). The investigation is based on evident tolerance of this species to acid conditions and its possible management potential in acid water.

The procedural research plan includes: (1) comparative sampling of brown bullhead populations in acid and non-acid bodies of water; (2) collecting data on environmental conditions; (3) determining growth rates; and (4) collecting supplemental data on food habits and on food availability.

The results are expected to be useful in management planning for sport fisheries, in establishing water-quality criteria, and in planning future research.

West Virginia University

5.1280, STUDIES ON AQUATIC STALKED BACTERIA

V.F. GERENCSEK, West Va. University, School of Medicine, Morgantown, West Virginia 26506

Fresh surface waters will be examined for stalked bacteria which will be identified by their morphology. Correlations will then be made between these organisms and other microorganisms present in the water as well as with the physical and chemical properties of that water. Attempts will then be made to isolate the stalked bacteria in culture for further studies of their growth characteristics, cytology, and genetics.

In this way the ecological significance and taxonomic position of the aquatic stalked bacteria will be elucidated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1281, PHYSIOLOGICAL EFFECTS OF SUBLETHAL LEVELS OF ACID WATER ON FISH

W.J. PEGG, West Va. University, Graduate School, Morgantown, West Virginia 26506

The project proposes to determine metabolic rates by indirect calorimetric methods; eg, measurement of oxygen consumption of sunfish and bullheads which have been subjected to different laboratory controlled aquatic environments. The environment will consist of acid waters with pH ranges about 6.0 to 3.0 and cold total acidities varying from 3 to 70 mg/l CaCO₃. The environmental waters will be composed of combinations of acid coal mine drainage water and solutions of sulfuric acid diluted with natural river water and constituted river water. Calcium levels are to be varied in the test waters to determine whether or not increased levels of environmental calcium can reduce the effect of acid water. If oxygen consumption is a valid measure of

energy utilization in fish, then increased metabolic rate under acid water conditions would indicate that the fish must expend energy to compensate for the stress induced by the environment.

This research proposes to add metabolic rate data relative to the acid environment typically found in the Monongahela River basin. It also proposes to evaluate the relative tolerances of native river fish to the acid environment. The study may also be considered as an effort to gain more appropriate water quality criteria applicable to the problems of reclamation and maintenance of a sport fishery in the Monongahela River basin.

5.1282, PHOSPHATE UPTAKE, STORAGE, AND RELEASE BY MICROORGANISMS IN WASTEWATER TREATMENT

W.A. SACK, West Va. University, School of Engineering, Morgantown, West Virginia 26506

The objective of this investigation is to understand and develop the capability of heterotrophic microorganisms to remove phosphate from wastewater. The first phase of the work will seek to determine how the uptake and turnover of phosphorus depend on the presence and level of a metabolizable substrate. Batch and continuous culture techniques will be used to simulate in a controlled manner the actual conditions of sludge contact with waste. The substrate-to-microorganism ratio will be varied over a wide range to observe the phosphate uptake per cell in growth situations. To closely follow the flow of phosphate, rigorous phosphate balances will be made on the cell mass and substrate. The second phase of the study will be an investigation of cellular storage of phosphate. Complex polyphosphates accumulate in a wide variety of organisms under certain conditions which limit their usual synthetic activities toward growth and division. In waste-treatment systems, carbon is the parameter limiting cellular growth. Observations therefore will be made for inorganic polyphosphate storage under carbon limiting conditions. The substrate limitation will be enforced on the culture under various patterns and cycles of loading.

Estimates of stored polyphosphates will be made by staining procedures and by chemical analyses. Chemically defined media will be used. Pure cultures and mixed cultures representative of those found in wastewater will be employed.

5.1283, BIOLOGICAL TREATMENT OF SPENT VEGETABLE TANNINS

W.A. SACK, West Va. University, School of Engineering, Morgantown, West Virginia 26506

The overall objective of the proposed study is to determine the feasibility of biological treatment of spent vegetable tannins and other color-producing substances in vegetable tan-house waste. Specific objectives are to: Study the kinetics of adsorption of the tannins on biological sludge; determine what part of the complex tannin extract is biodegradable by an adapted culture, and if degradation will proceed to a point of significant color reduction; study the effect of supplemental carbon sources on the extent and rate of oxidation; obtain data on sludge settleability, required detention times, allowable waste strength, and sludge concentration that may be useful in design of an oxidation ditch for treatment of tannery waste. The investigation will be a bench-scale study using spent vegetable tans containing both condensed and hydrolyzable tannins. A mixed culture developed from a domestic-waste investigation is designed to supply basic information on the adsorption and biodegradation of tans that will be useful in design of a pilot or full-scale unit. The study is directed toward the oxidation-ditch method of treatment.

5. WATER QUALITY MANAGEMENT AND PROTECTION

West Virginia University

5.1284, ACID MINE DRAINAGE MICROBIOLOGICAL STUDIES

H.A. WILSON, West Va. University, School of Agriculture, Morgantown, West Virginia 26506

The proposed studies will be concerned with: 1. The isolation and identification of the heterotrophic acid tolerant bacteria in sewage polluted acid mine drainage streams. These isolates will be compared with those isolated in sewage polluted 'normal' (non-acid) streams; 2. the isolation of yeasts and true fungi from sewage polluted acid mine drainage streams. These also will be compared with isolates from non-acid streams; and to determine the role yeasts may play in sewage decomposition under the acid conditions; 3. to determine the amino acids and carbohydrates in sewage (by chromatography) and to compare their decomposition rates under 'normal' (non-acid) conditions with their decomposition rates in acid mine water environments.

Yeasts become the predominating microorganisms in sewage-acid mine water mixtures under laboratory conditions and these microorganisms also occur in streams with those characteristics. It is not known just what their role is. Two species of yeasts have been encountered in all of the work in our laboratories on studies of sewage decomposition in an acid mine water environment; however, little work was done to determine the role they played.

5.1285, EFFECT OF AN ACID-WATER ENVIRONMENT UPON THE SYNTHESIS OF GROWTH FACTORS BY BACTERIA

H.A. WILSON, West Va. University, School of Agriculture, Morgantown, West Virginia 26506

The research proposes to investigate whether an acidic environment resulting from acid mine drainage interferes with 'self sufficient' bacteria in synthesizing essential growth factors, such as vitamins. The project is a feasibility study to determine a possible design for additional research aimed at new methods of mine-drainage treatment. Bacterial isolates will be obtained from sewage-polluted acid mine drainage and from aerated sewage-acid mine drainage mixtures in the laboratory. 'Self sufficient' bacteria, those capable of synthesizing their own growth factors, will be inoculated into the synthetic medium. After determining reactions to various conditions, growth factors will be added to determine the effects on the isolates. The results will be used to determine additional research.

West Virginia University

5.1286, THE MICROBIOLOGY OF FARM PONDS AND OTHER FRESH WATER SYSTEMS

H.A. WILSON, West Va. University, Agricultural Experiment Sta., Morgantown, West Virginia 26506

To study (1) qualitatively and quantitatively, wherever it seems desirable, the microbiological population of fresh water systems and the factors influencing this population; (2) whether certain special bacterial groups such as cellulose decomposers, nitrifiers, nitrogen fixers, etc., are present; (3) the effect that pesticide and herbicide residues have upon the microbial population of such waters and whether any members of the water microflora are capable of degrading either the active or inert constituents of such materials; (4) the potential danger to livestock drinking from ponds and stagnant pools when heavy algal growths appear; (5) the probable pollution hazards to ponds and streams from garbage dumps, sanitary landfills and domestic sewage from private residences.

Standard microbiological procedures will be the general basis of study. Respirometer apparatus will be used to study the effects of pesticides. Phycological methods will be used to look for algae known to 'poison' water and standard methods of the American Public Health Association will be employed in the search for pollution hazards.

SUPPORTED BY U.S. Dept. of Agriculture

5.1287, FLOOD RUNOFF REDUCTION AND WATER YIELD IMPROVEMENT

J.H. PATRIC, U.S. Dept. of Agriculture, Parsons, West Virginia

Object: To determine relationships between forest conditions and practices and the quantity, timing, and quality of streamflow from forested watersheds; and to improve watershed management in the northern Appalachian Mountains.

Plan of work: The project staff has already determined the effect of forest cutting on a series of experimental watersheds. They are continuing the studies to determine the duration of these effects and effect of subsequent cuttings on the same watersheds. Other studies involving partial watershed treatments and combinations are in process. They are also conducting basic studies on runoff and storage characteristics of the experimental watersheds, changes in microclimate resulting from watershed treatments, and the development of water yield prediction methods.

SUPPORTED BY U.S. Dept. of Agriculture

5.1288, IN-PLANT TREATMENT OF DILUTE WASTES OF THE PULPING INDUSTRY

A.J. WILEY, Pulp Manufacturers Res. League, Appleton, Wisconsin 54911

The purpose of the project will be to demonstrate field-scale, in-plant treatment of dilute pulping wastes utilizing a portable reverse osmosis unit. The in-plant treatment method will be developed to reduce hydraulic loadings on biological secondary treatment systems by concentrating the solids in the waste stream. Development and evaluation of reverse osmosis as a method of recovering clear water for reuse by the mill will be accomplished.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl
Pulp Manufacturers Research League, Inc.

5.1289, COMBINED INDUSTRIAL AND MUNICIPAL WASTE TREATMENT

D. MARTIN, Green Bay Met. Sewage Dist., Green Bay, Wisconsin

The project will be a study, evaluation, and determination of the effectiveness, design, and operating parameters of four alternative biological treatment processes and modifications for treating combined municipal and industrial (primarily paper mill) waste waters. A pilot waste water treatment plant for each process will be determined. Each pilot plant will have a 1 to 10 gpm capacity for combined waste waters. After selecting the most promising process, an existing 60 gpm pilot plant will be modified to suit the selected process and will be operated for a year to demonstrate its performance and to generate performance data. The final objective is to evaluate the design, performance, and use of the systems and to generalize the results for applicability to other locations.

5.1290, NUTRITIONAL ECOLOGY AND COMMUNITY STRUCTURE OF THE PHYTOPLANKTON OF GREEN BAY

P.E. SAGER, Univ. of Wisconsin, Graduate School, Green Bay, Wisconsin 54302

The proposed research involves investigations on the relationship between phytoplankton community structure and nutrient availability. Previous studies have indicated an inverse relationship between species diversity and nutrient availability in the water. In this study, equal emphasis will be placed on the algal cell content of the important plant nutrients, nitrogen and phosphorous. Techniques to be utilized will determine the limiting or non-limiting nature of these nutrients in the algal material itself. The question to be answered is how is nutrient availability reflected in the structure of the community.

The phytoplankton community existing along the nutrient gradients in the Bay resulting from pollution inputs provides a large experimental system in which this question can be explored.

5. WATER QUALITY MANAGEMENT AND PROTECTION

At selected sampling stations, seasonal estimates of community structure will be made from species-abundance enumerations and the subsequent calculation of a species diversity index. Pigment extraction will also be utilized for the estimation of community structure and standing crop. Several physico-chemical variables will be measured concurrently. The data will be examined in a framework which will lead to a better understanding of the factors that regulate structure and metabolism in the phytoplankton community in the face of an ecological disturbance (water pollution).

5.1294, MANIPULATION OF RESERVOIR WATER FOR IMPROVED QUALITY AND FISH POPULATION RESPONSE

T.L. WIRTH, State Div. of Conservation, *Madison, Wisconsin* 53701

The number of small recreation reservoirs (50-200 acres) in Wisconsin's lakeless region is rapidly increasing. The formation of these impoundments alters the downstream channel while the fertility of the region causes the reservoirs to become highly eutrophic with limited aesthetic value due to aquatic nuisances. Recreational angling in the reservoirs appears to be depressed due mainly to intense algal growths and adverse aquatic environments (anerobic hypolimnion) which limit fish production in the steep-sided basins. Different management techniques are being applied to two in-line reservoirs. The downstream impoundment, which first filled in May 1967, is equipped with an outlet structure which continuously discharges hypolimnion water. The upstream impoundment discharges epilimnion water and is being continually mixed to prevent thermal stratification. Quantity and quality (temperature, pH, D. O., transparency, major nutrients, and elements) of the inflow, outflow, and impounded waters are being measured throughout the year. Fish production and harvest are measured through techniques of population estimates, growth

rates, age distribution, and anglers' catch for comparison to previously measured levels. Invertebrate species composition and relative abundance are being measured in both of the impoundments and in the stream below the lower reservoir to ascertain changes brought about by manipulation. Aquatic vegetation changes are also being noted in the stream below.

5.1295, A STUDY OF LAND DISPOSAL OF SPENT SULFITE LIQUOR AT BADGER PAPER MILLS, INC., PESHIGO, WISCONSIN

T.A. CALABRESA, State Div. of Env. Protection, *Madison, Wisconsin*

This cooperative project provides for the determination of the extent of movement of spent sulfite liquor both in depth and laterally from the ground surface disposal areas. This project hopefully will result in determinations of:

1. The influence that the bedrock configuration has on the subsurface movement of the waste sulfite liquor.
2. The effect limerock in the area has, if any, in neutralizing some of the acidity of the waste.
3. The potentiometric distribution of the sulfite liquor both vertically and horizontally in the surficial deposits above the limerock in the vicinity of the disposal sites.
4. The aquifer characteristics both in the unconsolidated and rock aquifers.
5. The quantity of the waste reaching the river.
6. Whether the Badger Paper Mills, Inc., shall abandon the present disposal method in favor of some other treatment method insofar as the Peshtigo River is concerned.
7. Whether such land disposal practice for this type or other strong industrial waste can be safely permitted under similar geological conditions.

SUPPORTED BY Wisconsin State Government
Badger Paper Mills, Inc.

5.1296, A COMPARISON OF TOTAL COLIFORM AND FECAL COLIFORM COUNTS IN STREAM POLLUTION SURVEYS

D.H. SCHUETTPELZ, State Div. of Resource Dev., *Madison, Wisconsin*

The study consists of a literature review and limited field sampling to determine if the fecal coliform, rather than the total coliform count, would be a better indicator of bacterial contamination of surface waters. This study will determine whether the fecal coliform organism will be used in routine stream pollution surveys conducted by the sponsoring department. The field sampling is being conducted below a sewage treatment plant and will provide die-off rates and correlation of the coliform strains in the stream.

All bacterial counts are performed by the membrane filter technique and are accepted as being representative (equivalent to MPN) of the true fecal and total coliform populations. Analyses are performed in accordance with Standard Methods for the Examination of Water and Wastewater (12th ed.) at the Wisconsin State Laboratory of Hygiene.

SUPPORTED BY Wisconsin State Government

5.1297, RESEARCH AND REFERENCE TO SEWAGE EFFLUENT PONDS

W.C. BOYLE, Univ. of Wisconsin, School of Engineering, *Madison, Wisconsin*

The objective of this investigation is to determine base design criteria for stabilization ponds by ascertaining the effects of detention time, organic loading and temperature on pond efficiencies. By the use of two partitions a 5 foot deep pond was converted into three ponds, approximately 35' by 35'. A secondary treated domestic sewage is to be fed on a controlled basis to these three ponds to give the following detention times, 3, 10 and 30 days. The effects of these different detention times are to be determined at various temperatures and organic loadings by conducting tests throughout the year.

The efficiency of these ponds under different experimental conditions are to be determined by use of the following analytical

5. WATER QUALITY MANAGEMENT AND PROTECTION

tests: R.O.D., C.O.D., methylene blue, solids, nitrogen, bacteriological (mainly fecal coliform), chlorides and phosphates. In order to avoid loss of contents by seepage these ponds have to be lined with an impermeable water barrier. Two unsuccessful attempts have been made to install such a barrier by using a butyl rubber liner. Another attempt is currently underway to permit the completion of this investigation during the next fiscal year.

This study, conducted in connection with the Ixonia (Wisconsin) aerated activated sludge treatment plant, was started in the fiscal year of 1966 and is expected to be completed in the fiscal year of 1969.

SUPPORTED BY Wisconsin State Government

5.1298, IMPROVING SURFACE WATER CONDITIONS THROUGH CONTROL AND DISPOSAL OF AQUATIC VEGETATION

H.D. BRUHN, Univ. of Wisconsin, School of Agriculture, Madison, Wisconsin

This research proposes to investigate methods for the more efficient handling of cut aquatic vegetation. Feasible alternatives are sought for present slow and costly methods, which are at the same time compatible with over-all water management programs. Knowledge concerning the physical processing properties of aquatic plants is quite limited. Initially research would be conducted to determine how plants are affected by such standard operations as dewatering by crushing, homogenizing, maceration, etc., the objective being to identify potentially effective procedures.

Following acquisition of certain fundamental handling and processing data, the research can proceed on an applied basis. This second, pilot scale phase will attempt to determine the most practical combinations of methods for transportation and disposal of the entire, unprocessed plant, the entire plant after processing in some manner, complete disposal at the source, or other combinations.

The objective is to alleviate some of the bottlenecks which limit the capabilities of today's aquatic vegetation harvesting machinery to small fractions of rates achieved with agricultural machinery. The high cost of systems and procedures for mechanical control of aquatic vegetation have prevented realistic evaluations of its effectiveness as a management measure in eutrophic waters.

5.1299, BIOLOGICAL NITROGEN FIXATION IN LAKES

R.H. BURRIS, Univ. of Wisconsin, School of Agriculture, Madison, Wisconsin

A mobile laboratory will be equipped for routine analytical work including gas chromatography. This laboratory will be used to study biological N₂ fixation in lakes and on the fringes of lakes. Samples of aquatic flora and of root nodules will be exposed in the field to acetylene under a close approximation of natural conditions. Reduction of acetylene to ethylene will be determined by gas chromatography and will be used as an index of the activity of the N₂ fixing system.

5.1300, INSECTICIDE ADSORPTION BY LAKE SEDIMENTS AS A FACTOR CONTROLLING INSECTICIDE ACCUMULATION IN LAKES

G. CHESTERS, Univ. of Wisconsin, School of Agriculture, Madison, Wisconsin

Detailed Objectives: a. To determine the extent of adsorption of certain insecticides by intact and fractionated lake sediments and the bonding mechanisms involved. b. To relate adsorption to a characterization and classification of lake sediments. c. To ascertain the effect of adsorption on chemical and biochemical degradability.

The extent of insecticide adsorption will be evaluated by equilibration and chromatographic techniques utilizing gas chro-

matographic and radioisotopic methods for insecticide determination. Properties of the insecticides and the sediments controlling the extent of adsorption will be ascertained. The effect of adsorption on the chemical and biochemical degradability will be determined by comparison of degradation rates in the presence and absence of adsorbents. Properties of sediments will also be related to their origin, environment of deposition and location to obtain a classification useful for prediction of the extent of insecticide accumulation in lakes.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Wisconsin

5.1301, CHANGES IN WATER ENVIRONMENT RESULTING FROM AQUATIC PLANT CONTROL

G. COTTAM, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

Heavy overgrowths of rooted aquatic plants, with their attached filamentous algae, constitute a distinct problem in multiple use of lakes for a growing human population. Harvesting of the rooted aquatics clears the lakes of growth that impedes swimming and boating, and also removes the attached filamentous algae. While this harvesting does result in removal of some of the nutrients present in the lake waters, this benefit is probably of little value, since the quantity of nutrients so removed is small in proportion to the total quantity present.

The major questions to be answered in this project are (1) what species are responsible for the majority of the objectionable growth? (2) How do these species respond to the control measure applied? This involves a knowledge of the life history of the species. (3) What is the sequence of species replacement when species are removed? (4) How will differences in depth, currents, and types of bottom affect development of vegetation?

The major emphasis so far has been an analysis of the distribution of the rooted aquatics in relation to water depth, type of substrate, etc., and a study of the response of the plants to different cutting treatments. Chemical control has not been studied because of the difficulty of controlling rate and locale of application, and because of the detrimental effects of poisons on other biological organisms present in the lake.

5.1302, SIGNIFICANCE OF ARTHROBACTER IN ECOLOGY OF WATER AND SOIL

J.C. ENSIGN, Univ. of Wisconsin, School of Agriculture, Madison, Wisconsin

Bacteria belonging to the genus *Arthrobacter* are found in large numbers in soil and water. In some environs they are the predominating single group of bacteria. They comprise an important part of the stable autochthonous microflora. The purpose of this investigation is to explore the role of *Arthrobacter* in soil and water ecosystems. The mechanisms whereby these bacteria are able to maintain fairly constant and large populations, regardless of variations in environmental conditions, will be studied. Resistance to starvation, desiccation, adverse temperatures and other environmental conditions will be compared in both rod and sphere stage cells of the organism. The degradation of cellular macromolecules, reserve materials and intracellular pools will be followed during starvation. The results are to be compared to those obtained with *Pseudomonas*, which are part of the fluctuating, or zymogenous, microflora.

Members of the genus *Arthrobacter* have been found to actively degrade pyridine-ring compounds. A second aspect of this investigation involves studying the pathways and enzymes involved in catabolism of pyridine, nicotinic acid and several herbicide and insecticide derivatives of the pyridine ring.

5.1303, DETECTION OF LIMITING AND SURPLUS NUTRIENTS IN ALGAE

G.P. FITZGERALD, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

5. WATER QUALITY MANAGEMENT AND PROTECTION

Previous reports have described techniques developed for the detection of limiting or surplus phosphorus in algae. The present work involves the evaluation of a technique for determining if algae were limited by their nitrogen supply. It has been shown that labile carbohydrate reserves tend to build up in algae when they are deprived of sufficient nitrogen for normal growth. It is possible to detect these reserves considerably before the total nitrogen content of the algae starts to decrease. The development and loss of the reserve carbohydrate has been used to follow the development of nitrogen starvation and reversal of starvation by the addition of ammonia or nitrate nitrogen. The significance of these tests to algae in general and to the ecology of nitrogen nutrition in water pollution will be further evaluated.

5.1304, ALGAL BIOASSAY TO DETERMINE THE EXTENT OF NUTRIENT REMOVAL BY AWT AT THE WASTE TREATMENT PLANT AT ELY, MINNESOTA

G.P. FITZGERALD, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

Algal bioassays will be used in the determination of the extent of nutrient removal by the advanced waste treatment process at the Waste Treatment Pilot Plant at Ely, Minnesota. The project provides for measurement of algal growth using two algae in 60 preliminary samples and two algae in 110 composite samples representing the feed, the final product, and three intermediate stages from the Shagawa Lake Project pilot plant.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1305, BOTULINUM FOOD POISONING IN RELATION TO FISHERY PRODUCTS

E.M. FOSTER, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Objectives: To study (1) ecology of *C. botulinum* type E in the Great Lakes; (2) conditions affecting spore formation by *C. botulinum* type E; (3) the heat resistance of *C. botulinum* type E spores with the view of establishing minimum times and temperatures that will destroy the majority of spores without damaging marketability of the product; and (4) to establish conditions necessary to prevent growth of *C. botulinum* type E fishery products.

Procedure: Samples of fish, water and mud from the Great Lakes will be tested for *C. botulinum* type E to see if its occurrence can be related to specific environmental conditions. Study cultural conditions of spore formation of *C. botulinum*, observing effects of nutrients, pH, incubation temperature, and time on sporogenesis. Establish minimum temperature and time which will destroy all heat sensitive spores. Determine efficacy of various food additives for purpose of preventing growth of spores which survive the heat process. Salt, benzoate, nitrite and polyphosphate hold promise. When an effective control procedure is found in the laboratory it will be tried on a pilot scale basis with full size equipment operated under normal commercial conditions. Determine consumer acceptability of finished product by qualified taste panels.

5.1306, INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT - A CASE STUDY OF THE WISCONSIN RIVER BASIN

I.K. FOX, Univ. of Wisconsin, Water Resources Center, Madison, Wisconsin

The Problem: Although a substantial amount of research is going forward on the technical and economic aspects of water quality management, relatively little attention is being devoted to the legal, policy, and administrative aspects. New policies and organizational arrangements are being tried but little scientific basis is being provided for institutional change that will assure proper implementation of the kinds of programs required for effective water quality management in the future.

The Objective: Using the Wisconsin River Basin as a region for study the specific objectives are: 1. To assess the advantages of a regional approach to water quality management 2. To evaluate the effectiveness of alternative institutional arrangements for conducting desirable programs of water quality management 3. To appraise the obstacles that are likely to be encountered in seeking desirable institutional changes.

Procedures: The research falls into two broad areas. One group of studies will seek to define the nature of effective programs for water quality management in the Wisconsin River Basin through application of recognized methods of water system design. The other group of studies will evaluate the effectiveness of alternative institutional arrangements for conducting water quality management programs through application of techniques of economic, political, legal, and administrative analysis.

5.1307, STUDY OF THE APPLICABILITY OF EFFLUENT CHARGES TO WATER QUALITY MANAGEMENT IN THE STATE OF WISCONSIN

I.K. FOX, Univ. of Wisconsin, Water Resources Center, Madison, Wisconsin

Many cities and communities in the United States have levied charges upon those who utilize the public sewage collection and treatment systems. However, to our knowledge there is no case where charges have been levied against those who discharge effluents directly into waterways. It is evident that the applicability and utility of effluent charges have not been thoroughly examined on the basis of carefully developed empirical information anywhere in the United States. This proposed study would seek to review the literature and experience on this subject and then test alternative concepts on the basis of empirical data developed for a specific river system.

The objectives of this study are as follows; (1) to arrive at alternative concepts of effluent charges, which may be applicable to the State of Wisconsin and to assess the potential advantages and limitations of each concept, (2) to examine the quality and economic consequences of applying alternative concepts of effluent charges in the Wisconsin River Basin by using empirical engineering and economic data presently being developed at the Water Resources Center.

It is to be emphasized that the report of this study will not recommend for or against the use of effluent charges in Wisconsin, nor will it offer other kinds of recommendations. The goal of the study will be to present completely objective, scientific analysis of all data and materials that can be marshalled so that State policy officials can make intelligent estimates of the physical and economical consequences of adopting one policy or another.

SUPPORTED BY Wisconsin State Government

5.1308, EXPERIMENTAL REVERSAL OF THE LAKE EUTROPHICATION PROCESS

A.D. HASLER, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The proposed research program will attempt to evaluate the hypothesis that artificial acceleration of eutrophication (assuming a fixed, irreducible influx of nutrients) will ultimately result in a decrease in the rate of eutrophication and a temporary increase in production of food and other organic matter.

The majority of experimentation will be done IN SITU, using natural and artificial lake basins (Chippewa and Vilas Counties, Wis.). The acceleration of eutrophication at a predetermined, fixed level of nutrient influx, will be attempted by means of artificial lake circulation and artificial lake warming.

Biological indices of eutrophication, including photosynthetic rates, (14C method), diversity of bacteria and phytoplankton, and rates of zooplankton and fish production will be measured.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.1309, EFFECT OF PESTICIDES ON WILDLIFE,(SONG-BIRDS, HERRING GULLS AND FISH)
J.J. HICKEY, Univ. of Wisconsin, Agricultural Experiment Sta. ,
Madison, Wisconsin

The object of these studies is to evaluate the wildlife side effects of insecticidal use and to work out the kinetics of DDT transfer through different ecosystems.

The avian effects of DDT in Dutch elm disease control have been evaluated on 7 Wisconsin study areas and the transfer of DDT through soils, earthworms and birds is now being measured. A second project is measuring residues in Lake Michigan sediments, fish, and gulls. A third is evaluating the current status of the peregrina falcon in eastern U.S.

SUPPORTED BY Wisconsin State Government

5.1310, SURVEY OF CLOSTRIDIUM BOTULINUM TYPE E
S. HIROSHI, Univ. of Wisconsin, School of Agriculture, *Madison, Wisconsin (FDA)*

Current investigations have stressed the relationship between the vegetative cells and spores of *C. botulinum* type E and living and dead fish. The following preliminary observations have been noted: (1) Vegetative cells of type E when fed to living fish do not become established in the gastrointestinal tract. (2) Similar results were obtained when spores were fed to fish. (3) The organism is unable to establish itself and multiply in the surface slime of living fish. (4) Conversely, the presence of type E toxin in dead fish confirms the expectation that type E can multiply in dead fish in nature and suggests a possible source of contamination of the aquatic environment with this organism. (5) The intestinal tract of fish may become contaminated with type E in the absence of food, if the levels of the organism in the water is high.

Multiplication of type E in muds has been accomplished under laboratory conditions. It has been shown that the nutrient available in autoclaved muds of two geographical areas can support spore germination and growth of type E; however, no growth was observed in the unsterilized replicates. Multiplication of the organism is substrate and temperature dependent but not affected by the incubation atmosphere when phosphate buffer is present.

An enrichment medium containing either potato flesh or peel was evaluated as an improved medium for the detection of type E. This potato infusion medium was compared with Johannesen's medium. The results suggest that the addition of potato infusion may improve the detection of type E in mud and soil samples. The conclusions are tentative and more experimental data are required.

Identification of toxigenic type E colonies using the development of antigen-antibody halos around deep colonies has been unsuccessful. The lack of success is due primarily to false positive reactions. Investigations concerning the establishment and multiplication of type E in or on living fish, conditions necessary for the multiplication of the organism in muds and a practical method of identifying toxigenic colonies are continuing.

5.1311, BACTERIOLOGICAL ANALYSIS OF THE FLOCS OF ACTIVATED SLUDGE OF DOMESTIC SEWAGE
E.F. MCCOY, Univ. of Wisconsin, Agricultural Experiment Sta. ,
Madison, Wisconsin

Engineers have been handicapped by not knowing the identity or having for study pure cultures of the bacteria in activated sludge floes. Among 300 isolates we have obtained 11 of *Zoogloea ramigera* and the remainder are in 12 other genera of bacteria. Only *Z. ramigera* forms floes like those in sewage, grows well in sterilized sewage or in several simple and synthetic media we have devised. Its metabolism and function in sewage disposal is being investigated. The remaining non-floc organisms can be adsorbed to the *Z. ramigera* floes, when they are growing together, and thus one can re-assemble the floes of composite activity. *Z. ramigera* is a very unusual organism and its metabolism extremely interesting on theoretical grounds.

5.1312, RETENTION OF NUTRIENTS AND OTHER POLLUTANTS IN SEWAGE BY SOILS
L.B. POLKOWSKI, Univ. of Wisconsin, School of Engineering,
Madison, Wisconsin

The objective of this study is to determine the ability of a given soil type in retaining or removing nutrients and other indicators of pollution from the effluent of a septic tank-soil absorption system under actual field conditions. The site of this investigation is the Wisconsin Heights High School near Mazomanie, Wisconsin. After determining the direction of groundwater travel, 24 driven point wells were installed in the vicinity of the tile absorption field. The soil consists of a silty clay loam changing to sandy loam underlain by outwash sand and gravel.

Groundwater samples were taken from the wells weekly from April September (1967) and on a bi-weekly schedule thereafter. Analyses were made for BOD, chlorides, detergents (MBAS), nitrogen, phosphorous and coliforms.

5.1313, INVESTIGATIONS OF ZOOGLOEAL FLOCS
G.A. ROHLICH, Univ. of Wisconsin, School of Engineering,
Madison, Wisconsin

The proposed work has been divided into the following general areas: Floc Formation - Studies are being undertaken to determine the quantitative and qualitative factors affecting the flocculation of bacteria of the genus *Zoogloea*.

Metabolism and Growth of Zoogloeal Species - Further work is being undertaken to better understand the metabolism of the *Zoogloeal* species. Identification and taxonomic studies are also being made.

Kinetic and Diffusional Studies - The diffusion of nutrients (including oxygen) through pure culture floc is being studied. Both kinetic and diffusional models will be investigated and tested.

Gravity Settling of Floes - Preliminary studies are being made to better ascertain the factors affecting the density, specific surface and shape of pure culture floes that might affect settling properties.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1314, EUTROPHICATION OF NATURAL WATERS
G.A. ROHLICH, Univ. of Wisconsin, Water Resources Center,
Madison, Wisconsin

The research objectives of this multidisciplinary program are to make indepth studies on the eutrophication of natural waters. Among some of the specific objectives are: 1. Determine the cause-and-effect relationship between natural aging of lakes and inadvertent enrichment which leads to short-term changes in water quality in terms of physico-chemical and biological factors. 2. Develop methods of forecasting variations in quality of lake waters by the examination of early trends. 3. Contrive methods of management to control optimum quality of lake waters for municipal, industrial, agricultural, and recreational uses and to arrest or reverse eutrophication trends. 4. Examine the interrelationships among several variables pertaining to the process of eutrophication and exclude those which prove to be of doubtful value for continuing interdisciplinary comprehensive studies. 5. Establish a research program that will generate the kinds and amounts of data needed for systems analysis of the total problem by a competent environmental scientist.

5.1315, ENTEROCOCCI, COLIFORM BACTERIA AND BACTERIOPHAGES IN LAKE WATER
W.B. SARLES, Univ. of Wisconsin, Agricultural Experiment Sta. ,
Madison, Wisconsin

This project is inactive at present because a qualified assistant could not be found. The purpose of the work is to ascertain whether bacteriophages specific for coliform bacteria and for enterococci can be detected in polluted water, and to determine

5. WATER QUALITY MANAGEMENT AND PROTECTION

their persistence in water. Information on persistence of bacteriophages in water is needed to complement knowledge on longevity of coliform bacteria and of enterococci in polluted waters. During the past three years preliminary studies have been made, but these have not yielded conclusive results.

SUPPORTED BY Wisconsin State Government

5.1316, SHALLOW GROUND-WATER FLOW SYSTEMS IN RELATION TO INDUSTRIAL AND MUNICIPAL WATER SUPPLY AND WASTE DISPOSAL REQUIREMENTS

D.A. STEPHENSON, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The occurrence and seasonal fluctuations of shallow ground-water flow systems in various geologic environments of Wisconsin will be investigated within the framework of their relation to waste disposal practices of selected industries and municipalities. Solid and liquid waste disposal sites of the canning, dairy, and paper-pulp mill industries, plus municipal sanitary land fill sites will be areas wherein shallow flow systems are to be investigated.

It is anticipated that limited site selection criteria for the specified disposal practices can be developed based on the hydrogeologic framework. Where liquid wastes are being disposed of through spray irrigation or ponding, formulas will be developed to control rotation of equipment used for the waste effluents. It is further anticipated that more extensive investigations can be initiated following this preliminary study.

Surface and subsurface geologic, hydrologic, and geophysical data are to be collected, compiled, and interpreted. Laboratory and field studies will be interpreted to provide a basis for practical application of results.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Wisconsin

5.1317, OPERATION AND EVALUATION OF A DEMONSTRATION ROTATING BIOLOGICAL CONTACTOR

F.M. WELCH, Allis Chalmers Mfg. Company, Milwaukee, Wisconsin

The purpose of the contract Allis-Chalmers now has with the F.W.P.C.A. is to design, construct, operate and evaluate an in-line (adjacent to an existing sewer) waste treatment device. The waste treatment device to be investigated is termed a Rotating Biological Contactor (R.B.C.) and will be utilized to treat combined sewage flows.

The R.B.C. system is a biological process which consists of fungi and bacteria that have grown on a series of rotating discs. The rotating discs act as a support media for the bio-mass and an aeration device. The proposed R.B.C. in-line system will treat both dry-weather and storm flows by subjecting said flows to screening, grinding, sedimentation and biological oxidation.

The contract will consist of three phases. Phase one will involve tests on a laboratory unit at which time design criteria will be obtained. The second phase will consist of constructing an actual field unit in the Milwaukee area. The third phase of the contract will be the actual operation and evaluation of the field unit.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1318, LUXURY METABOLIC STORAGE OF PHOSPHORUS IN THE ACTIVATED SLUDGE FLOC

S.K. MALHOTRA, Marquette University, School of Engineering, Milwaukee, Wisconsin 53233

The relative ineffectiveness of the activated sludge waste water treatment process in removing phosphorus is a major cause of progressive fertilization of natural bodies of water receiving treated waste waters. Phosphorus enrichment often results in algal blooms, which frequently result in objectionable odors and many other deteriorating effects on the quality of water.

Recently it has been reported that the activated sludge process can be adapted to make the organisms store phosphorus during their endogenous respiration phase, far in excess of their metabolic uptake in the logarithmic growth and declining growth phases. This excess phosphorus uptake, 'Luxury Storage,' has also been reported to be affected by the cations in the environment.

The objectives are to examine the storage of phosphorus in the activated sludge flocs as the microorganisms pass through different growth phases, and to determine the proportions of the total stored phosphorus in each of the growth phases; the effects of ionic and surface adsorption and storage of phosphorus by cationic colloidal formations.

Batch processes with a synthetic substrate under controlled parameters of pH, food/microorganisms ratio, cationic concentrations, dissolved oxygen concentrations and the degree of mixing will be employed.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Marquette University

5.1319, EUTROPHIC EVALUATION OF A SMALL MULTI-LAND USE WATERSHED

A.E. ZANONI, Marquette University, School of Engineering, Milwaukee, Wisconsin 53233

The proposed project involves the determination of the quantities of nitrogen and phosphorus which originate from various land use activities in a small river watershed tributary to Lake Michigan in the Milwaukee metropolitan area. The watershed in question is the Menomonee River watershed which includes agricultural, residential, industrial, commercial, park and recreation, woodlands and wetlands, and governmental-institutional land uses, and yet encompasses a drainage area of only 135 square miles. Based on the results of preliminary surveys, sampling locations will be located at critical points along the river for discharge measurements and nitrogen and phosphorus analyses. These data will then be used to estimate the nutrient quantities from the various sources in the watershed. The data will also be correlated with hydrological and climatological data to establish the manner in which these watershed factors might influence nutrient quantities from the various sources.

5.1320, EFFECT OF TEMPERATURE AND RELATIVE HUMIDITY ON C. BOTULINUM SPORE SURVIVAL IN WHITEFISH CHUBS DURING SMOKE PROCESSING

P.J. PACE, Milwaukee Department of Health, Milwaukee, Wisconsin 53202

A need to provide smoked fish processors with methodology to eliminate *Clostridium botulinum* from fish continues to exist. Recent investigations at this and other laboratories indicate that heat (82.2 degrees C for 30 min.) alone does not free fish of experimentally introduced *C. botulinum* type E spores. Experiments, at this laboratory, in which internal temperature of the fish and relative humidity of the kiln are simultaneously controlled have been encouraging. Thus far studies have been conducted with spores prepared from a single type E strain isolated from smoked whitefish chubs. Experiments are to be extended employing combined spore suspensions prepared from 50 type E isolates obtained from raw and smoked fish. Two non-proteolytic type B isolates, obtained from fish, also will be employed. Corollary studies, employing spores prepared from proteolytic types A and B *C. botulinum* strains and a type E strain, of known high heat resistance, also will be conducted.

5.1322, A MATHEMATICAL MODEL FOR THE FINAL CLARIFIER OF AN ACTIVATED SLUDGE PROCESS W.J. KATZ, Rex Chainbelt Incorporated, Milwaukee, Wisconsin 53214 (14-12-194)

Develop a mathematical model expressed in computer format which will enable the prediction, with a high degree of reliability, the quantity and quality of the effluent and underflow of a final clarifier in an activated sludge treatment system as a function of the mixed liquor flow rate and characteristics.

The subsidence characteristics of activated sludge relates to the clarification and thickening properties of the sludge. Measurements such as sedimentation rates, suspended solids concentration, volatile suspended solids concentration, zeta potential, etc. are required to identify the performance of the clarifier. The relationship of these basic parameters and other variables with respect to the performance of the final clarifier is what the mathematical model must express. It is the objective of this proposal project to measure and evaluate those parameters which have interrelationships to each other that influence the operational performance of the clarifier, and to relate them, if possible, in terms or parameters which are normally available to the consulting engineer concerned with the basic design of the final clarifier.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

5.1323, ECOLOGICAL STUDIES OF THE SURFACE WATERS OF THE WHITEWATER CREEK WATERSHED, WALWORTH, ROCK, AND JEFFERSON COUNTIES, WISCONSIN

S.G. SMITH, Wisc. State University, Graduate School, White-water, Wisconsin 53190

Distribution and relative abundance of selected plants and animals will be correlated with physical and chemical features of the surface waters of the Whitewater Creek watershed. Although primary emphasis will be placed on the streams, preliminary studies will be made of the lakes which have been formed by the damming of the streams. Detailed studies will be primarily concerned with vascular plants, fishes and selected algae. Although the primary objective of the project is to initiate a long-range interdisciplinary research program, certain specific problems will also be investigated, i.e. 1) the movements of selected species of fish within the stream system, and 2) the genecology of hybridizing or otherwise genetically variable populations of the round-stemmed bulrushes (*Scirpus* spp.) and possibly *Potamogeton* in relation to habitat disturbance and other ecological factors. Organisms studied will be evaluated as to their usefulness as indicators of water quality and other environmental conditions.

5.1324, POLLUTANTS IN PRODUCT AND PROCESS WATERS FROM OIL-SHALE RETORTING OPERATIONS AND METHODS FOR THEIR REMOVAL

S.S. TIHEN, U.S. Dept. of Interior, Petroleum Research Ctr., Laramie, Wyoming

This project is directed toward the determination of organic and inorganic pollutants in process and product waters from and oil-shale processing operation in order to devise methods for removing the contaminants or reducing their concentrations to harmless levels.

Because Green River oil shale deposits are located in arid or semiarid regions, process water will be scarce and provisions must be made for its reuse. It would also be desirable to augment existing water supplies by reclaiming the water product during retorting. In either case, the pollutants must be either removed or reduced to such low concentrations as to render them harmless. Detailed knowledge of the compositions and amounts of pollutants may be removed or reduced to harmless or unobjectionable levels. Organic contaminants might be present in sufficient quantities to make recovering them economically attractive.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

5.1325, AERATION OF LAGOONS IN RIGOROUS CLIMATE AREAS

R.L. CHAMPLIN, Univ. of Wyoming, School of Engineering, Laramie, Wyoming 82071

Demonstration Grant: Two Parts. Part I. A water balance for the City of Laramie, Wyoming is being measured. This includes measuring all incoming flow (municipal, surface and ground water) and all outgoing flow (storm drainage, sewage flow, ground water and streams).

Part II. Aeration of a pilot lagoon is being investigated. Due to the rigorous climate, treatment of sewage by the lagoon system is inadequate during much of the year. The parameters being investigated are: amount of air, loading and detention time, and temperature effects. The effects of present treatment on the Laramie River is being monitored.

5.1326, DEGRADATION - DEPLETION OF HERBICIDES IN IRRIGATION WATER AND ACCUMULATION OF HERBICIDE RESIDUES IN CROPS FROM TREATED WATER

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: (a) To develop sensitive quantitative methods for laboratory determination of selected aquatic or ditchbank weed herbicides and their degradation products or metabolites, including methods of extraction from plants, water and soil, and deterioration of samples before analysis. (b) To determine quantitatively the movement and accumulation of herbicides and their degradation products in water, soil, and crops on field plots irrigated with water containing herbicides. (c) To follow quantitatively degradation, depletion, dilution, sorption, and uptake of herbicides by water, suspended sediments, substrata and aquatic biota in irrigation canals.

Plan of work: During the first year, studies will be with acrylaldehyde: 2-propenal (acrolein) and, to a lesser extent, with copper sulfate. The second year studies are tentatively planned with 2,4-dichlorophenoxyacetic acid (2,4-D) and 2-(2,4,5-trichlorophenoxy) propionic acid (silvex) and the third year studies with 6,7 dihydrodipyrdo (1,2-a:2',1'-c) pyrazidinium salt (diquat) and xylene. The second and third year choices of herbicides are subject to later review after early results in the research program. Some procedures and techniques may be revised as experience and results show changes to be desirable.

5.1327, FATE OF HERBICIDES IN WATER AND CROPS IRRIGATED WITH WATER CONTAINING HERBICIDES

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: To determine: (1) the degree to which certain herbicides commonly used for aquatic and bank weed control are retained and assimilated in edible parts of irrigated crops; (2) differences between crops in assimilation of herbicides; and (3) degree to which herbicides applied in irrigation water under field conditions are retained in the edible tissues of certain crops.

Plan of Work: Seven herbicides to be used include: 2,4-D, silvex, amitrole, dalapon, dichlobenil, diuron, and simazine. Seven crops will be considered including potatoes, carrots, onions, tomatoes, romaine lettuce, soybeans and milo. Irrigation water containing two concentrations of test herbicide will be applied to each crop at two stages of growth. Water will be applied on the surface and by overhead sprinkling. Samples of edible parts of each crop will be taken after each irrigation and analyzed to determine amounts of herbicide, toxic metabolites or degradation compounds. If deemed desirable, samples of treated water and irrigated soil will be analyzed. Samples of crops on field plots, irrigated with water containing different amounts of amitrole, will be analyzed.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5.1328, CONTROLLING WEEDS ON DITCHBANKS AND OTHER NONCROP AREAS

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: In noncrop land to (a) develop improved chemicals and procedures to control or suppress plant growth, (b) establish the relations of climate, time and rate of treatment, and fertility, structure, and texture of soil to herbicide phytotoxicity and persistence in soil, (c) determine the effects of chemical, mechanical, and biological control treatments on the succession of plants, on soil erosion, and on other aspects of vegetation and soil management.

Plan of work: Herbicides will be applied along ditchbanks, fencelines, roadsides, and similar areas. Retreatments and observations will be made over a period of years to determine responses to different treatments and combinations. Indicator crops will be used to determine the length of time that phytotoxic concentrations remain in the soil. Mixture of desirable low-growing grasses or other plants will be seeded at various intervals following herbicidal treatments to determine which species of plants and time of seeding are most suitable for establishing a desirable vegetative cover on various noncrop areas following elimination or reduction of the stand of weed species by different effective herbicides. Results from similar experiments in different areas with different climatic and other environmental conditions will be correlated to discover general trends and basic principles.

5.1329, PRINCIPLES AND PRACTICES FOR THE CONTROL OF SUBMERSED, FLOATING, AND IMMERSED AQUATIC WEEDS

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: To investigate the herbicidal properties of new chemicals that show promising photocidal activity on aquatic weeds including techniques for evaluation; effectiveness and optimum time, rate, and method of application under various climatic conditions; the influence of water movement, temperature, turbidity, pH, and hardness; effect of texture and fertility of bottom soils on effectiveness; and biological control.

Plan of work: Promising chemicals will be evaluated in greenhouses and growth pools on submersed, floating and emerged species, and on emerged species in static water, flowing water, and soil-applied tests. Herbicides showing promise in greenhouses and pools will be further evaluated in canals, ponds, lakes, etc. to find the best application methods for each herbicide on all important species. The rapidity and extent of plant kill, increase in water-flow and reduction of water level in canals, and duration will be observed. Water temperature, turbidity, pH, total salt content, specific gravity of chemical, emulsifier, etc. will be correlated with herbicide effects. Surfactants and other spray additives, type of carrier, spray volume, size and type of granules, and application method will be related to herbicidal effects. Techniques for biological control studies will be developed.

5.1330, PERSISTENCE AND FATE OF HERBICIDES IN WATER AND AQUATIC SOILS AND THE EFFECTS OF HERBICIDES IN IRRIGATION WATER ON CROP PLANTS

F.L. TIMMONS, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Object: To determine herbicide persistence in waters and soils of treated canals, ponds and lakes; effects of temperature, pH, salt and silt content, light penetration, soil properties, etc. on dissipation of herbicides in aquatic soils; effects on crops of herbicides in irrigation water; and occurrence and concentration of herbicides in crops irrigated with such water.

Plan of work: Water samples will be taken after herbicide applications in canals, ponds, and lakes and downstream from points

of application in canals or impounded water, and the persistence of each herbicide in water and rate of dilution and disappearance determined. Similarly bottom soil samples will be taken from aquatic situations after herbicidal applications and analyzed. Determination will be made of the effect of various climatic, water quality, and soil property factors on persistence and fate of herbicides in water and aquatic soils. Herbicides will be introduced in irrigation water at selected concentrations and representative crops irrigated to find the relation of stage of growth of crop, method of irrigation, soil texture and fertility, etc. to the effects of herbicides on the yield and quality of crops.

6. WATER RESOURCES PLANNING

Techniques of Planning; Evaluation Process; Cost Allocation, CostSharing, Pricing, and Repayment; Water Demand; Water Law; Institutional Problems; Non-structural Alternatives; Ecologic Impact of Water Development.

6.0001, ECOLOGY OF SOME WADING BIRD POPULATIONS AFFECTED BY THE INVASION OF THE CATTLE EGRET INTO ALABAMA

J.L. DUSI, Auburn University, School of Agriculture, Auburn, Alabama 36830

Wading birds have a considerable impact upon their aquatic habitat because they are large birds. They add much to the aesthetic values of any water area. Since by their adaptations these birds are an integral part of the communities of our water resources, understanding of the ecology of this group of birds is important in the wise use of our water resources. Studies to be done include: 1. Using the new probe of radio telemetry, track Cattle Egrets and the native species to determine: daily movements; the zone of influence of each species; and their migration. 2. Study population trends by aerial reconnaissance along established transect lines, to secure population density, distribution, and establishment or abandonment of colony areas. 3. Determine behavioral-ecology of the Cattle Egret and its direct impact on the native species in the colonies, using observations supported by photographs and recorded vocalizations. 4. Continue studies on growth rate of the young, food habits, nesting success, parasitism, and others.

6.0002, ENGINEERING DESIGN CRITERIA FOR SOIL AND WATER MANAGEMENT

J.G. HENDRICK, Auburn University, Agricultural Experiment Sta., Auburn, Alabama 36830

OBJECTIVES: 1. Develop improved design criteria and techniques for the construction and maintenance of terraces, waterways, and other erosion control methods which will be compatible with mechanized farming using 4-row and larger equipment. 2. Establish design limits for row lengths, turn strips, point rows and row curvatures for improved operating efficiency consistent with good soil and water management practices for 4-row and larger equipment.

Develop design criteria and techniques for construction and maintenance of terraces, waterways, and other erosion control methods compatible with field operations using 4-row and larger equipment. Existing recommendations of terrace interval channel cross-section, and gradient variations will be followed unless modification of such recommendations appears practicable. Erosion control techniques other than terraces will be investigated.

Develop design criteria for field waterways. Equipment length, overhangs, wheel bases, and clearances will be measured and channel cross-sections designed that may be crossed by modern field equipment.

Establish design limits for row lengths, turn strips and row curvatures for improved operating efficiency consistent with good soil and water management practice for 4-row and larger equipment.

6.0003, PHYSICAL AND CHEMICAL PROPERTIES OF ALABAMA WATERS LIKELY TO SUPPORT STRIPED BASS, *MOXOSTOMA SAXATILIS*

E.W. SHELL, Auburn University, Graduate School, Auburn, Alabama 36830

Objectives: To determine if adult striped bass are present in river systems emptying into estuarine waters of Alabama, and if present, determine if reproduction of the striped bass occurs in these waters, and to determine the physical and chemical properties of these waters.

Procedures: Conservation Officers, commercial and sports fishermen and other individuals residing near areas where striped bass were once known to be present will be contacted to obtain information about the past and present status of the striped bass in local waters.

Physical and chemical properties of the waters will be analyzed to determine the most likely areas best suited for survival and reproduction of striped bass and to locate areas where striped bass fingerlings might be stocked for best results in attempting to re establish runs of the species.

Creel census or interviews with fishermen will be made and sampling of streams with rotenone and by seining will be done in certain areas to determine the presence and abundance of striped bass and to determine if spawning of striped bass occurs in the waters studied.

6.0004, SOME LEGAL ASPECTS OF WATER RESOURCE USE WITH RESPECT TO ECONOMIC DEVELOPMENT IN ALABAMA

D.R. STREET, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

The purpose of this study is to examine the socio-economic phases of water resource use in economic development, stressing the legal aspects with implications for the present and future. Specific objectives of the study are: A. To isolate socio-economic problems existing in the State of Alabama which are the result of inadequacies in present water use laws; and B. To illustrate possible solutions to problems of water use, and model legislative proposals, with their implications on economic development in Alabama in the future.

6.0005, PINK SALMON INVESTIGATIONS - FRESH-WATER ECOLOGY

W.R. HEARD, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Total freshwater mortality of pink salmon (*Oncorhynchus gorbuscha*) has been measured in Sashin Creek since 1940. For the average brood year, only 6 percent of the total eggs potentially available for deposition produce fry migrating to the estuary, but survival may vary between 0.2 and 23 percent. Since 1943, odd year runs have consistently produced a greater magnitude of spawners and higher freshwater survival than even year runs. Most mortality occurs between the time of egg deposition and fry emergence.

One of the goals of this research is to identify the factors causing mortality in spawning beds, determining which are density dependent and which are non-density dependent. Environmental factors including water flow and temperature, dissolved oxygen supply, gravel composition, permeability of the stream-bed, rates of oxygen removal due to decomposing organic matter and the mechanics and kinetics of spawningbed siltation, are studied in relation to mortality rates. Biological factors, including density, temporal and spatial distribution, fecundity and size of spawning adults are also measured in Sashin Creek and related to mortality rate.

Four experimental spawning channels in nearby Lovers Cove Creek provide similar natural environments where spawner density is controlled. Factors studied here, as related to spawner density, include distribution and other behavior patterns on the spawning beds, efficiency of egg deposition, egg retention and total freshwater mortality.

6.0006, AUKE LAKE STUDIES

W.A. SMOKER, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The many small lakes tributary to the Gulf of Alaska, together with their outlet streams and watersheds, serve as spawning and rearing areas for a significant proportion of the salmon runs in this region of Alaska. Despite their importance, little is presently known concerning the limnology, ecology, and productive capacity of these small lakes. Auke Lake was selected in 1962 as the site of a long range research program designed to delineate and investigate the physical, chemical and biological dynamics of such a small lake.

Physical and chemical parameters of the lake system and temporal changes in these parameters are being determined. The standing crop of phytoplankton is monitored by the analysis of chlorophyll pigmentation, and primary production levels are established by the carbon-14 technique. The dynamics of the major salmon species, *Oncorhynchus norka*, is followed with the limnological program. Adult and juvenile salmon and associated fish species are studied to establish survival rates, age and growth patterns, and food habits.

Objectives are: (1) accurate determination of numbers, age composition, condition, and biomass of salmon and interrelated fish in the system and their variability with time; (2) establish the importance of various physical, chemical, and biological factors in the salmon environment and assess their variability with time; and (3) investigate possible correlations between variations in salmon numbers and biomass and variations in environmental factors.

6.0007, WATER QUALITY REQUIREMENTS IN ALASKA CAMPGROUNDS WITH PROJECTIONS OF RECREATION DEMANDS AND BENEFIT/COST ANALYSIS FOR SITE SELECTION

R.S. MURPHY, Univ. of Alaska, Graduate School, College, Alaska 99735

Alaska's outdoor recreation resources represent a major income producing sector of the State. To a large extent its further growth appears restricted by insufficient and inadequate campgrounds. Existing camping facilities have not been examined thoroughly in terms of water quality problems, and the role of water in benefit/cost analysis in evaluating recreation in Alaska barely has been touched. The product of the study would provide important information which would aid directly in the programming of new recreation sites.

6.0009, INVESTIGATION OF SPAWNING GROUND POTENTIALS AND GROWTH AND SURVIVAL OF JUVENILE SOCKEYE SALMON IN FRAZER LAKE SYSTEM W.R. MEEHAN, State Dept. of Fish & Game, Juneau, Alaska

The objectives of this phase of the project are:

- 1) To evaluate spawning ground potentials of Frazer Lake in terms of quantity and quality of available gravel.
- 2) To determine present utilization of spawning areas by tagging upstream-migrant sockeye adults at Dog Salmon weir, and observing their distribution on spawning tributaries of Frazer Lake.
- 3) To enumerate and sample downstream-migrant sockeye salmon to obtain data regarding age, size and timing of smolts in the system.
- 4) To obtain preliminary limnological information concerning productivity of the lake itself, in terms of physical characteristics and plankton abundance and distribution.

A weir will be installed in the Dog Salmon River (outlet of Frazer Lake) in early May 1965. Smolt sampling and enumeration will continue until the migration ceases.

Adult spawners will be enumerated and tagged as they enter the system, from early June through their migration, and spawning ground surveys will be made during July and August of 1965 to determine utilization of spawning areas and related factors.

6.0010, THE DEMAND FOR MUNICIPAL WATER IN CENTRAL ARIZONA M.T. FARRIS, Arizona State University, Graduate School, Tempe, Arizona 85281

The quantity demanded as related to the price of municipal water used in Central Arizona is a pivotal factor in the economic feasibility of any proposal for the development of additional water sources for the area. One plan, the Central Arizona Project proposal, assumes water sales to municipal and industrial users at \$50 an acre-foot with 312,000 acre-foot of potential sales.

Little is known about the demand for domestic water in Arizona. Some rough estimates of future demand for domestic water can be gained by ascertaining the relationship between water use and the principal factors influencing its price, income and population in the service area.

Cross-sectional and time-series data will be obtained by field survey of municipalities in the study area. This data will be analyzed by statistical procedures to derive estimated relationships between per capita consumption, price, and income. This relationship can then be used in conjunction with population projection to estimate the range of probable water consumption for the study area.

6.0011, ECONOMIC IMPLICATIONS OF WATER POLICY IN ARIZONA M.M. KELSO, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

The hypothesis under investigation is that the content of water policy affects aggregate economic efficiency with which water resources are developed and used and, possibly, the distribution of income resulting therefrom.

The test of this hypothesis will be undertaken by examining existing water law and water-managing organizations in Arizona to determine whether and how they constrain contemporary decision making by water-using 'firms' as to water development, use and transfer. It will be presumed that present water development, use and transfer are the result, in part, of contemporary constraints on water-using firms found in present water policy.

Further test of the hypothesis will involve synthesizing an array of seemingly practicable changes in water policy and testing the constraints peculiar to each by programming them into economic models of the water-using firms. This will determine whether such modifications in water policy might, in fact, increase the magnitude of economic rent produced by the aggregate water input and whether such increases, if any, will be accompanied by changes in the distribution of that return.

6.0012, THE ECONOMICS OF WATER TRANSFER - AN APPRAISAL OF INSTITUTIONS M.M. KELSO, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: Under conditions of security and flexibility of water rights and of competition among water uses peculiar to Arizona: 1. To appraise the legal-institutional-administrative devices and processes through which transfers of water between uses and users take place and 2. To assess the consequences of these devices and processes on the economic efficiency and equity of water use and 3. To suggest desirable modifications in these devices and processes that might enhance economic efficiency or equity in the use of water resource.

DESCRIPTION OF WORK: The general approach will be to describe the functional structure of the selected water right complex vis-a-vis the marginal value product of water use in each category of use in each area; to determine the effects on the marginal value product of water that result from varying the relevant water right complex among categories of uses in each area; relevant hypothetical modifications of the institutional restraints will be analyzed to determine their probable effects on the marginal value product of water use; to appraise the results from such alternative modifications against the criterion of maximized marginal value product to water use; to assess the relative attainability of each of the programmed alternatives by examining the attitudes and values of affected persons toward such possible institutional changes; to conclude as to the hypothetical ideal of efficiency and the political ideal of attainability relative to each of the programmed modifications.

6.0013, WATER IN RELATION TO ECONOMIC GROWTH IN AN ARID ENVIRONMENT M.M. KELSO, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

Only about one-third of the approximately four and one-half million acre-feet of groundwater pumped annually in Arizona is replaced by natural recharge. The resulting overdraft of some three million acre feet per year is lowering the water table at an estimated average rate of six feet per year. As a consequence, costs of recovering groundwater are increasing. It is expected that changes in farm organization, output level, size of operation and resource demands will result. Changes are also expected in the rest of the economy, particularly in those sectors processing agricultural commodities and supplying inputs to the agricultural sectors.

Objectives - 1. Predict the impacts of declining water table on the organization, output and resource use in the irrigated crop sector in Arizona. 2. Predict the impact of changes in agricultural production and resource demand on other sectors of the economy.

Procedures - 1. Mathematical programming models designed to predict effects of increasing costs of water on output, organization and resource demand of typical farm situations in the irrigated agriculture sector are being developed. The programming models will be linked with an electrical analog model of the groundwater system. 2. An interindustry model of the Arizona economy has been developed which comprises 26 endogenous sectors and seven exogenous sectors. 3. The effects of changing conditions of water supply over time on the growth and development of any sector of the state's economy can then be predicted by 'plugging in' the predictions of the programming models into the interindustry model.

6.0015, OPERATIONS RESEARCH STUDY OF WATER RESOURCES DEVELOPMENT AND MANAGEMENT IN THE TUCSON AREA

C.C. KISIEL, Univ. of Arizona, Graduate School, Tucson, Arizona 85721

The general objective of the project is to undertake a preliminary application of the methodology of operations research to water resources development and management in Tucson area. Implicit in the objective are: (1) an analysis of existing data collection systems in the face of future planning responsibilities, (2) establishment of quantitative objective functions and their constraints, and (3) establishment of design criteria, formulation of a set of feasible alternative designs, and determination of the optimal design(s) through mathematical programming and simulation techniques. Ultimately, an optimal dynamic plan(s) would be recommended for the conjunctive development and management of ground and surface water resources within and without the region. The methodology may prove useful for similar studies in other arid-land regions.

6.0016, LIFE HISTORY OF LONGEAR SUNFISH

R.L. BOYER, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

Due to their feeding habits and abundance in Beaver and Bull Shoals Reservoirs, the longear sunfish assumes a place of importance.

The objective of this study is to obtain information basic to a more thorough understanding of the behavior of longear sunfish in reservoirs.

Using SCUBA, direct observations are made underwater, sometimes being recorded on film for later analyses. Seasonal and diurnal behaviors are followed and environmental factors are monitored. Barrel trapping studies are carried out to determine the extent of horizontal and vertical movement. Collections are made for determinations of seasonal gonadal body weight ratios, the number of eggs spawned per nest, seasonal changes in ova diameters, and the size, age, and food habits of spawning fish.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0017, MOVEMENTS OF SPORT FISHES IN BEAVER RESERVOIR

T.O. DUNCAN, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

The objective of this research is to determine the movements of several important reservoir sport fish species and the contribution of populations from various life zones of Beaver Reservoir to the upper reservoir spring fishery. White bass will be the most numerous fish studied and others will include walleye, northern pike, channel catfish, blue catfish and flathead catfish. The fac-

tors which influence the spring migrations and other movements shall be investigated.

Trapnets will be used to capture large quantities of fish in fall, winter, and early spring for tagging. Electrofishing devices shall be used in shallow upstream spawning areas to capture these species for tagging purposes and to recover previously tagged fish. Fishermen returns are expected to supplement recaptures by gill-netting, etc.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0018, DEVELOPMENT OF IDENTIFICATION KEYS TO LARVAL AND JUVENILE RESERVOIR FISHES

T.O. DUNCAN, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

Work units at this Investigation are being revised to determine the best methods of measuring survival of larvae, and environmental factors influencing their survival (or mortality). Photographic larval fish keys to the important species in the reservoirs under investigation are required.

The objective is to prepare a photographic key of reservoir fishes using modern photomacrographic techniques to prepare plates of major changes of body structure from hatching through known characteristic features of juveniles. To provide supplemental information on spawning and hatching periods, and other features of the development of reservoir fishes. Using fish specimens collected by electrofishing devices, strip and fertilize eggs, hatch and rear in laboratory experimental hatchery, preserve specimens daily and photograph. Use reflected and transmitted light, and stains to accentuate features desired in keys.

6.0019, POPULATION ESTIMATES FROM MIDWATER TRAWL SAMPLING

A. HOUSER, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

The technique of estimating the size of shad populations developed by Houser and Dunn (1967) through midwater trawl sampling has provided a new approach to the study of fish population dynamics in reservoirs. This method will be used to estimate the size of shad populations and for any other species occurring in the catch in sufficient numbers to permit computation. These samples will also provide data on recruitment, mortality, growth and distribution. A series of 60 nighttime hauls conducted during one week provides sufficient data for an estimate. Three estimates will be attempted annually in Bull Shoals and Beaver Reservoirs.

6.0020, COLLECTION AND COLLATION OF AVAILABLE BIOLOGICAL, PHYSICAL AND CHEMICAL DATA ON U. S. RESERVOIRS

R.M. JENKINS, U.S. Dept. of Interior, Natl. Reservoir Res. Prog., Fayetteville, Arkansas 72701

Extensive search and procurement of all pertinent physical, chemical and biological data on reservoirs from the literature and from the Branch River Basin Studies, BSWF, USGS, Bureau of Reclamation, Corps of Engineers, USPHS, TVA, Branch of Federal Aid, BSWF, and State fishery agencies.

Development of methods of storage and retrieval of large masses of data, and statistical analysis of interrelations between reservoir environmental conditions, biological productivity and sport fish production and harvest.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0021, EFFECTS OF ENVIRONMENTAL FACTORS ON STANDING CROP AND HARVEST OF FISHES IN U. S. RESERVOIRS

R.M. JENKINS, U.S. Dept. of Interior, Natl. Reservoir Res. Prog., Fayetteville, Arkansas 72701

Exploratory multivariate analysis has been completed on effects of nine environmental factors (reservoir area, mean depth,

6. WATER RESOURCES PLANNING

total dissolved solids, storage ratio, shore development, age, fluctuation, outlet depth and growing season) on fish standing crop and sport commercial harvest. In this new study, standing crop and harvest estimates on about 250 reservoirs will be subdivided by fish species (involving up to 80 species) in relation to environmental factors. Sport fish harvests will also be examined in relation to fishing pressure and success rate. Calculations will be performed on IBM 7040 computer, with programming by Dr. Dunn.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0022, EXPLORATORY SAMPLING PROGRAM FOR YOUNG-OF-THE-YEAR FISH

N.F. NETSCH, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

Background--The majority of the fish population dynamics studies on large impoundments are concerned with fish 1 year or more old. Research done by this and other agencies has shown that the most dynamic period in the life of at least some species is during their first year. The purpose of this work unit is to develop a population dynamics program for age-group 0 fish in the upper White River reservoirs.

The objectives are to: (1) develop sampling techniques for age group 0 fish suitable for the upper White River reservoirs; (2) determine gross distribution patterns for the major species; and (3) develop a population dynamics program for young fish.

The procedures to be followed are to: (1) obtain monthly samples from four areas on each study reservoir--major habitat types will be sampled in each area; (2) use gear which will include depth controlled tow nets up to 1/8 inch mesh, seines, rotenone samples, small mesh gill nets and electrofishing; (3) analyze data so that catch can be correlated with date, reservoir, area, habitat type and gear.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0023, SPOTTED BASS REPRODUCTION IN BULL SHOALS

L.E. VOGEL, U.S. Dept. of Interior, South Cen. Reservr. Invtgs., Fayetteville, Arkansas

The spotted bass is an important sport fish in Bull Shoals Reservoir and appears to have increased in abundance since impoundment. Little is known about reproductive requirements or their ability to compete with other black bass for preferred spawning habitat.

The objectives of this study will be to determine the habitat, substrate, water depth, temperature and other environmental requirements for successful reproduction, and to describe the spawning behavior in detail.

Observations underwater will utilize scuba and will include filming with an underwater movie camera to provide detailed analysis of spawning behavior. Nest contents will be enumerated at egg and larvae stages to determine hatching success.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0024, IMPOUNDMENT EFFECTS ON WATER QUALITY AS REFLECTED IN PARASITISM OF RESERVOIR BASSES

D.A. BECKER, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

The proposed study is the first pre-impoundment through early impoundment investigation of this nature to be conducted in the United States.

Field investigations will employ electrical shocking gear for the live collections of the black basses *Micropterus dolomieu* Lacepede, *M. punctulatus* (Rafinesque), and *M. salmoides* (Lacepede).

Basses will be examined in the laboratory for helminth and copepod parasites in an effort to follow the quantitative and qualitative dispersals and fluctuations of these parasites as the water quality is effected by the water level fluctuations from a river to a reservoir environment. Standard and total length, weight, and scale samples will be obtained to ascertain the effect of parasitism on the aging and growth rates of basses which may

help explain why sport fishing declines after several years in recently impounded reservoirs effecting the recreational economy of the municipalities surrounding reservoirs. Parasitism will be related to the whole food chain in an attempt to establish another parameter for water quality.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Arkansas

6.0025, LEGAL-ECONOMIC ASPECTS OF WATER USE IN ARKANSAS

H. ELLIS, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Overall objectives of this study are as follows: 1. To appraise the current status, and selected aspects of the historical development, of Arkansas laws regarding water use. 2. To evaluate such laws in light of existing and emerging or potential water use and development problems of farmers and others. 3. To evaluate alternative legislative or other remedial measures for coping with such problems.

DESCRIPTION OF WORK - Conduct study of (1) reported Arkansas Appellate Court decisions, statutory and constitutional provisions, and attorney general opinions regarding the use of the various water resources, surface and underground, natural or artificial, in the State; (2) relationship of water-rights and associated laws to the functions of districts or other local organizations; (3) actual administration and operation of selected statutes regarding water use. Evaluate (1) water-use laws in light of existing and emerging or potential water-use and development problems of farmers and others; (2) adequacy of existing water-use and associated laws; (3) alternative legislative or other remedial measures for coping with problems that appear in need of correction.

SUPPORTED BY U.S. Dept. of Agriculture Arkansas State Government

6.0026, GROUND WATER, RESOURCES AND RECHARGE - RICE

K. ENGLER, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Determine by use of a vertical well hydrologic conditions set up in recharge; effect of chemical compatibility and bacteriological contamination, if any amount, if any, of surface filtration and other treatments necessary for successful recharge using surface water; make estimates of cost of artificial recharge using results of project as a basis for these determinations; check depth-to-water in irrigation wells of the rice growing areas to determine water level trends and verify or disprove safe yield calculations previously made.

DESCRIPTION OF WORK - The annual depth-to-water measurements in approximately 275 rice irrigation wells was conducted in cooperation with the Federal Land-Bank of St. Louis and the United States Geological Survey. These wells were measured in the Grand Prairie Region and in the Northeast rice producing area. A 45 ft. sq. No.7 rock media filter was constructed and tested. The recharge well was redeveloped to a specific capacity of approximately 20 gal/per min. per ft. and one test was run to verify the effect of air in the recharge water. Considerable time was spent in preparation of reports.

6.0027, SEASONAL VARIATIONS IN THE PHYTOPLANKTON - BACTERIA POPULATIONS AND THE NUTRIENT CONCENTRATION IN BEAVER RESERVOIR

R.A. GEARHEART, Univ. of Arkansas, School of Engineering, Fayetteville, Arkansas 72701

The objectives of this research on Beaver Reservoir are: (1) to determine chemical nature and amounts of nitrogen and phosphorus; (2) to quantify and qualify the phytoplankton and bacterial population; and (3) to evaluate the relationship between the type and amount of nutrient and the phytoplankton-bacterial population. Determinations and analysis will be based on: (1)

monthly vertical samples at 20 foot intervals at three stations; (2) chemical and physical parameters; (3) enumeration and identification of phytoplankton samples and determination of physiologically groups of bacteria present; (4) analysis of type and amounts of nitrogen and phosphorus; and (5) correlation of plankton-bacterial population with nutrient concentration and chemical species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0028, WATER RESOURCES PLANNING STUDIES - ARKANSAS AND OKLAHOMA

L.R. HEIPLE, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

The proposed research will include a comprehensive planning study of the watercourses which flow between the states of Arkansas and Oklahoma. Included in these basin studies will be the quantity and quality of stream discharge at selected stations and the effect of proposed conservation storage on the quantity and quality parameters. A major purpose of this investigation will be to permit future allocation of this water resource between the two adjoining states. Previously collected field data will comprise the primary source of data for this study.

The investigative approach proposed is: 1. Investigative review of all water planning of all other agencies within the basin limits. 2. Preparation of flow duration curves for all basins using mean daily flow records ready for computer processing. 3. Make a review of established water quality data with additional evidence collected as required. 4. Determine the effect of proposed storage as required. 4. Determine the effect of proposed storage on stream flow duration curves and on water quality at each storage site.

6.0029, DISTRIBUTION AND GROWTH PATTERNS OF THE GIZZARD SHAD (*Dorosoma cepedianum*) AND THREADFIN SHAD (*Dorosoma petenense*) IN RESERVOIRS

R.V. KILAMBI, Univ. of Arkansas, Graduate School, Fayetteville, Arkansas 72701

The objectives of the research are: (1) to determine the abundance and distributional patterns of the young of the year gizzard and threadfin shad; and (2) to describe early growth history of the young shad. Analysis will be based on monthly samples from two reservoirs in main channel and cove areas, including information on unit of effort in collecting, estimates of relative abundance and seasonal fluctuations, length and weight data, and biotic and abiotic characteristics. Collections will be made by Bureau of Sport Fisheries and Wildlife, South Central Reservoir Investigations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

6.0030, EFFECTS OF WATER DIVERSION ON BIOTA AND WATER QUALITY IN THE STATE OF ARKANSAS

R.V. KILAMBI, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

The proposed study is to evaluate biological characteristics of fish in Arkansas Reservoirs and the King's River, the latter serving as an unaltered environment. The emphasis is on the population structure in relation to the environment with special reference to meristic and morphometric characters, age and sex composition, rate of growth, fecundity, and interaction between populations or species and their environment. Laboratory experiments will be planned to study the effects of temperature on hatching and survival of eggs, critical period in the development of eggs, and the fixation of the meristic characters.

It is also planned to tabulate and correlate plankton data with physical and chemical variants collected from five small Arkansas impoundments over a period of 28 years. Emphasis will be placed on seasonal cycles of plankton species characteristics of these environments, their possible use as indices of trophic levels, and the succession of species along with physical chemical change in two small artificial lakes over 28 years. Laboratory experiments will

be performed to determine effects of controlled physical and chemical factors on resident plankters and the results compared with field data.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Arkansas

6.0031, A STUDY OF PHYTOPLANKTON DYNAMICS IN LAKE FAYETTEVILLE AS A MEANS OF ASSESSING WATER QUALITY

R.L. MEYER, Univ. of Arkansas, Graduate School, Fayetteville, Arkansas 72701

The proposed research plan involves an investigation of the algae as primary producers in a lake typical to northwestern Arkansas, Lake Fayetteville. The investigation will include field and laboratory analysis of the chemical, physical and biological factors effecting algal biomass, primary productivity and algal succession.

Field investigations include observation on: 1. The abiotic and biotic factors effecting primary productivity in an intensively studied lake. 2. Samplings from similar lakes will be compared with base lake.

Laboratory investigation would employ isolated and cultured naturally occurring algal species: 1. To identify the parameters to which influence the presence or absence and growth rate. 2. To identify those factors which determine its life cycle.

Field and laboratory data would be correlated to determine which parameter are the most applicable in influencing primary productivity and water quality.

6.0034, UTILIZATION OF INSECT ENEMIES IN THE CONTROL OF INSECT PESTS AND WEEDS

L.A. ANDRES, U.S. Dept. of Agriculture, Albany, California

Object: To determine the basic relationships between weeds and weed-feeding insects and to effectively carry out all domestic phases of a program designed to use insects as biological agents to control weeds.

Plan of Work: Basic research is undertaken on interrelations between weeds and insects to determine factors of host plant selection and host specificity. When a program to control a weed is necessary, a thorough study of the weed is undertaken in the United States, its distribution is determined and the types of habitats it occupies.

Exploration for and preliminary studies on host specificity of insect enemies of aquatic weeds is undertaken at Castelar, Argentina and use is also made of information developed by P. L. 480

6. WATER RESOURCES PLANNING

grants. Species are selected as candidates for introduction, and material is shipped to the Entomology Research Division quarantine facility at Albany, California, where the final tests are conducted to determine that no useful plant will be attacked. After clearance has been obtained from appropriate State and Federal agencies, colonization of the insect begins. When the insect becomes established and builds up adequate colonies, redistribution of the insect to additional areas is carried on. As a rule, the redistribution program involves arranging cooperative programs with State and county organizations. Evaluation of the effectiveness of the insect as a control agent is conducted.

6.0035, SYSTEMATIC ANALYSIS OF MANAGEMENT EFFECTIVENESS OF THE WATER QUALITY CONTROL BOARD SYSTEM OF CALIFORNIA

J.A. HARMON, Engineering Science Inc., Arcadia, California
DOWD

This study is an evaluation of the actions of the California State Water Quality Control Board System to derive fundamentals of management practices that will be systematically catalogued and summarized in a form that can be adapted on a nationwide basis to the workings of other boards or agencies in the generic fields of water resources management of water quality control. Through an understanding of the mechanism of this board and its interrelationship to other elements of water resources management programs, and by development of criteria that can be utilized to measure the performance of such an agency, considerable knowledge will then have been gained that will be directly related to the management problems inherent in a total water resources program.

Detailed output from the study will be in the format of an analytic report of environmental factors affecting water quality management, a behavioral analysis of the functioning of an actual board, a decision process model representing the actions of an 'ideal' board, a set of standard problems consistent with the decision process model, and recommendations for decision-making techniques applicable to water management boards.

Current on-going research in water quality management appears to be generalized toward survey and analysis of large cross-sections of the management activity. This study will emphasize the systematic analysis of a water quality management agency's decision making processes. In this respect this study complements existing research work.

The study will be performed utilizing techniques of microdata analysis and computer printouts which symbolize actual board proceedings. From this, a model of an 'ideal' board will be developed.

6.0036, SOIL MOISTURE DRYING CURVES-MANAGEMENT RELATIONS

M.B. RHEA, Humboldt State College, Graduate School, Arcata, California 95521

Objective: The objective of this research is to determine the nature of the soil moisture depletion curves under varying vegetative cover types and under varying management practices in Humboldt County, California.

Work Proposed: Long range plans call for intensive sampling of soil moisture depletion on varying vegetative and soil types and under varying management practices.

The present proposal is directed at 1) bracketing the extremes expected by sampling depletion on ungrazed range land and on undisturbed upland redwood forest, and 2) on north and south aspects of recently-cut redwood lands.

6.0037, A SYSTEM APPROACH FOR INTEGRATING GROUNDWATER AND SURFACE-WATER USE

R.E. MITCHELL, Aerojet General Corporation, Azusa, California

This program will produce an analytical technique by which the most efficient utilization of water resources may be determined. The influence factors of potential surface supplies, quantity and quality needs of the users, waste-water treatment, groundwater pollution, community growth characteristics, economics, and legal/organizational needs will be included.

This research program is undertaken to present a systems approach to the preservation of the quality and quantity of the groundwater resource.

The research program will evaluate the projected needs of a typical expanding urban/rural community currently using groundwater supply and evaluate the steps to be taken to best provide the future water supply. The various sources of surface water and groundwater and their quality management will be considered. In addition, all the system constraints will be included so that a useful approach will be defined. To validate the approach, the study will be related to an existing groundwater problem area. The program will relate all the factors, both direct and indirect, to provide a master plan for this area.

6.0038, SAN PABLO BAY STUDY

F.A. NUDI, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

Objectives: To determine the effects on marine life caused by increased dredging and spoil disposal by the Army Corps of Engineers at pre-selected areas in San Pablo Bay in cooperation with U.S.B.S.F.W. River Basins.

Procedure: Monthly sampling will be made for the collection of water samples and marine organisms at five separate areas involving twelve station from Tiburon Peninsula to Carquinez Strait. Sampling areas include past, present and future dredged and spoiled areas as well as areas yet undisturbed. The type of sampling to be done will include trawling with a 15-foot otter trawl to determine the abundance and distribution of benthic swimming animals, bottom samples taken with a Birge-Ekman dredge to determine the types and abundance of smaller, more sedentary benthonic animals and water samples taken at surface and off-bottom to measure the temperature, and dissolved oxygen present.

6.0039, CONSUMER ATTITUDES TOWARD MINERAL TASTE IN DOMESTIC WATER

H.J. ONGERTH, State Dept. of Pub. Health, Berkeley, California 94704

The major specific aim of this research is to measure consumer attitudes toward mineral taste occurring in 30 carefully selected California water systems, and then to develop, by statistical procedures, the best fitting mathematical function which will describe the relationship between amount of mineral content in water and measured consumer attitudes. The function relationship, once developed, will allow limiting standards to be recommended for mineral content in domestic water. Recommending such standards on the basis of scientific data constitutes the general purpose of this research. The standards recommended will also represent an important step toward the attainment of long range goal of this type of research: the establishment of definitive limiting standards for mineral content in domestic water in order to fully ensure potability for daily consumption.

6.0040, LEGAL ASPECTS OF WATER RIGHTS IN THE WEST

W. HUTCHINS, U.S. Dept. of Agriculture, Berkeley, California

Objectives: To review, analyze, and compare the development and current status of the laws relating to water rights in the 19 western states. This includes the states lying west of or along the 100th meridian.

Approach: Analyses are made of the development and status of the statutes, constitutional provisions, and reported court decisions regarding water rights in each western state with respect to

6. WATER RESOURCES PLANNING

various sources of water. Significant comparisons are made among the applicable laws in the different states. Separate publications on the water rights laws of individual states have been or are being prepared as well as a comprehensive report covering all of the western states. It will include discussions of applicable state and Federal laws and interstate or international matters.

SUPPORTED BY U.S. Dept. of Agriculture

6.0041, GENESIS AND MORPHOLOGY OF PYGMY FOREST-BLACKLOCK SOIL ECOSYSTEM

H. JENNY, Univ. of California, Agricultural Experiment Sta., Berkeley, California 94720

In the regional redwood-Douglas fir forest of Mendocino County, there occur on ancient marine terraces pygmy forests of dwarfed pines and cypresses. They are confined to extremely leached and impoverished podsol soil with impenetrable iron hardpan layers. These sites are a challenge to the understanding of plant growth and soil fertility.

The work proposed will ascertain the role of the fluctuating water table by installing recording devices along the transition zone from pygmy to regional forest. On other sites, drainage systems will be installed to permanently lower the water table; hardpan layer will be broken up with jackhammers; soil acidity will be neutralized and fertilizer treatments will be initiated to build up the depleted nutrient level. Growth rates will be determined on natural and planted vegetation.

SUPPORTED BY California State Government

6.0042, PUBLIC ATTITUDES TOWARD REUSE OF RECLAIMED WATER

A.L. KNUTSON, Univ. of California, School of Public Health, Berkeley, California 94720

The research here proposed has three specific objectives: 1) to assess the attitudes, beliefs, and behaviors regarding reclaimed water expressed by respondents chosen from four selected California communities; 2) to examine relationships between measured attitudes toward reclaimed water and selected personal characteristics of respondents; and 3) to examine relationships between measured attitudes toward reclaimed water and general climatic conditions, abundance of fresh water supply, and the limited reuse of reclaimed water.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

6.0043, ECONOMIC GROWTH AND OPTIMUM WATER RESOURCE DEVELOPMENT

I.M. LEE, Univ. of California, Agricultural Experiment Sta., Berkeley, California 94720

The objective of this project is to develop criteria and quantitative procedures for analyzing the economics of water development and so to formulate them to make them useful for policy formulation and operation. The study will contribute to the knowledge of economic growth since it will consider methods of appraising alternative development programs for water in a setting of economic growth. It is expected that the methodological approaches considered will be applicable to the analysis of allocation and development problems of other resource than water.

An investigation will be made by study of a particular water development system of existing procedures for estimating resource demands in a dynamic economy and hypotheses formulated about the determinants of water demands and the relationships among them. A conceptual framework will be developed for quantitative analysis of development under conditions involving different rates and patterns of economic growth.

6.0044, ECONOMIC EVALUATION OF WATER - A DYNAMIC INTERREGIONAL INPUT-OUTPUT PROGRAMMING MODEL OF CALIFORNIA AND THE WESTERN STATES WATER ECONOMY

P.H. MCGAUHEY, Univ. of California, School of Engineering, Berkeley, California 94720

Part IV of this series of studies on the Economic Evaluation of Water involved the development of an 81 sector transactions table for the California economy from secondary data. The table was then aggregated to a 24 order model for which water withdrawal coefficients were derived. The model was cast in a linear programming format in which water availability constraints were varied. Resulting changes in the format in which water availability constraints were varied. Resulting changes in the value of the objective function, which was taken to be value added for the productive sectors, and the value of the dual solution were noted. A so-called 'time path' of the 'shadow price' of water was analyzed. The results will appear in 1968 in a report to the supporting agency by Dr. E.M. Lofting and entitled 'An Input-Output and Linear Programming Analysis of California Water Requirements.'

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

6.0045, ECONOMIC EVALUATION OF WATER, A DYNAMIC INTERREGIONAL INPUT-OUTPUT PROGRAMMING MODEL OF CALIFORNIA AND THE WESTERN STATES WATER ECONOMY

P.H. MCGAUHEY, Univ. of California, School of Engineering, Berkeley, California 94720

The work reported in Part V of this series of studies on Economic Evaluation of Water involves the development of multi-regional input-output table for the western states. For purposes of analysis a set of fifteen water use coefficients was estimated for each of the regions of the model and a western states' inter-regional 'water content' matrix was constructed. This matrix was then used in the development of interstate water dependency coefficients and water use multipliers. The determination of embodied water transfers among the states, as well as water-constrained projections are examined. A report authored by Dr. H. Craig Davis and entitled 'Multiregional Input-Output Techniques and Western Water Resources Development' has been submitted to the supporting agency.

6.0046, ECONOMIC EVALUATION OF WATER QUALITY

P.H. MCGAUHEY, Univ. of California, School of Engineering, Berkeley, California 94720

The general objectives of the research are to develop and demonstrate methods of utilizing modern computer techniques in water quality management problems presently unresolved for lack of a systems engineering approach. The specific objectives now nearing completion are to minimize the cost of achieving water quality goals by waste water treatment. For this purpose mathematical models have been developed, programmed for the computer, and applied to examples to illustrate their use. Ongoing work is directed to the development of waste water treatment coefficients by which to determine the limitations on economic growth, resulting from increased beneficial use of water, that are imposed by the associated cost of treating waste water at higher levels.

6.0047, THEORETICAL AND EMPIRICAL STUDIES OF STOCHASTIC MODELS FOR THE ANALYSIS OF FLOOD CONTROL AND RELIEF POLICIES

C.B. MCGUIRE, Univ. of California, Graduate School, Berkeley, California 94720

The purpose of the proposed research is to improve the methodology of designing flood control and flood relief systems. An economic, stochastic model of rational investment behavior in the face of floods now under development is briefly presented. This model which relates economic objectives, production technology, engineering and hydrological analysis and governmental planning, will be applied to a number of quite different alternative policies for flood control and flood relief. The proposed research would (a) explore the relationship of the model to the

6. WATER RESOURCES PLANNING

mathematical theory of reliability, optimal maintenance theory, and the theory of Markov processes, and explore the dynamic characteristics of the model, (b) subject the model to sensitivity analysis, (c) bring risk more explicitly into the model, (d) apply the model to inter-governmental flood-related programs, (e) improve the hydrological assumptions of the model, and (f) subject the model to empirical verification.

6.0048, NUCLIDE UPTAKE BY ALGAE AND ZOOPLANKTON

J.V. SLATER, Univ. of California, School of Public Health, Berkeley, California 94720

In the past few years studies of strontium and calcium accumulation by *Chlorella* cultures and by *Daphnia magna* have provided the basis for concluding that there are no food chain effects on the uptake, rate of uptake and equilibrium levels of calcium and strontium in these organisms. The only important factors are the concentrations of calcium and strontium in the water and growth rates of the organisms. The effect of other environmental variables on the accumulation of these elements by *Chlorella* and *Daphnia* is the main interest of present studies. Most of the studies are oriented toward biota-sediment interrelationships and how they affect water concentrations of isotopes.

For this purpose sediments are being collected from California and Nevada lakes and streams which differ widely in their calcium and magnesium concentrations and also in their total ionic concentrations. The sediments are dried and tagged with radioactive cations. For example, upper layer sediments from Lake Tahoe, which have very little in the way of inorganic dissolved nutrients, will be compared with the uptake patterns from sediments from Pyramid Lake in Nevada, which have very high and complex dissolved inorganic milieu. Preliminary results indicate that fish have an interesting feedback on the amount and rate of sediment-sorbed radioactivity released into the water and the feedback effect is dependent on the type of sediment.

6.0050, CALIFORNIA-ARIZONA ECONOMIC INTERDEPENDENCE AND THE COLORADO RIVER CONFLICT WITH PARTICULAR REFERENCE TO AGRICULTURE

H.O. CARTER, Univ. of California, School of Agriculture, Davis, California 95616

The current conflict between California and Arizona over the joint use of the Colorado River water has precipitated widespread discussion and speculation as to the probable effects on development and growth of the respective state economies. Specifically, information is needed to answer such questions as: What is the extent and nature of the dependence between agriculture in California and nonagriculture in California, agriculture in Arizona and even nonagriculture in Arizona? What are the technical water requirements of different sectors in California and Arizona and how are these requirements related with economic activity within California regions or between California

and Arizona? To what extent does the economic prosperity in each of these states depend on the use of the water from the Colorado River? Given this interdependency, and given the capacity of the Colorado River, how would the different states be affected by alternative schemes to allocate this water? While the proposed study covers only Northern California, Southern California, and Arizona, it is meant to be a pilot study conducted in such a manner that it will serve to indicate the problems of connecting state economies in an input-output framework.

We intend to develop an interregional input-output model for California and Arizona with the agricultural sectors spotlighted and examined in greatest detail. A transaction table for California (1958) by Carter is in the process of being completed. A similar table for Arizona (1958) by Martin is also in the processing stage. The proposed study will draw on and build upon this work. These two matrices will be combined with trade matrices into an interstate matrix capable of relating production in any sector to the activity level in all other sectors in the two-state economy.

6.0051, ON-FARM IRRIGATION WATER SUPPLIES AND COSTS IN RELATION TO CROPPING SYSTEMS AND PRODUCTION ADJUSTMENTS IN THE SACRAMENTO VALLEY

T.R. HEDGES, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

To complete study of irrigation water quantities and costs in the Sacramento Valley and choices enabling farmers to obtain maximum profits from land and other resources. Analysis for the Central rice-growing area is completed; this renewal will focus on general crops on the more fertile recent alluvial soils in the Southern Sacramento Valley. Rice, winter grains, safflower, and grain sorghums are the predominant alternatives on the basin soils. Dry edible beans, corn, and, for certain soils, alfalfa, and sugar beets also are adapted to the older alluvial soils, particularly those with well-drained surface soils. To the south, alfalfa, beans, sugar beets, and other irrigated summer crops dominate crop choices. Also, water supplies are limited, and relatively costly, compared with those in the rice areas. In both the rice and general crop areas, the analysis relies on linear programming and budgeting to evaluate alternative crops in various proportions, considering price relationships, marketing, marketing conditions, institutional forces, and other determinants, plus water supplies and costs. The study will yield quantitative criteria for farmers and others to use in allocating water and making profit-maximizing decision. These criteria will identify with specific soils according to characteristics that govern crop adaptation.

University of California

6.0052, EFFECTS OF ON-FARM IRRIGATION WATER SUPPLIES AND COSTS ON CROPPING SYSTEMS AND PRODUCTION ADJUSTMENTS

T.R. HEDGES, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Identify physical attributes of sources of water and of water distribution systems on farms to establish current cost structures, flexibility components, uncertainty elements, and long-term trends. Establish input-output relationships of adapted crops, within relevant output ranges. Establish criteria and analyses to guide choices for particular cropping systems and for evaluating opportunities for adjustment.

Description of Work: Fixed, variable, and total costs for modal sizes of wells and pumping plants in 16 San Joaquin Valley hydrographic areas have been determined from sample data. These data will be related to specific farm sizes and types according to analyses based on both primary (survey) and secondary data. Irrigation District structure, services, and water delivery costs also have been determined through published materials, questionnaires, and field visits. Amounts of water delivered to farmers, pricing policies and practices, and the cost structure, including fixed, variable, and total outlays per acre foot, according

6. WATER RESOURCES PLANNING

to water availability conditions, are being summarized by Irrigation Districts. We will use typical farm models and linear programming analysis to construct discrete demand functions for irrigation water and discrete supply functions for major crops under normative conditions. This analysis also will determine the marginal productivity of water and other resource inputs under alternative supply and price conditions; the point where individual crops will drop from the optimum farm organization, and determine price to be paid for water.

SUPPORTED BY California State Government

6.0053, IRRIGATION IN RELATION TO CROPPING SYSTEMS

T.R. HEDGES, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: 1. To identify the physical attributes of irrigation water sources in the Sacramento Valley and determine the physical and economic characteristics of supply schedules for irrigation water. 2. To establish physical input-output relationships for water and crop yields, the impact of project prices and input costs upon water allocations and optimum crop combinations for different crops under varying water quantities and costs. 3. To establish appropriate criteria and analytical guides for crop choices, cropping systems, and evaluating opportunities and limitations for profit-maximizing adjustments.

Procedures: 1. Hydrological, technical, price and cost, and farm survey data will be assembled to construct physical irrigation water supply schedules, cost schedules according to sources and fixed versus variable cost components, estimated measures for uncertainties and their impacts, and characteristics of water distribution systems. 2. Input-output relationships at various yield levels will be established for farm crops, and the impact of relative gross receipts, costs, and net returns under varying levels of availability and costs for water and other resources will be analyzed to determine compatibility of such crops in cropping systems. 3. Data from 1 and 2 will be analyzed jointly in relationship to each other and under varying assumptions for water sources, availability, and costs, type and cost for distribution systems, adequacy and costs for capital, price levels for inputs and products, and other physical and economic factors to determine optimum allocations for water, land, and other resources under varying sets of assumed conditions. Linear programming and budget analysis will be the primary tools used in these analyses; they will be applied to establish effective criteria and planning guides for optimum managerial decisions directed to profit maximization within the specified physical, institutional, and economic context for the Sacramento Valley.

6.0055, THE ECONOMICS OF WATER TRANSFER - AN APPRAISAL OF INSTITUTIONS

J.H. SNYDER, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

To identify and establish physical and economic characteristics of water sources and water distribution systems in order to evaluate costs, flexibility, and uncertainty components in production adjustments of vegetable producers in both short- and long-run situations in the Salinas Valley. To estimate short- and long-run demand and utilization of agricultural and nonagricultural water uses in the Salinas Valley. To identify and evaluate institutional forces that influence water use transfers within agriculture and between agricultural and nonagricultural water uses and users.

Collection, assembly, and analysis of primary and secondary data relating to vegetable crop production and water use and nonagricultural water use in the Salinas Valley. Various analytical techniques including linear programming, variate difference analysis, and Markov chain techniques will be used. Evaluation of institutional arrangements influencing water use and water use transfer in terms of criteria and strategies for management of the water resource. Case study method analysis of such institutions as the Monterey County Flood Control and Water Conservation District will be supplemented by regional input output analysis and may involve some river systems analysis.

6.0056, A COMPARATIVE STUDY OF THE USE TAX AS A MEANS OF ALLOCATION OF WATER RESOURCES IN A CONJUNCTIVE USE SYSTEM

L.F. WESCHLER, Univ. of California, Graduate School, Davis, California 95616

The primary purpose of this project is to examine the use tax as a means of permitting local water districts to secure rational allocation of ground and surface water supplies among competing users.

The California legislature has authorized eight public water districts to levy a use tax on the production of ground water. Four of these districts have actually applied this authorized power in attempting to regulate the relative consumption of ground and surface water within their respective boundaries. The comparative performance of the use tax systems utilized in the four districts will be tested on the basis of three sets of criteria: efficiency (devotion of water resources to their most valuable use), equity (distribution of benefits and costs), and progress (growth rate of the public water economy).

6.0057, STUDIES OF PHOTOSYNTHETIC HALOPHILES FROM OWENS LAKE

S. WITZ, Space General Corporation, El Monte, California

(U) Objective: a. Problem: The specific objective is to gain knowledge on the growth processes of the photosynthetic and sulfate-reducing microorganisms found in alkaline saline salt lakes. b. Application: The extrapolation of the efficacy of these environmental adaptations to the conditions prevalent on Mars. c. The physical and chemical characteristics of the saline environments will be determined with emphasis on water economy and energy requirements, and their effects on Halophiles.

(U) Approach: The specific environment selected for the proposed investigations is that of a 'triple layer' desert lake characterized by the presence of salt cakes precipitated from brines containing high concentrations of carbonates and sulfates. The proposed investigation of terrestrial brine organisms found in this lake should yield significant clues as to the biochemical and physiologic mechanisms that would permit growth of Martian life

6. WATER RESOURCES PLANNING

under conditions of extreme aridity and would allow its survival during periods of intense cold.

6.0059, A GENERALIZED, PROBABILISTIC APPROACH TO REGIONAL WATER SUPPLY ASSESSMENT

J.A. DRACUP, Environmental Dynamics Inc., Los Angeles, California 90048

This research is directed toward the development of a methodology to predict, for a region, a spectrum of available water supply levels including both ground-water and surface-water. This spectrum of available water supplies will be stipulated with probability confidence limits.

The work will be oriented toward determination of the probable regional water supply levels in regions where long-term precipitation records are available with only relatively short-term or no surface-water runoff records. Therefore, the research effort will be divided into three distinct parts:

1. Development of the system identification model of the non linear, time-dependent precipitation-runoff relationship.
2. Streamflow runoff records will be generated using long-term available precipitation records with the model developed in Part I.
3. Development of a probabilistic model which will stipulate levels of available water supply at certain confidence levels.

6.0060, THE LOCAL WATER DISTRICT AS AN URBAN WATER-POLICY DETERMINING ENTITY

W.W. CROUCH, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The municipal water district, in the area studied, is a special purpose government organized as result of local initiative. Most have been organized in response to a decision by the metropolitan water district to admit only municipal districts (not individual cities) into its membership. Such districts are usually composed of cities and unincorporated fringe areas. All are undergoing intensified urban development.

Of the districts studied, only two were not affiliated with the metropolitan water district. Both non-members were formed to develop and protect local water resources, but they have also looked to the state water plan for an alternative source of urban water.

Municipal water districts have been formed at the insistence of water-user groups, but the action requires approval of the general voters in a referendum. Land owners interested in suburban development and subdivision often have become concerned after the district has been formed. Districts, once formed, are governed by a board elected from district constituencies (instead of at-large). District operations are financed by taxes upon property and resale of water purchased from the metropolitan district's imported supply.

Few elections of board members were discovered to be contested. District government, after the initial formation referendum, tends to have relatively low visibility. Groups of

water users tend to influence district policy making. Voting of board members on agenda items tends to show very few divisions. In most instances, district policy is negotiated informally among water-users and related interest groups outside the formal framework of district organization and is ratified at board meetings. Two districts showed exceptional behavior. In one a division occurred over expansion of program; in the other the division was over proposed membership in the metropolitan district.

6.0061, THE MUNICIPALITY AS A WATER POLICY DETERMINING ENTITY

W.W. CROUCH, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

Eighty percent of the cities in the four counties studied which were incorporated prior to 1930 (the metropolitan water district was formed in 1928) organized municipal water storage and distribution systems. None of this group organized new systems after 1930. Although many cities have annexed territory actively they have expanded their water systems slowly, except where political demand arose as a result of conspicuously inadequate service from non-municipal systems. The State Public Utility Commission has played a vigorous role in determining service areas in the fringe sections where municipal annexation has been active, although it has no direct jurisdiction over cities.

Of the cities incorporated after 1930, only 18 percent organized a city water system. For the most part, this group has found no great demand being made upon the city to invest public funds in acquiring and integrating the local water systems.

Those cities studied which were members of the metropolitan district had almost no controversies over water distribution, rates, or adequacy of supply. No interest groups appeared to be actively engaged in making demands upon the city political system relative to water. Decisions were largely initiated by administrators and ratified by elected officials. Some complaints were raised about water quality (hardness or discoloration) but no organized efforts were made to change the situation.

The most clearly open political situation encountered in the study was in a city which had withdrawn from the metropolitan district and was attempting to supply needs from local (non-imported) resources. It had been split on four occasions by referendum votes in which local interest groups had polarized over specifically state water issues. On at least one occasion, the groups which normally dominated city policy-making were defeated by a coalition of groups (large low-income home owners who saw no advantage to themselves in expanding the city water system) which were normally not influential.

6.0062, SYSTEM IDENTIFICATION AND MULTI-LEVEL OPTIMIZATION OF INTEGRATED GROUND WATER SYSTEMS

J.A. DRACUP, Univ. of California, School of Engineering, Los Angeles - U.C.L.A., California 90024

Objectives: The principal objectives of this research effort is to investigate the feasibility of applying the mathematical techniques of system identification and multi-level optimization to a general model for integrated ground water aquifer systems.

System identification is described as follows: Given a mathematical model describing the behavior of the ground water regime, and given some observational data on that system, determine the transfer functions of the model such that the future response of the system can be predicted if the input to the system is specified.

Considering a ground water aquifer system, a mathematical model describes the hydrologic behavior of the system using observation data of production and basin level response. The transfer functions are determined from the physical characteristics of the basin. In multilevel optimization, the dependent ground water subsystems need to be uncoupled using pseudo-variables. The resulting second-level optimization results in a general model for optimal development and operation of integrated ground water basins.

6.0063, THE DEVELOPMENT OF WATER RESOURCES IN CALIFORNIA IN RELATIONSHIP TO PLANS AND PROGRAMS FOR WESTERN REGIONAL WATER DEVELOPMENT

E.A. ENGELBERT, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The State of California's water resources figure prominently in current proposals for western-wide water development and inter-basin transfers. Presently, no adequate picture is available concerning the forces, influences and conflicts which have shaped the California State Water Plan. In view of the plans which are being formulated in the West for inter-basin diversions, a study of the agreements that were reached in the formulation of the Plan and the arrangements which were established for implementing the Plan become increasingly important for further Federal and State decision making in the water resources field. This study will be conducted through examination of newspaper files, official documents and reports, and through interviews with major water leaders and participants in crucial decisions. The influence of political, economic, sectional, and other groups in determining specific features of the Plan will be examined. Hopefully, light would be cast upon group strategies for future water developments within the State and within the Western states region. The findings and conclusions would be available for use by officials of the State of California, the Secretary of Interior, and the Western States Water Council on Water Development in connection with their projected studies of inter-basin diversions.

6.0064, OPTIMIZATION OF WATER RESOURCES DEVELOPMENT--II

W.A. HALL, Univ. of California, School of Engineering, Los Angeles - U.C.L.A., California 90024

A comparative evaluation is to be made of the use, in water resources engineering, of 'critical period hydrologies' to develop optimum operating policies as contrasted to more sophisticated but more expensive analytical procedures. A preceding project has used a critical period of seven dry years (1928-1934), and decisions on firm outputs have been based on this. The decisions will be reexamined to evaluate the extent to which conclusions based on the critical period depart from those using other methods. The critical period procedure will be evaluated first on simple systems and then later applied to large integrated systems.

6.0065, DEVELOPMENT OF METHODS FOR PLANNING AND TIMING OF WATER RESOURCES INVESTMENTS

W.A. HALL, Univ. of California, Water Resources Center, Los Angeles - U.C.L.A., California 90024

Methods are being developed to determine the optimum staging policy for water resources development using operations research techniques. Costs of shortage or over-construction are included in the treatment, along with hydrologic risk. Particular emphasis is being placed upon the consequences of shortages on agricultural production, since this industry is expected to accept the first shortages in most multiple-purpose systems.

6.0066, HISTORY OF THE DEVELOPMENT OF THE WATER RESOURCES OF THE COLORADO RIVER-PHASE ONE. THE COLORADO RIVER COMPACT

N. HUNDLEY, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

This project represents the first phase of a larger study dealing with the historical development of the water resources of the Colorado River. This first phase will focus on the period from the late nineteenth century, when the first major attempts to develop the Colorado were made, through the passage of the Boulder

Canyon Act of 1928, when Congress took a landmark step in harnessing the river. Occurring between these events--and occupying a central position in this study--was the Colorado River Compact of 1922, which divided the waters of the Colorado between the upper and lower basins and which has figured prominently ever since in every important discussion concerning the river. The study will be based primarily upon official papers housed in the National Archives and in the archives of each basin state, private correspondence and manuscript holdings, interviews, solicited opinions, and the minutes of the Colorado River Commission. Because of the Colorado's important role in western development, the findings of this first phase should be of major interest to government officials, lawyers, political scientists, geographers, and historians. Indeed, the successes and failures met with by those involved in this early stage of river development should provide a useful case study for all those currently charged with national and state water resources development.

SUPPORTED BY University of California

6.0067, ALLOCATIVE IMPACTS OF FEDERAL AND STATE WATER DEVELOPMENT LAW

P.L. SHAPIRO, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The research studies the effects of water law on the allocation and development of water. The effects of water law have been noticed in the settlement patterns of agricultural land, in the allocation of water between urban and agricultural uses, in the division of water between in-stream and consumptive uses in addition to other allocational and development aspects. The research is positive, attempting to describe the legal impacts rather than attempting normative judgments. The economic forces leading up to the governmental intervention into the allocational process will be analyzed including any contributions of the legal process itself. The development statutes and their subsequent court construction will be studied in depth. An attempt will then be made to synthesize the legal and economic analyses in order to determine the allocational impacts, by way of the alterations of property rights involved. The specific area of inquiry is as follows: the Central Valley Project of the Bureau of Reclamation with particular reference to the Sacramento River Diverters case and public vs. private power controversy. This is intended as an initial effort, to be expanded later.

California State Government

6.0071, A STUDY OF THE BENTHIC FAUNA OF MERLE COLLINS RESERVOIR (VIRGINIA RANCH RESERVOIR)

R.R. RAWSTRON, State Dept. of Fish & Game, *Sacramento, California*

Objectives: To determine whether changes in species composition and production of benthic organisms is related to changes in fish yield, production, or both. Premises: Scandinavian workers have reported changes in the species composition of benthic fauna in impounded waters after the first year. These changes have a profound effect on the production of fishes. If the more herbivorous benthic forms are replaced by more predatory species, a less efficient energy transfer should occur.

Procedure: During the early years of the study we will examine the species composition and the relative abundance of the benthos of Merle Collins Reservoir. Efforts to obtain annual production estimates will also be made.

Samples will be taken monthly at three stations on different bottom types and depths. Samples from each station will be combined and subsamples drawn to reduce laboratory and analysis time. Identification will be made to the species level, if feasible.

California State Government

6.0072, DEVELOPMENT OF AN OPERATIONS CONTROL PLAN

A.R. GOLZE, State Dept. of Water Resources, *Sacramento, California*

This is an applied research program to study various concepts for instrumentation and control of large water storage, conveyance, and distribution systems, with emphasis on control by a real-time control computer

This research program utilizes a 300 cfs aqueduct system and consists of the instrumentation of approximately 21 facilities along the aqueduct, such as, at turnouts, pumping plants, and other hydraulic control and diversion structures, with an eight-channel medium speed (300-1000 hits/sec) digital PCM control and telemetry system. These 21 remote facilities will be connected by land line and/or microwave communication to two parallel control centers, one of which will have complete computer-control capability.

This control system will be operated for a minimum of two years. During this period data will be collected, analyzed, and evaluated; tests will be made of different concepts of aqueduct flow modification; control concepts will be tested; and control center procedures developed. Logic will be developed and programs prepared for computer control of the facilities for reporting operational status; and for compiling flow data for billing of water customers.

SUPPORTED BY California State Government

6.0073, HYDROLOGIC SIMULATION - DAILY STREAMFLOW

L.R. BEARD, U.S. Army, Engineer District, *Sacramento, California* 95814

Analysis of multipurpose reservoirs and reservoir systems indicates need for examining a great many ways that floods can occur in combination with antecedent streamflow sequences over a period of many months or years. The number of such combinations in a record of ordinary length is extremely small, consequently there is a great need in water resources studies for a method of generating synthetic floods in conjunction with monthly streamflow generation, and for a new approach to estimating magnitudes and frequencies of large flood events (only a few of which are observed in an ordinary streamflow record). Short-interval streamflow simulation is a promising approach to satisfying this need.

A report on Daily Streamflow Simulation is now being processed for release. Work will begin on a multi-station simulation model which will be for use on problems where more than one stream influences project operation.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0074, HYDROLOGIC SIMULATION - MONTHLY AND ANNUAL STREAMFLOW

L.R. BEARD, U.S. Army, Engineer District, *Sacramento, California* 95814

Accurately evaluating the amount and dependability of water supplies that can be developed from one or more streams has become increasingly important in connection with supplies for a wide variety of uses. Critical review of factors affecting the dependability of water supply forecasts indicates that a great element of uncertainty stems from traditional practice of presuming repetition of historic events in the future. Stream-flow simulation allows examination of many ways in which streamflows might occur for locations where data is sparse or abundant.

The basic monthly streamflow simulation model of the Hydrologic Engineering Center is being continuously developed and tested. Possible improvements to the model and associated computer programs, adding increased utility, have been investigated, these being the addition of a routine to estimate missing flows at a station or within a group of stations and the addition of a non-random start routine to permit use of the simulation technique as a predictor of future flows, given flows to the current time at a location or at several locations. Other interesting facets have also been pursued in trying to isolate a possible source of upward bias in the model. These include the determination of effect and desirability of smoothing of parameters such as mean, standard deviation, skewness, and correlation coefficients and the desirability of adjustment to the universe of the several statistics. New techniques of regression analysis are being employed in order to maximize the use of information in available data.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0075, OPTIMIZATION TECHNIQUES FOR HYDROLOGIC ENGINEERING

L.R. BEARD, U.S. Army, Engineer District, *Sacramento, California* 95814

Many problems too complex for direct solution have been solved by trial and error methods. Ingenious mathematical techniques and electronic computers have served to speed the solution of such problems, thus providing a tool for greatly reducing the cost and time of complex problem solutions. More important by far, it can make possible solutions of many hydrologic engineering and other water resources problems whose complexity has heretofore precluded even an approximate solution, ultimately saving construction costs and increasing project accomplishments.

A generalized optimization procedure has been developed in the Hydrologic Engineering Center, particularly in connection

6. WATER RESOURCES PLANNING

with the problem of deriving the best unit hydrograph and loss characteristics to reconstitute observed floods from observed rainfall. It has also been applied to the derivation of streamflow routing coefficients from observed hydrographs and to flood prediction. Tests of procedure have resulted in continued modification and improvements. More extensive applications will be made and other techniques will be developed with the view of ultimately applying the techniques to comprehensive reservoir system optimization. Application of such large problems can result in prohibitive electronic computer times and costs, so optimization efficiency will become the critical criterion for devising procedures.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0076, ARTIFICIAL FLOODS

L.R. BEARD, U.S. Army, Engineer District, *Sacramento, California* 95814

Regardless of cause, failure of a storage facility can result in downstream flooding of disastrous proportions. Timing and degree of flooding is extremely difficult to predict. In view of the increasing number of dams that have been constructed, expectancy and frequency of failure from natural and military causes might tend to increase. While considerable study of this phenomenon has been made under military programs, results of studies are not up-to-date and have not been adapted to modern computers.

Procedures developed for computing flood waves resulting from various types of dam breaching will be generalized and will be programmed for use in electronic computers. Computer program is to be designed for simplicity and flexibility of input so that it will be useful for actual predictions in a variety of circumstances, as well as for hypothetical studies.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0077, VALUE OF STREAMFLOW DATA

L.R. BEARD, U.S. Army, Engineer District, *Sacramento, California* 95814

Streamflow data are necessary for the design of economical and safe water resource systems. The adequacy of design is related, although not directly, to the amount of hydrologic data available in the area of concern. The purpose of this research project is to relate the cost of lost benefits (underdesign) and excessive construction costs (overdesign) to the length of streamflow record and other pertinent factors such as streamflow variability, availability of records at nearby stations, and inter-correlation coefficients.

This research project is a cooperative project between the U. S. Geological Survey and the Hydrologic Engineering Center. The U.S.G.S., as a data collection and research agency, is interested in how long stream-gaging stations need be operated to provide the optimum amount of information for design and construction decisions; therefore, must know the reliability of a design based on a given amount of recorded hydrologic information.

A pilot study was conducted during FY 1967 relating value of streamflow data at one particular location to length of record, assuming a highly simplified design use of the data. A report describing the results of this study has been prepared.

By a detailed analysis of streamflows for 4 stations having characteristics ranging from very stable to very erratic streamflows, generalized relations of design value of streamflow data to lengths of records at a project site and at nearby locations will be derived. These will be expressed in terms of project cost, since design value of data is a function of project cost.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0078, PLAN FORMULATION AND EVALUATION STUDIES - RECREATION DESIGN CRITERIA AND DEMAND

D.A. CRANE, U.S. Army, Engineer District, *Sacramento, California* 95814

Project will be accomplished essentially in the following three phases. Phase I - Refine and standardize essential recreational use data collected at existing projects through a pilot program with six other Districts with the objective to develop ADP

programs effecting cost savings and adequate analysis of recreational use data. Phase II - Establish acceptable procedures for use of such data in estimating and projecting recreational use, and recreation facility design load. Phase III - Apply the above procedures to statistically reliable mathematical model suitable for ADP treatment of those factors influencing recreation benefits and cost determinations.

Phase I is scheduled for completion by 1 August 1968 which will result in a recommended recreation survey for adoption throughout the Corps of Engineers. Interim results of Phase II study are presently being combined into a Recreation Planning Manual scheduled for completion by January 1969. Continuing studies of Phase III will be maintained using data from 52 reservoirs throughout the United States.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0079, GENERALIZED HYDROLOGIC DESIGN CRITERIA

A.J. FREDRICH, U.S. Army, Engineer District, *Sacramento, California* 95814

Greatly increased activity in water resources development in the United States and throughout the world, produces critical need for procedures for formulating generalized design criteria for water resources projects. This need is for less duplication of work and more uniformity of design in projects as well as for obtaining reliable design criteria in regions of little or no hydrologic data. This is an area where the United States can make a major contribution toward the International Hydrological Decade as well as toward the President's program of Water for Peace.

A draft of report on Hydrologic Design Procedures with particular emphasis on applications to areas of little data is in preparation.

Many generalized hydrologic relations such as envelope curves of rainfall and runoff amounts, intensity-duration relations, frequency relations, etc., have evolved from hydrologic investigations during the past 30 years or more. These relations will be re-examined and supplemented by more elaborate analyses made possible by recent development in mathematics, electronic computers and aerial photography in order to formulate basic procedures for deriving generalized hydrologic design criteria. This will be directed principally to determination of reservoir storage and outlet requirements, powerplant requirements, conveyance and terminal storage requirements, levee and channel sizes, and coordinated design of a water resources system.

SUPPORTED BY U.S. Dept. of Defense - Army

6.0080, SYSTEMS APPROACH TO WATER RESOURCE MANAGEMENT

J.R. BURNETT, T R W Incorporated, *San Bernadino, California*

The objective of the proposed study is to structure a process utilizing the systems approach which will examine the inter-relationship of the hydrological, engineering, institutional, legal, social, and economic facets of water resources. The process shall define, classify and inter-relate the activities necessary to achieve the objectives of water resource management. The resultant model would be the basis for establishing criteria, interface identification, decision parameter and finally resource allocation.

The proposed research involves estimating demand curves for recreation at selected existing water projects in California. The demand curves will be used to estimate recreational benefits by using the concept of consumer surplus.

6. WATER RESOURCES PLANNING

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

6.0082, PHYTOPLANKTON, SUSPENDED MATERIALS, AND TURBIDITY

R.W. HOLMES, Univ. of California, Graduate School, Santa Barbara, California 93018

The objective of the proposed research is to establish and evaluate the relationships between water turbidity and organic and inorganic particles concentration (i.e. seston) in a turbid inshore marine environment.

Visual observations have shown the existence of turbid water in the zone between the kelp and shore along the sparsely inhabited coastal region between Santa Barbara and Point Conception. Very high mussel growth rates have been observed in this zone, suggesting the existence and production of sizeable quantities of suspended organic materials which almost certainly contribute appreciably to water turbidity. The suspended organic material is probably locally produced by planktonic algae and/or by the fragmentation of kelp. The sources, relative contribution, and relationships between the inorganic and organic fractions of the seston and its correlation with water turbidity will be evaluated seasonally and geographically.

6.0094, USE OF WATER ON FEDERAL IRRIGATION PROJECTS

H.R. MCDONALD, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

THOMSON

This study is collecting data from representative farms throughout the Reclamation West, on an individual field and crop basis, and in sufficient detail and accuracy to allow reliable evaluation of present and attainable farm irrigation efficiencies. It was undertaken to evaluate the improve present design criteria for the sizing of storage and diversion facilities, outlet works, pumping plants, and conveyance systems. Data on irrigation water applied, precipitation, and surface runoff on an individual field basis for each irrigation are being obtained. Crop consumptive use is being estimated by a modified Jensen-Haise procedure using solar radiation and temperature data collected at the site. Present irrigation efficiencies are being evaluated and attainable efficiencies estimated on the basis of these data. Data being collected on irrigation and cultural practices will be used later in a more comprehensive analysis. Data on canal and lateral seepage losses are also being collected and analyzed in an attempt to improve present methods of estimating such losses in planning and design.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

6.0095, RESERVOIR AND RIVER OPERATION PROCEDURES

H.R. MCDONALD, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

A study to improve and develop procedures for the operation of reservoir and river systems to obtain optimum use of available water. This activity is directed towards evaluating stochastic hydrology as a tool for planning and sizing of project features and the development of procedures to program reservoir and project releases to optimize the use of available water.

6.0099, DESALINIZATION AND INTERREGIONAL STUDIES

W.W. REEDY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

To keep abreast of technological advancements in the field of water development, the Bureau is studying the potential of salt water desalination plants to determine costs for comparison with other sources of water. Field studies of plant locations, demands for water, and the economic and financial aspects are areas of study. Cooperation is maintained with the Office of Saline Water and the Atomic Energy Commission to obtain costs and feasibility of evaporators and energy plants.

A report entitled 'Siting Study on Large Nuclear Desalting Plants' was published in June 1967. This report investigated suitable sites and the economic incentives for large nuclear dual-purpose desalting plants.

Bureau personnel are currently participating on a U.S. team studying with Mexico the possible joint development of large nuclear dual-purpose plants.

6.0100, ECONOMICS OF WESTERN STREAMFLOW ACCRETIONS

R.L. ANDERSON, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: The general objective is to determine how the benefits of water conservation activities would be distributed on selected streams in the Missouri River Basin and other drainage areas in the Western States. Working objectives are: To assemble data on water rights on the streams under study; to identify the marginal water right holders; and to determine the effects of changes in streamflow on water users, considering both costs and benefits of such changes.

Approach: Records of water rights filed on irrigation streams are being collected from State and county records, and from major distributing agencies. This information will permit the identification of marginal water users, who would be affected most by changes in streamflow. Sample stream reaches will then be selected and the effects of changes in water availability in

6. WATER RESOURCES PLANNING

terms of changes in acreage irrigated, crops grown, and other changes in farm operation will be analyzed. Schedules of benefits and/or losses to water users on the sample streams will be analyzed.

SUPPORTED BY U.S. Dept. of Agriculture

6.0101, ECONOMICS OF ALTERNATIVE ROUTINES FOR DELIVERING IRRIGATION WATER

R.L. ANDERSON, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: The major objective is to evaluate routines for delivery of irrigation water to farms and fields within farms from the standpoint of economic efficiency and selected other decision rules or criteria.

Approach: A simulation program was designed in cooperation with the Graduate School of Public Administration of Harvard University. The program computes production, gross returns and net income from various systems of irrigation, enabling the researcher to determine the most profitable system on a per-farm and an aggregate basis. The program can evaluate up to 40 farms, each farm producing as many as 10 crops, with the irrigation season divided into 14 time periods. It simulates the decisions a farm operator would make according to various economic and other criteria in the course of an irrigation season where water availability is limited. The program is designed to consider the effects on crop yields when one or two irrigation waterings are missed.

6.0102, FISHES OF THE ARKANSAS RIVER BASIN, COLORADO

R.J. BEHNKE, Colorado State University, State Coop. Fishery Unit, Fort Collins, Colorado 80521

A survey of the fishes of the Arkansas River drainage will be conducted. Distribution and species composition will be related to changes in the aquatic environments precipitated by human use of the land and the water.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.
Colorado State University

6.0103, EFFECTS OF CHEMICAL VARIATIONS IN AQUATIC ENVIRONMENTS

W.H. EVERHART, Colorado State University, Graduate School, Fort Collins, Colorado 80521

Human population pressures and the ecological alterations that follow are the greatest challenge to worldwide natural resources management today. Whether habitat is removed by great highways or by subtle chemical changes, natural resource agencies are necessarily forced to provide for continuing production through increasingly intensive management.

Chemical alteration of our environment appears to be an integral part of our present and future civilization, and yet, too little background information is available on the natural chemical characteristics of our water resources and the changes we may expect in them. How then can we accurately assess the effects of man-induced changes in our waters ('pollution') without a base of extensive research data concerned with these natural variations and their biological effects? Increasingly more and more individuals are beginning to emphasize the idea that water is naturally polluted if you accept distilled water as a base.

The purpose of the research proposed herein is to gain some insight into the ecological impact of subtle changes in the chemistry of natural waters, utilizing fish as much as possible as indicator organisms. Correlative information of this kind would be of especial value to pollution specialists and fishery managers, but it should also find widespread application among other workers in both scientific and administrative echelons throughout the natural resources field.

6.0104, AN EXPLORATION OF COMPONENTS AFFECTING AND LIMITING POLICYMAKING OPTIONS IN LOCAL WATER AGENCIES

C.L. GARRISON, Colorado State University, Graduate School, Fort Collins, Colorado 80521

The project seeks to specify and assess the impacts of system elements and parameters which influence and restrict the effective range of options available to policymakers in local water agencies of Northeastern Colorado. The research is operationalized to measure, in comparative community and group contexts and on a sequential-interval basis over a three-year period, the relationships among policymaking sub-systems and (1) general community publics, (2) relevant special publics, and (3) other influential factors such as the legal framework and the economic systems. The major community classification schema for comparison categorizes communities along two dimensions, (1) levels of administrative development; (2) levels of community political participation.

6.0105, A STUDY OF THE SOCIAL MECHANISM OF RURAL-URBAN WATER TRANSFERS WITH SPECIAL REFERENCE TO EXTERNAL EFFECTS

L.M. HARTMAN, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 1. To investigate the institutional structure of water transfers in New Mexico and contrast the process there with that used in Colorado. Water transfers in Colorado are handled through a judicial process, while in New Mexico transfers are supervised by an administrative agency of the state government.

2. Conceptualize an analytical model in terms of which allocative efficiency of water supplies can be judged, giving specific consideration to the physical inter-relatedness of such supplies. In the framework of this model evaluate the relative merits of Colorado and New Mexico water right transfer process. 3. Estimate secondary effects resulting from water transfers from a well-developed, irrigated agricultural area and the costs associated with these effects.

Objectives (1) and (2) involve an investigation of transfer procedures in both states and an economic analysis of the procedures in terms of efficiency criteria. This analysis has been largely completed. Objective (3) required the empirical estimation of income and product flows within a regional economy. An initial study of this objective has been completed.

SUPPORTED BY Colorado State Government

6.0106, AN EXPLORATION OF COMPONENTS AFFECTING AND LIMITING POLICYMAKING OPTIONS IN LOCAL WATER AGENCIES - PHASE II

D.W. HILL, Colorado State University, Graduate School, Fort Collins, Colorado 80521

The research will be devoted to the investigation of how planning functions in hydrological systems are related to goal fulfillment. Systems will be selected and compared in accordance with a systematic design which employs local community and water agency typologies. Measures will be utilized within a framework of social attitudes, perceptions, and patterns of activity containing bases of support and opposition to the goals of the local water agencies.

6.0108, ECONOMICS OF GROUND WATER DEVELOPMENT IN THE HIGH PLAINS OF COLORADO

D.D. RONDY, Colorado State University, Graduate School, Fort Collins, Colorado 80521

Much of eastern Colorado depends upon a large underground reservoir for its water supply. This reservoir has a low rate of recharge and even if additional wells were not drilled, depletion of this reservoir would be possible. In recent years many agricultural wells have been drilled in this area. The proposed research is intended to describe alternative patterns of ground water development and to isolate the economic effects of each alternation on individual farms and on the area as a whole. Field investigations will be conducted to obtain data from present and potential users. These data will be used as the basis for economic programming models. The programming models will investigate static and dynamic conditions. The static-model will describe necessary on farm adjustments to a given set of conditions while the dynamic model will aid in determining optimum intertemporal adjustment patterns. Results of the empirical work will be used as an aid for making policy recommendations. The research will begin FY 66 and end in FY 69. Four years will be required to complete the work.

6.0109, STOCHASTIC STRUCTURE OF HYDROLOGIC SERIES

V. YEVJEVICH, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The general objectives of this research are the same as those sought by the investigator's previous work and may be summarized as follows: 1. To determine the structure in time series (continuous or discrete series) or other sequences of river flow and precipitation for any unit measure of discrete time series (i.e., day, month, year, or others) at various measures of other sequences; 2. To find the physical explanations for any deterministic component and dependent stochastic processes in these sequences; 3. To study regional distribution of hydrologic properties (stochastic regional processes); 4. To develop a better bridge between the statistical (probabilistic) and the geophysical approach to the analysis of runoff and rainfall sequences; 5. To study theoretically the problems of water storage with the development of new methods in storage problem analyses; and 6. To study various problems of stochastic processes encountered while studying under the above five objectives.

6.0111, STUDY OF THE RIVER PHASE OF THE LIFE HISTORIES OF ALOSA PSEUDOHARENGUS AND AESTIVALIS

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

To study the life histories of *Alosa pseudoharengus* and *aestivalis* under the most ideal field conditions available and then utilize the results in large river systems, like the Connecticut River, where an intensive study such as this would be extremely difficult to do.

In general, it is proposed to construct a weir at a narrow section of the brook to obtain: a. The range in temperature when the fish enter the stream. b. The size composition, sex ratio and age structure of the entering groups. c. The effects of illumination on the movements of the fish to the spawning grounds. d. An estimate of the total numbers of fish entering the brook. e. An estimate of the total numbers of fertilized eggs which might be produced. f. An estimate of the mortality rate of adults on the spawning grounds by estimating the total number of fish returning to the sea. g. Fish for marking. The objectives of the mark are: 1. To establish whether it is possible to estimate total numbers of fish on the spawning grounds by a mark and recapture study. 2. To determine length of time fish remain on the spawning grounds. 3. To determine the degree of homing, and 4. if a high degree of homing is found, estimate the mortality at sea.

6.0112, DEVELOPEMNT AND IMPLEMENTATION OF A MANAGEMENT STRATEGY FOR WATER RESOURCES RESEARCH

H.K. GAYER, Travelers Research Center Inc., Hartford, Connecticut

The proposed research involves the development of an overall research strategy for the planning and management of water resources research by OWRR. The project involves the following steps: 1) Development of an analytical or conceptual framework 2) Development of projections of relevant technical, economic, and demographic factors 3) Identification of water research problems 4) Development of research guidelines 5) Recommendation of research programs, areas of study, and associated study approaches.

The project will employ the 'systems' approach to deal with the complexity of the interactions and interrelationships inherent in the water resources research management problem.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

6.0113, PHYSIOLOGY AND BEHAVIOR OF LARVAE (PHYSIOECOLOGY OF SHELLFISH PROGRAM)

H.C. DAVIS, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

The development of routine methods for rearing bivalve larvae has enabled us to determine the effect of various ecological factors on larvae of the American oyster, *Crassostrea virginica*, and the hard clam, *Mercenaria mercenaria*. Studies have been made of the effect of the type and quantity of food, salinity, temperature, turbidity, pH, and of various pesticides and detergents on embryonic development and on growth of the larvae of these two species. In some studies we have observed the combined effect of varying two or more of these factors simultaneously.

We are currently experimenting to determine the pH range for spawning of oysters and the effect of the pH at spawning on viability of the sperm and eggs. We are also currently studying the effect of keeping oysters at lowered salinities, during gonad development and spawning, on subsequent embryonic development and larval growth at different salinities. We expect to soon have methods developed for studying the behavior of larvae and the effect of light, gravity, temperature, salinity and currents on the behavior of larvae of different ages and sizes. Such studies are urgently needed to develop an informational basis for field work on distribution of larvae.

6.0114, ECOLOGICAL FACTORS AFFECTING REPRODUCTION OF SHELLFISH (PHYSIOECOLOGY OF SHELLFISH PROGRAM)

H.C. DAVIS, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

This project has developed largely in an attempt to discover the origin and distribution pattern of the oyster larvae that set in Long Island Sound. Studies of the intensity of setting in the Bridgeport-Milford-New Haven area have shown that, while certain sections are more likely to get a heavier set than others, setting is usually very spotty, i.e., some sections may get a heavy set while nearby sections receive almost none at all. Plankton samples have shown that, even during the spawning season, oyster larvae are not numerous and that the earlier stages, 75-250 microns in length, are rarely encountered. The 250-325 micron larvae appear suddenly in the plankton samples and setting starts immediately.

At present we are attempting to locate the 'nursery areas' where these larvae develop to the 250-325 micron stage before they appear in Long Island Sound. Once these 'nursery areas' have been discovered, we shall attempt to determine the attributes that enable the larvae to develop there and to increase recruitment by replenishing the spawning stock in these areas.

6.0115, COMPETITION, PREDATION, AND BODY SIZE IN LAKE ZOOPLANKTON

J.L. BROOKS, Yale University, Graduate School, New Haven, Connecticut 06520

This research is an evaluation of the relationships between body size and relative competitive success of broadly related species of zooplankters. According to the size-efficiency hypothesis (Brooks and Dodson, 1965) the larger species tend to be the more successful competitors, but also the more vulnerable to predation. When predation pressure is low, the larger forms replace the smaller; when it is high, the reverse obtains.

The first phase of the research is a further examination of the effects that increasing the predation pressure by the introductions of planktivorous fish has upon the composition of lake zooplankton. Thorough, year-round samplings of the plankton before the introduction of alewives (*Alosa pseudoharengus*) and during their establishment should provide insight into the dynamics of the shifts in competitive dominance due to the increasing predation upon the larger zooplankters.

As the greater success of the larger of related cladocerans appears to relate to their superior ability to collect their fine particulate food, the second major phase of the proposed research will examine the efficiency with which cladocerans of various sizes can remove particles (esp. in 1-15 range) from dilute suspensions, and the range of particle sizes that each zooplankter can feed upon.

6.0116, INTEGRATION OF CONNECTICUT WATER RIGHTS LAWS AND POLLUTION CONTROL LAWS

R.L. LEONARD, Univ. of Connecticut, Institute of Water Resources, Storrs, Connecticut 06268

In the absence of a statutory definition of water rights Connecticut courts have settled conflicts according to common law principles. Meanwhile, the State Department of Public Health is responsible for protecting public health, and the Water Resources Commission is responsible for setting pollution control standards beyond those required for protecting public health.

Most municipal water supplies in Connecticut have been developed from high quality upland streams. The main stems of the larger rivers are generally being utilized only for purposes having medium or low quality requirements. As demands for water increase more intensive use and reuse of water will become necessary. An integration of water rights laws and water pollution control laws will be needed to facilitate more intensive utilization of Connecticut water resources.

A detailed and exhaustive review of existing water law in Connecticut will be prepared. This review will include constitutional provisions, statutes, court decisions, and administrative regulations pertaining to rights to use water, protection of public health, and pollution control.

Criteria will be developed for evaluating water laws and institutions. Consideration will be given to the allocation of water among competing uses, the process of reallocation, and the efficient adjustment to more intensive use and reuse of water.

The information and results of specific analyses will be brought together to identify legal and institutional changes needed to facilitate more intensive use of the water resources.

6.0117, FARMINGTON RIVER SHAD STUDIES

W.R. WHITWORTH, Univ. of Connecticut, Agricultural Experiment Sta., Storrs, Connecticut 06268

Objective: To determine the ability of a section of the lower Farmington River (1) to provide a migration route for American shad and anadromous salmonids, and (2) to hatch and rear eggs and young of the above fishes.

Procedure: Various points will be periodically sampled for plankton, bottom fauna, fish (eggs, larvae, and adults), selected chemical and physical characteristics, and a water sample taken back to the laboratory for routine bioassay. Data will be compared by analysis

SUPPORTED BY Connecticut State Government

6.0118, ECOLOGICAL PERIODICITIES OF NITROGEN AND PHOSPHORUS IN SALT MARSH FLORA AND SURROUNDING WATERS

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objectives: 1) To evaluate organic soluble and particulate nitrogen, nitrate, nitrite, total phosphorus, inorganic phosphorus, and salinity concentrations in the waters of a ditched and a natural salt marsh; 2) To evaluate concentrations of particulate organic nitrogen, nitrate, nitrite, total phosphorus, and inorganic phosphorus in the vegetation and edaphic organisms of the salt marsh; 3) To determine the significance (if any) of ecological season, lunar, diel, and diurnal periodicities on the flux of nitrogen and phosphorus within the marsh flora; 4) To consider the effects of precipitation on release of the plant nutrients into the salt marsh ecosystem; 5) To determine floral abundance of major species of spermatophytes in natural marsh and ditched marsh areas.

Procedures: Field samples of salt water marsh will be collected from selected stations in a ditched salt marsh and a natural salt marsh (natural-unaltered by man). Spermatophytes and edaphic algae samples will also be collected from the same areas. Spermatophytes will be harvested at the stem, the leaves will be placed in a plastic bag for later analyses. Edaphic algae will be collected on glass microscope slides placed on the marsh surface at least two weeks prior to the study. Three collections will be executed at equal intervals during each ecological season to evaluate water samples, spermatophytes and edaphic algae. Collections, for evaluation of diurnal cycles, will be performed every two hours during a twelve hour period. Diel periodicity will be evaluated with sampling each six hours for a twenty-four hour period. The effects of precipitation will be evaluated by collecting plant and water samples just prior to precipitation (predicted by U.S. Weather Bureau) and immediately after the precipitation has occurred. Lunar and seasonal periodicity will be evaluated through the three collections at equal intervals during each of the ecological seasons. These collection procedures are designed to facilitate statistical treatment of the data.

6.0119, ECOLOGICAL STUDIES OF WILDLIFE MANAGEMENT PRACTICES

E.P. CATTS, Univ. of Delaware, Agricultural Experiment Sta., Newark, Delaware 19711

6. WATER RESOURCES PLANNING

Long-range Objective -- To evaluate the ecological effects of management operations designed to improve or modify wildlife habitat. Immediate Objective -- To study wildlife usage and production on low-level-impounded tidal marshes in Delaware.

DESCRIPTION OF WORK: Study areas will consist of low-level and high-level impoundments as well as undisturbed salt-marsh. Intensive observations comparing the amount and kind of use made of these study marshes by vertebrate wildlife will be conducted at weekly intervals throughout the calendar year. Permanent observation points will be selected to place all low-level impoundments under surveillance. Other stations will be located on unditched and high-level impounded marshes for determination of comparative vertebrate activity. This census will include all birds, small mammals and fishes associated with the study marshes. Vertebrate usage will be related as much as possible to habitat or other environmental features. Local climate will be recorded and correlated with observed activity. Usage will be determined through such means as visual and audio observations, marking recapture procedures, and sign or fecal pellet analysis. Findings will be used to help determine the optimal pool and ditch sizes, the level at which low water should be held, and the influence of spoil deposits on vertebrate occurrence.

6.0133, LEGAL ASPECTS OF WATER RIGHTS IN THE EAST H.H. ELLIS, U.S. Dept. of Agriculture, Washington, District of Columbia

Object: To review the development and status of statutes, constitutional provisions and court decisions governing water rights in the 31 Eastern States. To study the relationships between water rights and economic, physical and administrative factors. To explore possibilities for improving the utilization of water resources.

Plan of work: A description and analysis will be made of all statutes, constitutional provisions and court decisions relating to water rights. The relationships of water rights to economic and physical factors and to watershed improvement programs will be analyzed. Consideration will be given to measures for attaining more beneficial use of limited water resources. Studies will include consideration of the contractual and other arrangements employed for irrigation purposes; and of the problems of irrigators in acquiring and exercising rights to use water from surface and underground sources. The results of each State analysis will be published separately and/or incorporated into reports covering several States, with significant inter-State comparisons.

Cooperation: State Experiment Stations; other State agencies; law colleges

SUPPORTED BY U.S. Dept. of Agriculture

6.0134, APPRAISAL OF LOCAL SOIL, WATER AND OTHER RESOURCE ORGANIZATIONS I. HANSON, U.S. Dept. of Agriculture, Washington, District of Columbia

Objectives: Analyze the organization, financing, operation, supervision, and coordination of resource and resource-related local organizations such as conservancy, recreation, wildlife, irrigation, drainage, watershed, soil conservation, forest preserve, and grazing districts and associations.

6. WATER RESOURCES PLANNING

Approach: An inventory is being made of the kinds and numbers of local resource organizations found in different States. Distinctive and significant types of local organizations will be selected for analyses. Individual organizations will be chosen for case studies. The analyses will include a review of relevant statutes, regulations, organizations' reports and files as well as interviews with local and State personnel and other informed persons. Relevant bulletins, research reports, journal articles, books, and pamphlets will be collected and reviewed.

SUPPORTED BY U.S. Dept. of Agriculture

6.0135, IRRIGATION AND OTHER PRODUCTION RELATIONS IN FLORIDA CITRUS ENTERPRISES **W. HENEBERRY**, U.S. Dept. of Agriculture, *Washington, District of Columbia*

Objectives: To estimate costs and returns from irrigation of citrus groves in Florida. A secondary objective is to determine the total acreage of cropland under irrigation in Florida and to identify trends in the use of irrigation.

Approach: Secondary data from the Census of Agricultural and other sources will be utilized as a basis for a general description of irrigation. The description includes the acreages of the various crops irrigated, type of irrigation, general trends in irrigation development, identification of areas of irrigated land, major sources of irrigation water supply, and values of crops harvested from irrigated land. Operations and characteristics of efficient irrigation systems will be estimated for specific soil and water resource situations in representative citrus-growing areas. Costs and returns will be estimated by applying appropriate prices of inputs and products to physical data under economically efficient irrigation systems.

SUPPORTED BY U.S. Dept. of Agriculture

6.0136, ECONOMICS OF WATER MANAGEMENT TECHNIQUES IN SOUTH DAKOTA **G.A. PAVELIS**, U.S. Dept. of Agriculture, *Washington, District of Columbia*

Objectives: To determine the economic feasibility of adopting recently improved irrigation technology for use on potentially irrigable lands in selected areas of South Dakota, and to estimate the impact of such adoption on the local economy of a selected area in South Dakota.

Approach: Potentially irrigable areas will be selected according to physical criteria of water supply and suitable soil types. Determination of water supply will include consideration of the extent to which water has been allocated to other uses by existing rights and allocations. Irrigation systems suitable for use in the selected areas will be determined and labor and capital requirements estimated for each type of system. Particular emphasis will be placed on recent improvements in irrigation technology in the selection process. Budgeting and linear programming techniques will be used to determine optimum economic organization of farms using the selected irrigation systems. Data requirements will be satisfied by existing data, communication with specialists and survey of farm operators if necessary. A specific area will be selected for an input-output type of analysis to estimate the specific impact on the local economy if the irrigation potential is fully developed.

SUPPORTED BY U.S. Dept. of Agriculture

6.0137, ECONOMICS OF WATER MANAGEMENT ON THE TEXAS HIGH PLAINS **G.A. PAVELIS**, U.S. Dept. of Agriculture, *Washington, District of Columbia*

Objectives: To determine optimum use of ground water based on expected demand-supply relationships in the High Plains. Working objectives are to appraise present patterns of agricultural production and water use; to estimate the production and remaining supply of ground water; and to determine the impact of declining water resources on the composition, quantity and cost of agricultural output in the region, and on agriculturally-dependent businesses.

Approach: Water production functions are being developed from hydrologic data, relating water yield to thickness of aquifer. Alternative enterprise budgets have been constructed for typical farm situations with respect to water supply. Linear programming techniques are being used to estimate optimum use of available supplies of water. Estimates of volume of business of farm-supply firms and other agriculturally-related firms are being developed.

SUPPORTED BY U.S. Dept. of Agriculture

6.0138, ANALYSIS OF RURAL ZONING ENABLING STATUTES AND ORDINANCES **E. SOLBERG**, U.S. Dept. of Agriculture, *Washington, District of Columbia*

Objectives: To appraise the status of and analyze developments in rural zoning enabling statutes and in zoning ordinances and to analyze what is being done under rural zoning ordinances.

Approach: Examination, analyses, and classification are made of all State rural zoning enabling statutes which empower counties, townships or other governmental units to adopt ordinances and regulations. Rural zoning ordinances and regulations enacted by local governmental units are collected, analyzed, and classified. Analyses are made of rural zoning as it relates to agriculture and natural resources uses. Special attention is directed at significant zoning innovations and related land use control techniques.

SUPPORTED BY U.S. Dept. of Agriculture

6.0139, URBAN AND METROPOLITAN STUDIES **A.C. GERLACH**, U.S. Dept. of Interior, Geological Survey, *Washington, District of Columbia 20242*

1. **Objective:** To develop the capability to provide data inputs for improvement of urban land use, better planning and utilization of transportation systems, regional development planning, and renovation of industrial areas for more efficient utilization of resources and accelerated technology.

2. **Approach:** Develop research strategy and techniques for the study of urban and metropolitan problems with the aid of remote sensing data of the types that could be obtained from space. This effort will utilize: a. Multiband photography - Color, and color infrared photography - Thermal infrared images - High resolution radar - Passive microwave - Scatterometer signature products.

3. Problems addressed by these studies include recognition of details of urban interrelationships, categorization of interrelationships as social/environmental pressure indicators and development of methodologies through which phenomena detection will be transmitted to the appropriate action agency.

4. Expected benefits include, but are not limited to, urban change prediction including: a. Land use change b. Transportation demands c. Population change d. Urban area service needs e. Establishment of techniques for urban thematic mapping.

5. a. Aircraft overflights will be needed at four different times of the year, at 8 locations. Both megalopolis and town structures should be accommodated by at least 32 flights for up to two hour periods. b. Ground truth would be provided by USGS teams and/or contractor teams operating within the experimental area.

Future efforts include techniques of change prediction, prediction of social land demand, transportation new capacities, urban signature keys preparation, and automation of urban analyses tasks.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0140, CARTOGRAPHIC MAPPING **T.A. HUGHES**, U.S. Dept. of Interior, *Washington, District of Columbia*

Objective: To study and evaluate applications of space photography, including Gemini photographs in preparing small and medium scale maps and mosaics, and to develop system specifications for space photography that may be used to compile maps at various scales.

Approach: To study methods and procedures for performing data reduction, annotation and image enhancement of space

6. WATER RESOURCES PLANNING

photography utilizing present know-how based on aerial photography and knowledge developed from investigations of distortions inherent in space photography. a. The sensor involved is the metric camera and Hasselblad camera; b. U.S. Geological Survey Topographic Division; c. Allocation of resources; 70% professional manpower; 26% equipment and materials; 4% overhead. The problem addressed by this study--The study seeks to determine methods of compiling data from space photography and to determine appropriate products e.g., maps, mosaics, etc. and the best cartographic treatment for each product to enhance its usefulness to natural resources investigations. The benefits expected are savings in cost and time, better utilization of manpower, faster mapping and an interpretative medium for natural resource studies offering both quantitative and qualitative information. Other support a. Research staff of the Topographic Division Research Center, McLean, Va. b. Processing and reproduction facilities of the Branch of Special Maps. Past studies of Gemini Photography, ultra-high altitude photography, resolution studies, and cost benefit studies have contributed to this project. Special instrumentation and techniques to obtain the most detail from space photographs will take three to four years but present instruments and techniques can be adopted to accommodate space photographs in one year.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0141, HYDROLOGY PROGRAM ADMINISTRATION AND SUPPORT

C. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objective: To investigate the feasibility, utility and significance of remote sensing of hydrologic phenomena from Earth orbiting spacecraft. The field study of test areas by conventional methods and remote sensors. To achieve the ability to interpret aircraft and spacecraft data. To formulate and develop the capability to conduct a series of experiments to provide useful data for the study of water resources.

Approach: Establish scientific/technical research support offices for hydrology to a) assist in mission definition, b) formulate experiments, c) coordinate investigations to develop experiment capability by universities, Government agencies and private industry, d) correlate and integrate flight experiments. To acquire and correlate data from aircraft and later Earth-orbital spacecraft over selected test sites in which the hydrologic features are well known. To interpret data using standard techniques and develop new techniques.

Status: The U.S. Geological Survey has established a coordinating staff. There are now approximately 40 hydrological sites involving a large number of earth scientists. A number of technical letters describing laboratory, field and remote sensor data investigations have been submitted since inception of the program in 1965. These reports include descriptions of the use of data from Gemini and Nimbus satellites, ultraviolet imagery, black and white, color and multiband photography, infrared and radar imagery. A number of user experiments have been developed and submitted to the Earth Resources Survey Program Office.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0142, HYDROLOGIC ANALYSIS OF LAKE SYSTEMS AND OF GLACIERS

C. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objective: 1) To investigate the feasibility, utility and significance of remote sensing of various parameters of lakes as applied to regional studies of the water resources of lakes 2) to determine the annual budget and other features of glaciers as related to climate indicators and to sources of water supply.

Approach: 1) Determine the relationship of reflected and emitted electromagnetic radiation of lakes to their chemistry, biology, ecology, and sediment content. Studies will be conducted over the Salton Sea, Lake Colorado City, Texas, Roxboro Reservoir, N.C, Florida Everglades. 2) Investigations will be conducted over South Cascade Glacier, Wash. to obtain information on snow accumulation. These studies will be undertaken using IR scanners, imagers, and multiband photography from aircraft.

Status: The U.S.G.S. is currently working on the South Cascade Glacier Project and several flights have been made by NASA aircraft over this site.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0143, ESTUARIES AND SHORE STUDIES AND WATER SURFACE INVESTIGATIONS

C. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objectives: To determine the hydrologic environment parameters of the coast and continental shelf areas that can be determined by remote sensing. To determine the feasibility of measuring thermal loading, evaporation, and distribution of river effluents and to determine the physical properties of water indicating pollution by remote sensing.

Approach: Various remote sensing techniques including those of infrared and photography will be used to determine the most effective means of obtaining data. Experiments will be conducted in the following areas; Potomac and Patuxent estuaries, Cook Inlet, Alaska, Delaware Estuary, Barnegat Bay, N.J., Connecticut River, Hudson River, Lehigh River, Missouri River and others.

Status: The work proposed is well established as tests and experiments have been carried out in the field for the past 6 years. This study will further refine and develop the method.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0144, WATER EXPLORATION AND MAPPING

C. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objectives: To define the physical boundaries of natural water systems and their relationship to present and potential development activities.

Approach: Investigate the basic physical properties and relationships at the boundaries of natural water bodies and systems by methods leading to the development of remote sensing instrumentation for use in the measurement of phenomena at water boundaries.

Status: A new effort. Development will be based on the research capabilities of universities and other organizations.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0145, WATER QUALITY, STUDIES AND AERIAL MEASUREMENTS

SKOUGSTAD, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objective: To determine the extent to which the chemical and biological characteristics of water in rivers, estuaries, and reservoirs can be determined by the use of remote sensing instruments. Determine the application of multiband remote sensing to various problems in hydrology.

Approach: 1) Fundamental studies will be made to determine the relationship between the reflection, refraction, and absorption of laser beams and quality of water. 2) Stimulated luminescence in tracer studies will be the subject of investigations in flow dispersion coefficients and of pollution indices. 3) Utilize TV cameras sensitive to various wavelength bands to determine the significant information in each.

Status: Work in multiband research has been conducted for the past three years at the Phoenix Office of the U.S.G.S. NASA and U.S.G.S. aircraft will be utilized.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0146, COORDINATION AND LIAISON AT MANNED SPACECRAFT CENTER, HOUSTON

UNKNOWN, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objectives: 1) To provide continual liaison and coordination between MSC Houston and USGS-Washington, Denver, Flagstaff and Menlo Park. 2) To assist on the monitoring of U.S.G.S. instrument development contracts (UV, IR and Magnetics), 3) Pro-

6. WATER RESOURCES PLANNING

vide coordination for test site overflights by the NASA aircraft for geology, hydrology, geography and cartography disciplines.

Approach: To assign an experienced member of the U.S. Geological Survey on two year assignment to the office of Dr. W. Hess, M.S.C. Houston to represent the Director, Research Coordinator, EROS Program and Chief Geologist in air and space activities.

Status: Projected increase of activity under the Earth Resources Survey Program and increased responsibility of the Houston facility make it imperative that closer coordination be maintained between MSC and USGS.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0147, GEOTHERMAL INVESTIGATIONS - YELLOWSTONE PARK

WHITE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objective: 1) To provide detailed surface and subsurface investigations of geothermal springs in Yellowstone National Park to provide the background data required to thoroughly interpret and understand remote sensor data acquired from air and spacecraft.

Approach: 1) To conduct detailed surface investigations of geothermal springs and their surrounding geologic environment. 2) To conduct seismic, gravity and magnetic surveys to define anomalous subsurface conditions. 3) To conduct a limited amount of shallow to moderate drilling to sample spring sources at depth for chemical, mineral and isotopic analyses to provide three dimensional temperature information, to conduct electrical resistivity surveys to determine source rock location and conditions.

Status: A continuing project approaching completion. Surface studies of cauldrons ashflows and geophysical surveys have been essentially completed but need to be correlated with remote sensor data. Drilling is underway and will be completed during the current field season under existing funding. Future funds (FY68) will provide for a final report correlating results with available imagery, if provided by MSC Houston.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

6.0148, DISTRIBUTION, ABUNDANCE, TAXONOMY, AND BIOLOGY OF MOSQUITOES AFFECTING AGRICULTURE

C.H. SCHMIDT, U.S. Dept. of Agriculture, Gainesville, Florida

Object: To obtain more information on the biology, taxonomy, and distribution of various species of mosquitoes under irrigation, flood, and marsh conditions to aid in the development of effective control measures.

Plan of Work: Both field and laboratory studies on the biology and behavior of numerous species of mosquitoes, especially in California, Oregon, Louisiana, and Florida, will be made. Special attention will be given to mating and resting habits of various species in the field so as to obtain basic knowledge on how to use chemosterilants and radiation for control. Natural foods of larvae and pollen foods of adults will be studied in both the laboratory and the field. Studies, particularly in California, will emphasize the relation of water management to oviposition and larval habits. Efforts will be made to determine the overwintering habits and behavior of various species. Identification studies to develop means of separating species will be done as time permits. Special attention will be given to flight behavior, dispersal and population densities and dynamics to develop basic data for the development and evaluation of new approaches to mosquito control. Cooperation is maintained with State agencies in California, Oregon, New Jersey, Florida and other States, with the Tennessee Valley Authority, Public Health Service, Armed Forces Pest Control Board and mosquito control districts.

SUPPORTED BY U.S. Dept. of Agriculture

6.0149, APPLIED CRITERIA FOR MUNICIPAL WATER RATE STRUCTURES

N.G. KEIG, Univ. of Florida, Graduate School, Gainesville, Florida 32601

The research will attempt to develop applied criteria for municipal water rates. Empirical work that has been completed will be synthesized and related to the problem of water rate design. The efficiency of alternative rate designs in achieving various objectives--economic efficiency, equity, financial--will be evaluated and the nature of the conflicts between competing objectives will be examined. The research will seek to answer specific questions concerning elasticity of demand and supply by reference to existing data and seek to provide authoritative answers to the questions that arise in rate design. The research will supplement the Water Rates Manual and provide a guide for local officials.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

6.0150, PREDICTION MODEL FOR WATER USE BY POPULATION STRUCTURE

D. KUBAT, Univ. of Florida, Graduate School, Gainesville, Florida 32601

The investigators propose to construct a water consumption model with indicators of attitudes to water consumption for current and projected populations in the West Palm Beach-Miami urbanized area and in the Biscayne Beach agricultural irrigation area. (See map attached.) The prediction model is to control the variable of water use and socio-economic status, and is to be geared to the population projections for the next five, ten, and twenty years to come.

The project is to test the direction of the relationship between water consumption and socio-economic status. The data are to be obtained from census information and from a residential stratified probability sample of five hundred residential units in the two areas. Also, panel study on attitudes and attitude changes to alternate water sources is built into the project, the panel study being scheduled to last for three years and to yield information about the change agents and diffusion of ideas related to water use and water conservation. The fiscal year of the central project is 1968, completion of the project being expected by August 1968.

6.0151, MODEL WATER USE ACT FOR THE STATE OF FLORIDA WITH COMMENTS

F.E. MALONEY, Univ. of Florida, Graduate School, Gainesville, Florida 32601

This proposed project is the preparation of a model water use act for the State of Florida with comments. The investigators propose to study and analyze all available water regulatory legislation now in force in other American jurisdictions, and, following this analysis, to draft appropriate model legislation for the State of Florida accompanied by comments as to why particular legislation was proposed. The specific objective of the project will be to provide a modern and practicable system of water regulation for a state with abundant but unbalanced water supplies. The proposed legislation will be designed to encourage maximum development of the state's water resources consistent with the protection of existing property rights. The model act will take into account the role of state administrative agencies in water resources management and try to develop better legal devices by which maximum beneficial use can be made of the state's water resources for both consumptive and non-consumptive purposes. The proposed Florida model water use act will be designed for comprehensive study and consideration by federal, state and local governmental agencies interested in the protection and fair allocation of water resources within a state or hydrologic region (such as a river basin) which may transcend state boundaries. In framing the proposed model act the investigators propose to take into account insofar as practicable all known major water resources problems within the state of Florida.
